(3.) The thermal efficiency of the system will be small, as much of the heat produced in the pipe stove will go up the chimney, and the fuel-consumption will in consequence be high.

(4.) The pipe stove will be costly to build and to maintain, as the pipe will burn out rather quickly.

(5.) It does not seem probable that the circulating gases will deposit carbon in the coke or charcoal, as claimed, because they must first pass through the pipe stove, which must be at a higher temperature than the fuel, and they are more likely to decompose and deposit carbon in the pipe stove. It is conceivable, however, that the coke or charcoal may in some way cause the deposition of carbon in itself, even though the gas has previously been exposed to a higher temperature.

Mr. Thomas has shown me samples of his carbonized charcoal, which is certainly a very satisfactory product. He has not, however, as far as I am aware, published or patented his method of making this dense product, and I have no reason for supposing that it can be done economically on a large scale.

In conclusion, although I am not prepared, on the information at my disposal, to recommend the processes and apparatus of Mr. Thomas for commercial operation, I recognize his ingenuity as an inventor, and think it quite likely that some of his ideas, if carefully tested and applied, may prove fruitful. Since returning to Montreal I have heard from Messrs. McPherson and Fullerton Bros., of Vancouver, who have taken over the Thomas patents and have been making some tests at the Nanaimo plant. I have received from them samples of charcoal made from fir-wood in the large retort. The operation was stated to occupy only six hours and the charcoal appears to be of satisfactory quality. I have also received from them some small briquettes made from charcoal powder by the Thomas process. They state that they can obtain mill-waste for a few cents per cord; and apparently they can make charcoal at a cost of about $5 per ton.

SUBSTITUTES FOR CHARCOAL IN ELECTRIC SMELTING.

Coal and Coke.—For the purpose of this investigation I have been furnished by Mr. Wm. Fleet Robertson and others with information with regard to the supplies of coal and coke in British Columbia. In view of my belief that charcoal will be the main reducing agent in the electric smelting of iron ores in this Province, I have not paid much attention to the supply of other fuels. Coke can be used to some extent in admixture with charcoal, and coal or oil would be needed for the operation of open-hearth and other furnaces.

The following information with regard to the supply, analysis, and price of coal and coke was supplied by Mr. W. F. Robertson under date of June 5th, 1918:—

Vancouver Island.—Monthly coal production, 145,000 tons; price per ton, $2.50 to $5.86, depending on grades. Monthly coke production, 3,000 tons; price, $10.25 per ton.

The coke contains 74 per cent. fixed carbon, 3 per cent. volatile matter, 23 per cent. ash, and 1 per cent. sulphur; but under improved conditions coke could be made that would contain 84 per cent. fixed carbon, 3 per cent. volatile matter, 13 per cent. ash, and 1 per cent. sulphur.

The following information with respect to the Nicola Valley coal was supplied to me by Mr. Nichol Thompson under date of June 10th, 1918:—

"The Nicola Valley coal produces a superior metallurgical coke with well-developed cell-structure and ample strength for iron-furnace stacks. From English coking tests the following results were obtained:—

	From Raw Coal.	Coke produced in:—	
		Bee-hive Ovens.	Retort Ovens.
	Per Cent.	Per Cent.	Per Cent.
Moisture	3.40	1.20	1.00
Volatile matter	34.90	1.20	0.50
Fixed carbon	56.70	84.00	91.25
Ash	5.00	13.60	7.00
Totals	100.00	100.00	99.75
Sulphur	0.65	0.63	0.25"

From another source in England:—

"The coal sent to me and numbered 1 is a very fine coal for metallurgical, steaming, or domestic purposes. We can take away every trace of sulphur if necessary, and it would then remain a splended metallurgical coke, supposing you had a steel plant in British Columbia. I should imagine that this No. 1 sample is about the highest-grade coal you have in Canada, and it should be used as a superior coal when British Columbia has commenced steel production. In other words, it is a coal which will find higher values as British Columbia develops. The other coal, main coal and numbered 2, seam 1, carried 38 and 40 per cent. volatile matter, and are excellent for oil and motor-spirit production, and for the production also of an excellent coke either for ordinary household fuel or for metallurgical work. The oil extracted from the coal would depend entirely on the grade of coal which you wished to produce. The coal could be distilled to destruction or any stated quantity of hydrocarbons could be left in the coke. I enclose you a sheet showing the product from 1 ton of Nicola Valley coal obtained from a by-product oven. There is no question as to the success of the by-product coke-ovens, as evidenced by the fact that the entire coal product of Germany previous to the war was made into coke so that the products might be saved."

Mr. Thompson gave me further information with regard to the chemical by-products obtainable in the coking of the Nicola coal, but it does not seem suitable to discuss these in the present report.

Gas-retort Residue.—The electric-smelting plant at Bay Point, San Francisco, employs for reducing reagent in the production of ferro-alloys a carbonaceous residue produced in the manufacture of illuminating-gas from oil. This material is practically ash-free, it contains about 70 per cent. of fixed carbon, and is obtainable at a nominal price of about $4 a ton. It is not very satisfactory physically, but in view of the scarcity of charcoal and coke in that locality the management have been obliged to use this residue and have overcome the difficulties attending its use.

Comparison of Coke and Charcoal.—The comparative values of these as reducing materials depend in the first place on their fixed-carbon content. Thus, if charcoal contains 73 per cent. of fixed carbon and coke 84 per cent., the coke would appear to be the more valuable. The remainder of the charcoal, however, is volatile matter and moisture, which is driven off harmlessly in the furnace, while the coke would contain some 13 per cent. of ash, which has to be melted, and will usually necessitate the addition of a flux. The sulphur in the coke also will need fluxing, in addition to lowering the purity of the resulting pig-iron. It follows, from these and other considerations, that charcoal is somewhat more valuable than coke as a reducing reagent. Referring to Mr. Gronwall's estimate in my Swedish report, the following figures show the relative consumption of fuel and of electric power for 1,000 kilograms of pig-iron, according as charcoal or coke are employed:—

	Using Charcoal of 73 Per Cent. Carbon.		Using Coke of 85 Per Cent. Carbon.	
	Kilos Fuel.	H.P. Year.	Kilos Fuel.	H.P. Year.
White pig-iron	340	0.37	370	0.39
Grey pig-iron	370	0.40	400	0.42

It will be clear from this table that not only is there a larger consumption of coke than of charcoal per ton of iron, but the power consumption is larger with coke.

In localities where coke is of good quality, cheap, and abundant, while charcoal is expensive and scarce, it may be worth while to use coke on account of its greater cheapness. In British Columbia, however, it appears that charcoal should be made at a cost of $6 to $8 a ton, while coke would cost about $10 a ton. As long as these conditions last there can be little doubt that charcoal will be preferable as a reducing agent in electric smelting.

APPENDIX VI.

ELECTRODES.

Electrodes are needed in most electric furnaces for conducting the electric current into the furnace. They should be good conductors of electricity and poor conductors of heat, and they should be strong and capable of withstanding high temperatures. Electrodes are usually made of some form of carbon, and their wear in the furnace, from exposure to air or to other oxidizing materials, constitute a serious source of expense. The cheapest kind of electrodes are "carbon" electrodes, which are made of some form of carbon, such as crushed anthracite coal, bonded together with pitch, and baked. "Graphitized" electrodes are obtained by heating carbon electrodes to a very high temperature in an electric furnace. The process converts the amorphous carbon of the electrode into graphitic carbon, which is a much better conductor of electricity, and is superior in some other respects. Graphitized electrodes cost about three times as much per pound as carbon electrodes, and the latter are therefore more generally used in electric smelting.

The electrodes used in the Swedish furnaces at the time of my visit in 1914 were 24 inches in diameter and 4 or 5 feet long. They were provided with threaded ends, so that fresh lengths could be added as the electrodes wore away. They were of amorphous carbon and cost about 4 cents per pound. The consumption of electrodes, when making white pig-iron from high-class ores, was about 10 to 15 lb. per ton of pig-iron; thus costing about 50 cents per ton of product. In melting lower-grade ores for foundry iron the consumption might be from 15 to 20 lb.; at present prices in British Columbia this would mean about $1.50 per ton of pig. A furnace of 3,000 kw. uses six of these 24-inch electrodes.

At Bay Point, California, the 3,000-kw. open-pit furnace, smelting ferro-manganese, uses three 24-inch carbon electrodes. The consumption is 100 lb. per ton of ferro-manganese, and Beckman and Linden expect that in using this furnace for making pig-iron the consumption would be 20 lb. per ton.

It will be noticed that the Swedish furnaces have twice as many electrodes as the Californian furnace. The size and number of the Swedish electrodes are in agreement with the generally accepted formulæ of Dr. Hering, and it seems likely, therefore, that the Californian furnace should have more electrodes if it is to be used for iron-smelting. Beckman and Linden do not agree with this suggestion, and, of course, these points must ultimately rest on practical demonstration, but it must be remembered that they have not as yet applied their type of furnace to smelting iron ores.

At Heroult, California, a 3,000-kw. ferro-manganese furnace is furnished with four 12-inch graphitized electrodes, which would be about the same in effect as the three 24-inch carbon electrodes at the Bay Point plant. Judging by the consumption of electrodes at this point, it appears that it would be preferable to use carbon electrodes, and I understand that this change will be made.

Under ordinary conditions carbon electrodes cost 3 or 4 cents per pound, but at the present time the price in the East is about 8 cents and on the Pacific coast nearly 10 cents. In view of the expense of shipping electrodes across the continent it is desirable to make electrodes locally, but this should not be undertaken until the smelting plant is in good running-order, because the manufacture of electrodes is not easy, and the use of poor electrodes might delay, seriously, the operation of the plant. Messrs. Beckman and Linden have put up an electrode plant at the Bay Point plant, and they are trying to make electrodes from the carbon residue, which they use as reducing material in the furnaces. They prepared for me the following estimates of the cost of plant and of making electrodes:—

300-ton-per-month Electrode Plant.

Baking-kilns complete, including all burning apparatus	$ 20,000
Hydraulic press (500 tons per month, 600-ton pressure)	6,000
Mixers (two)	6,000
Moulds	5,000
Calciner complete	40,000
Building complete	25,000
Crane	8,000
Conveying equipment and elevators	2,500
Crushing and screening apparatus	3,000
Kiln-sand	1,000
Tools, chains, etc.	1,000
	$118,500
Contingencies, 10 per cent.	11,850
	$130,350
Beckman & Linden Engineering Corporation fee	15,000
Total	$145,350

Cost of making 2,000 Lb. of Electrodes.

Anthracite coal, calcined, crushed, and sized	$20 00
Pitch at $20 per ton put into electrodes	5 00
Baking fuel, pound per pound ratio	4 50
Labour, 50 cents per hour	12 75
Operating superintendence	1 85
Supplies	1 00
Maintenance	2 00
Plant office expense	75
Main office expense	4 00
Total	$51 85

Cost per pound, $0.0258.

The iron-smelting plant under consideration for British Columbia was to have two 3,000-kw. furnaces making pig-iron and three 300-kw. furnaces making ferro-alloys. The consumption of electrodes in these furnaces would amount to 1,000 or 1,500 lb. daily, or about 20 or 25 tons per month. This is less than one-tenth of the output of the plant described above, and the cost of making electrodes in a smaller plant would necessarily be somewhat higher, say 3 or 4 cents per pound.

APPENDIX VII.

THE SUPPLY OF LABOUR.

Although a supply of competent labour is essential to the success of any industrial undertaking, and although the variations in the wages that must be paid may mean the difference between profit and loss, it is impossible for me at the present time to put forward any really reliable information with regard to labour conditions in British Columbia.

The Department of Labour in Victoria has furnished me, through Mr. W. Fleet Robertson, with a statement of the supply, nature, and cost of labour in the Coast District of British Columbia; this statement is added in the following pages. It will be seen that there is a fair supply of labourers at nearly $4 a day, and that most skilled men are scarce at about $6 a day. The cost of labour per ton of iron depends very much on the size and output of the plant. Thus, at the figures mentioned, in a fully equipped plant making 50 or 60 tons of pig-iron, and steel and ferro-alloys as well, the cost of labour might be $4 or $5 per ton of iron, but if only one or two furnaces were operating the labour cost might be about $7 per ton of iron.

While electric furnaces offer difficulties and dangers of their own, it appears to me that a well-established electric-smelting plant, such as those I saw in Sweden, presents far less difficulty

and discomfort to the workman than the average blast-furnace plant, and that the management should experience less difficulty in keeping a good crew of men.

On page 34 of my Swedish report it is stated that at Hagfors three 3,000-horse-power furnaces are operated by fifty men, working eight hours daily, at a wage of about 12 cents per hour. At this rate, with bonuses and the higher rates of foremen, the cost would amount to about 80 cents a ton of pig-iron. In a plant of three 3,000-kw. furnaces in British Columbia fifty men might be assumed to cost: Thirty at $4 and twenty at $6, or $240 a day. With an average output of 75 tons daily of foundry iron this would mean $3.20 per ton. A plant of this size would probably need a few additional men, say ten or twelve, which would increase the charge for labour to about $4 a ton.

Messrs. Beckman and Linden have given me a list of the men needed daily for one 3,000-kw. furnace of the open-pit type. I have added to these the rates of pay, estimated with the aid of the attached memorandum:—

Daily Labour for One 3,000-kw. Pit Furnace.

One furnace foreman at $8	$ 8 00
Twelve furnacemen at $5	60 00
One chief electrician at $6	6 00
Three sub-station operators at $5	15 00
Three mechanics at $6	18 00
Six mixing-men at $4	24 00
Six metal-handlers at $4	24 00
Two locomotive-crane men at $5	10 00
Total	$165 00

With an output of 25 tons per day this would mean $6.60 per ton of iron, which agrees with Beckman and Linden's estimate in Appendices X. and XI. This charge is unduly high, because they figured on a single furnace only. A plant having three furnaces would only need about twice as many men as a plant with one furnace, so that the cost for labour would be about $4.40 per ton.

MEMORANDUM FROM DEPARTMENT OF LABOUR, VICTORIA, B.C., JUNE 10TH, 1918.

Supply, Nature, and Cost of Labour, Coast District of British Columbia, such as would be required at Plant for Electric Smelting of Iron.

	Normal Pre-war Conditions.	Present Conditions.	
	Wages per Day of Eight Hours.	Supply Plentiful or Scarce.	Wages per Day of Eight Hours.
Engineers, 1st	About $15 less than at present	Scarce	$225 per month of 26 working-days.
Engineers, 2nd	...	Scarce	$165 per month of 26 working-days.
Machinists	$4.00 per day	Scarce	$6.00 per day.
Machinists' helpers	2.50 per day (Not quite sure)	Scarce	4.50 per day.
Boiler-makers	$4.50 per day	Scarce	6.00 per day.
Boiler-makers' helpers	3.25 per day	Scarce	4.30 per day.
Blacksmiths	4.50 per day	No great supply	6.00 per day.
Blacksmiths' helpers	3.25 per day	No great supply	4.50 per day.
Plumbers and pipe-fitters	5.00 per day	Scarce	6.00 per day.
Plumbers' and pipe-fitters' helpers	3.25 per day	Scarce	4.00 per day.
Painters	4.00 per day	No great supply	5.50 per day.
Electrical workers	5.00 per day	Very scarce	6.00 per day.
Electrical workers' helpers	3.50 per day	Very scarce	4.00 per day.
Operators of electric, steam, or air winches and donkeys	4.50 per day	Scarce	6.60 per day.
Engineers in charge of boilers	4.00 per day (Not quite sure)	Scarce	5.50 per day.
Labourers	$3.00 per day	Supply fair	3.85 per day.
Sheet-metal workers	...	Fair	6.60 per day.
Coppersmiths	...	Fair	6.60 per day.

APPENDIX VIII.

TYPE OF FURNACE TO USE FOR ELECTRIC SMELTING.

The furnaces that have been in commercial use, or that seem suitable for the electric smelting of iron ores, are:—

(1.) The Electric-Metals furnace used in Sweden:
(2.) The Helfenstein furnace tried in Sweden.
(3.) The Noble Electric Steel Company's furnace used at Heroult, California; and
(4.) The 3-phase open-pit furnace used for ferro-alloys.

The simplest of these is No. 4, the open-pit furnace. This furnace has no roof or cover and has three electrodes, which are supported from above and are surrounded with the material to be smelted. The main objection to this furnace is that heat and gases escape from the furnace and are lost, besides creating a nuisance. As far as I am aware, this furnace has not been used commercially for smelting iron ores. Nos. 2 and 3 are like No. 4, except that the top of the furnace is closed in, thus lessening the loss of heat and enabling the gases to be drawn away through flues and used elsewhere for heating. Both these furnaces have been used on a commercial scale, but full particulars of their operation are not available. No. 1 is more elaborate than the others and resembles an iron blast-furnace with an enlarged hearth. In this type, not only is the furnace closed to retain the heat and the gas from the smelting charge, but the gases are made to pass up a shaft, so as to heat and reduce the iron ore; being, indeed, returned again to the furnace for this purpose after escaping at the top. This furnace has been in successful commercial use for a number of years in Sweden, and some are now being built in other countries.

In this Appendix I give references to a number of descriptions of these furnaces, and compare the available data with regard to their operation.

I. Electro-Metals Furnace.

An illustrated account of the furnace and plant at Trollhattan, entitled "Recent Progress in Electrical Iron-smelting in Sweden," is given by T. D. Robertson in Amer. Electrochem. Soc., 1911, Vol. XX., page 375. Full illustrated reports of the work at Trollhattan by J. A. Leffler, E. Odelberg, and E. Nystrom are given in Swedish in the *Jern-Kontorets Annaler* for 1911, 1912, and 1913. Translations of parts of these appeared in *Iron and Coal Trades Review*, June 9th and 16th and November 10th, 1911, and May 2nd, 1913, Vol. 86, page 744. Articles entitled "Electric Iron Smelting" by Jens Orton-Boving appeared in the *Canadian Engineer*, December 18th, 1913, Vol. XXV., page 877, and in *Iron Age*, May 21st, 1914, Vol. 93, page 1269. The Swedish and other furnaces for the electric smelting of iron ores are described in my book, "The Electric Furnace," 1914 edition, pages 174-211, and in my report on "Electrothermic Smelting of Iron Ores in Sweden," Ottawa, 1915.

The following account of the Swedish furnace and process is from a memorandum by J. O. Boving dated July, 1915:—

"*Reduction of Iron Ore.*

"The methods and processes for obtaining pig-iron by electric reduction have mainly been worked out and put to commercial use in Sweden, but in a smaller degree the United States of America and Canada have contributed towards the experience gained. (Experiments have also been carried out in France and in Switzerland, but no commercial results have matured so far.) The reason for this is fairly obvious, as the development is based on the following cardinal conditions: Presence of cheap water-power and suitable charcoal.

"Sweden's iron trade has been based on the production of high-class charcoal pig since the earliest days of established industry, and it is chiefly on account of the high quality thus produced Sweden became famous for these products.

"Before the new processes of making steel in open-hearth and Bessemer converters were known, Sweden commanded high prices for her iron, but prices fell with the development of newer methods, and Sweden had to seek other ways in order to cheapen the cost of production and at the same time maintain the quality. Such means were found in the electric-reduction furnace. Sweden has an abundance of cheap water-power, and there are few countries in the world that have taken such beneficial advantage of it.

"The first electric-reduction furnaces were established in 1907. Now a great number of them are working and giving splendid results, as will be seen below.

"In Russia there are large districts where the conditions are similar to those in Sweden, and I am strongly of the opinion that developments could as profitably be made in the Urals, and maybe also in the Caucasus. The iron industry is already well established in the Urals. The ore is good. There is an abundance of water-power which would be easy to harness, and the supply of wood for charcoal is practically unlimited.

"As mentioned above, the development of electric reducing has been most marked during the last few years in Sweden. At present some fourteen high furnaces are in operation, and the total output represents about 140,000 tons of pig-iron per annum. This pig is of the highest quality that can be made, and it commands, therefore, high prices. It is mostly used in Sweden for producing high-grade steel, but a certain amount is also sold to the Sheffield market.

"There are, further, many more installations contemplated, and it is safe to say that wherever there is cheap water-power the old blast-furnace will be replaced by electric producers. Generaly speaking, it holds good that wherever 1 horse-power per annum can be produced cheaper than the cost of 2 tons of charcoal or coke (depending upon the class of iron to be made) it is a commercially successful undertaking to substitute electric heat for fuel-heat.

"The system of furnace which is used throughout Sweden is that patented by Electro-Metals, Limited.

"It will be seen that the furnace consists of two principal parts—the furnace-shaft and the hearth or crucible. The shaft, which is of similar design to an ordinary blast-furnace shaft (but, of course, without any blast-tuyeres), is supported independently on an iron framework or on heavy girders resting on the walls of the furnace-house. It consists of a shell of steel plates and is lined with firebrick. It is provided with a closed furnace-top, the charging-bell of which is raised or lowered by means of an electric motor and winding-drum. The hearth, which is situated immediately below the shaft, is so constructed that when it is expanded by the heat the central hole in the arch which covers it fits closely around the neck of the shaft.

"The hearth also consists of a strong shell of steel plates lined with refractory material and is covered by an arch, the weight of which may be supported entirely on the circular lining of the hearth, or else partly in this manner and partly by iron straps riveted to the shell of the shaft.

"The electrodes are preferably of circular section and provided with screw-joints for joining up end to end. They pass through the arch of the crucible at a slight inclination from the vertical. Water-cooled stuffing-boxes with asbestos packing are provided to prevent leakage of gas around the electrodes. The electrodes project into the hearth through the free space between the roof and the charge, which on descending into the hearth falls at an angle from the lower end of the shaft. The electric current is supplied to the electrodes through bronze contacts. Only carbon electrodes have, so far, been used owing to the high costs of graphite electrodes.

"The Electro-Metals furnaces are generally provided with an arrangement for gas-circulation, the gas being drawn by means of a fan from a gas outlet at the upper end of the shaft and forced through a number of nozzles into the free space between the roof of the crucible and the descending charge. The object of this gas-circulation is twofold—viz., to prevent overheating of the roof of the crucible and to facilitate the reduction process in the shaft. As regards the latter object, it is evident that the gas which becomes highly heated in the crucible assists in conveying heat to the charge in the shaft, thus extending the reduction zone and rendering it more effective through the increased volume of gas passing through.

"In this manner the percentage of CO_2 in the furnace gas can be kept higher than if no gas-circulation were used, and it is evident that this indicates a reduction in the fuel-consumption.

"The furnaces are placed in the central bay. On one side all the electrical gear is placed—transformers, switches, regulators, etc.—and this part is isolated from the metallurgical part. The power is derived from a hydro-electric plant nine miles and a half away, which power-station belongs to the company. The voltage of the line is 12,000 volts and is reduced to low pressure by transformer and adjusted by regulators to between 50 to 100 volts, as required.

"Each furnace has six electrodes, cylindrical in shape, and arranged to be used continuously without waste by using a screw-joint.

"The pouring-bay is fitted with electric overhead travellers, as well as trolly-tracks for transporting iron and slag. The iron can either be poured to pig or conveyed in ladles to the Bessemer and open-hearth furnaces. The slag is run into block moulds and makes excellent building-stone.

"The crushing-room is at the end of the furnace building. There are three crushers of the ordinary jaw type. There is a railway-track outside, and the daily requirements are supplied in the trucks, so that there is no need for large storing-bins. One of the crushers is fairly large, with wide enough jaw-space for the biggest lumps, and the ore passes from this crusher to the smaller ones, and thence by a bucket elevator to a belt-conveyor above the charging-platform, so that the raw material may be unloaded where required. There is a small ore-store, but this only contains some limited reserve amounts of the various kinds of ores used. The charcoal is transported from the stores by a ropeway.

"Three different kinds of pig-iron have been produced:—

(1.) Pig-iron for open-hearth treatment.

(2.) Pig-iron for Lancashire treatment.

(3.) Pig-iron for Bessemer treatment.

"The quality which is desired from the open-hearth pig is semi-spiegel and contains: Si, 0.40 to 0.60 per cent.; Mn, 0.30 to 0.50 per cent.; P, 0.011 to 0.018 per cent.; S, 0.015 per cent.

"It will be seen that it is more economical to produce spiegel iron in the electric furnace, and arrangements have been made to alter the open-hearth furnaces so as to use spiegel iron only.

"It has been assumed in various quarters that it would probably be difficult to maintain a constant product in an electric furnace. Experience has proved, on the contrary, that a much more constant product is obtained from the electric furnace than from the old blast-furnace. One reason for this is that there is such a large receiver or collecting-basin in the lower part of the electric furnace that it acts as a regulator on the quality.

"The Lancashire pig required is quite white and has the following analysis: Si, 0.20 to 0.30 per cent.; Mn, 0.20 to 0.30 per cent.; P, 0.011 to 0.018 per cent.; S, 0.015 to 0.020 per cent.

"During the early operation of the plant in question there was a tendency for the sulphur to be unduly high, but this was remedied by making the slag more basic whenever the furnace was run for Lancashire pig.

"The analysis of Bessemer pig used was as follows: Si, 1.00 to 1.40 per cent.; Mn, 2.50 to 3.00 per cent.; P, 0.015 to 0.019 per cent.; S, 0.005 per cent.

"Excellent Bessemer has repeatedly been made of this pig. The early attempts were not good, but it was soon found that Si and Mn had to be increased. It had been assumed that the amount would be normal, but apparently the lower temperature of the electro-Bessemer pig as compared with ordinary Bessemer pig from blast-furnaces necessitates a higher content.

"General experience points to the following results: It is cheaper to make spiegel than grey pig, because: (1) More current can be put through the furnace; (2) the current consumption is lower (per ton of product); (3) thus the production is higher; (4) the electrode consumption is lower; (5) the repair costs are lower.

"It may further be stated that rich charges give better (economic) results than poor ones. The quality of the pig however, is not influenced by the percentage of iron contents of the ore.

"For some time past the gas from the furnaces has been used as fuel in the open-hearth furnaces, and it is estimated that the value of the gas is from 2 to 3 shillings (50 to 75 cents) per ton of pig-iron produced.

"Finally, regarding the influence of the electric pig on the finished steel, experience has shown that the change tends to make better steel; this applies both to Bessemer and soft and hard open-hearth steels.

"The steel produced at Hagfors is of the highest quality and is mainly used for locomotive-boiler tubes, piano-wires, and high-tension wires generally.

"In Sweden, generally, the electric reduction of iron ore is regarded as revolutionizing this industry, and preparations are being made for constructing mills of considerable capacity. Recent experience has shown that large electrodes can be used at the same time as the current intensity on the electrodes is increased. Large furnaces will therefore be designed, and some of those now building have a capacity of 8,000 horse-power each.

"The general experience has been that the handling of the electric-reduction furnace is considerably simpler than an ordinary blast-furnace. More even quality is obtained without so careful watching. The quality can be changed easily, and the various grades from grey pig to spiegel can be obtained by simple manipulation. Less attention and less labour are required."

During the present investigation I have been in correspondence with Messrs. Electro-Metals, Limited, 56 Kingsway, London, W.C. 2, and reproduce the following extracts from two of their letters:—

Letter from J. O. Boving, June 28th, 1918.

"We have received your kind letter of the 5th inst., with regard to electric reduction of iron ore in Canada. It was exceedingly pleasant reading to the writer personally, who has for many years been in touch with various parties in Canada and could never understand why the electric reduction had not made any progress in a country where the conditions are so singularly suitable for the development of this industry. . . .

"Since you were in Sweden very great developments have taken place, and this has, of course, been especially accentuated by the war, when importation of coke has been difficult, and therefore the power existing in the country has been of greater value than ordinarily for electro-thermical operations.

"You will probably remember most of the plants you visited in Sweden, but we shall here recapitulate what has been done as far as we are acquainted up to now.

"There are two furnaces at Trollhattan—the original one and another of 3,000 kw. capacity.

"There are five at Hagfors—the two original ones and three later of 4,000 kw. capacity.

"There are three at Domnarfvet (the Helfenstein furnace was found quite useless and has been pulled out)—one of 7,000, one of 3,000, and one of 2,000 kw. capacity—and there are two more building of 3,000 kw. capacity.

"There is one at Soderfors of 5,000 kw.; one at Ljusne of 3,000 kw.; two at Porjus of 3,000 kw.; and three at Lulea of 3,000 kw.

"Some have been built in Norway, two in Switzerland, and two or three in Japan.

"The most important plant we have tackled is, however, the one in the Aosta valley, North-west corner of Alpine, Italy. Here we are erecting for the firm of Ansaldo & Co. (the largest armament firm of Italy) a reduction plant consisting of six units each of 3,000 kw. capacity. Two of these furnaces will be run on charcoal and four on coke. Half of the furnaces are built here and the half to our drawings in Italy.

"We are going to work out a revised estimate of the cost of this plant as applied to Canadian conditions and send along as soon as possible. This will give you a good idea of what you could look forward to. We shall also give you data regarding power-consumption, electrodes, labour, charcoal, and other supplies.

"Whilst we write you about reduction-furnaces, we think it is only right that we should inform you about the most remarkable developments which have been achieved with our steel-furnaces.

"The electric steel-furnace is undoubtedly the easiest apparatus existing to-day for melting steel and purifying it afterwards. The great flexibility of the electric heat and the possibility of applying it at the right point makes the removal of impurities, such as phosphorus and sulphur, and further complete deoxidation a very easy matter, and steel-makers in Europe are now unanimously of the opinion that as soon as the war is over electric furnaces will be installed by all large steel-mills, even for ordinary grades of steel. The process will be that whilst open-hearth furnaces and Bessemer converters will be maintained, these will only be used for taking the steel a certain part on the way towards perfection, and the final touch up will be made in the electric furnace. Treating molten steel in the electric furnace and refining it from impurities requires for a large unit between 80 and 100 kilowatt-hours per ton. This consumption is not prohibitive even under conditions such as are prevailing in this country, where power under ordinary conditions is available at a price of about one-third of a penny (0.7 cent). But it is a remarkable fact that even now during the war, when price for power ranges from 1 to 2 cents per unit, certain manufacturers, such as Brown-Bayley, Hadfield's, Cammell-Laird, and the Partington Steel Works, find it profitable to use our electric furnaces for treating ordinary carbon steel, starting from the cold. It should be, of course, remembered that this can only be done in fairly large furnaces having a capacity of at least 5 tons, because the current consumption increases very rapidly for small units. Thus, whereas a 1-ton furnace requires about

1,200 units for melting and refining 1 ton of scrap, a 5-ton furnace only requires about 750 units for the same work, and a 10-ton furnace round about 600 units.

"When we come to consider electric furnaces receiving their power from hydro-electric installations, the question comes into quite a different plane. In many cases it is possible to supply the current at the rate of 0.1 cent, and the price of the total current consumption is thus so reduced that the whole process compares very favourably with the most economical coal-gas-fired open-hearth furnaces.

"In connection with Messrs. Ansaldo's Reduction Works a large steel-works is also being installed. The rich gases from the reduction-furnaces are used in the steel-works, but there will also be a battery of ten 15-ton electric steel-furnaces, all energized by water-power. You may be interested to know that Ansaldo's metallurgical engineer is Professor and Dr. Giolitti (of carburizing-of-steel fame), and their steel-works are regarded as obtaining higher quality results than any other works.

"On the coast of Norway there are also a number of electric steel-furnaces energized by water-power, and these undertakings are paying extremely well, turning out fine steel and making huge profits."

Letter from J. Bibby, September 21st, 1918.

"The production costs given in our letter of August 19th (*see* Appendix X.) are for the manufacture of white pig-iron as you surmise, and these are to be obtained in the large plant at Messrs. Ansaldo's about which we wrote you. For the manufacture of grey foundry pig-iron in this large plant the consumption will be approximately 0.37 horse-power year per ton of pig-iron, assuming that the ore contains between 65 to 70 per cent. of iron.

"For a plant consisting of only one 4,000-horse-power furnace, for instance, the consumption would be from 5 to 10 per cent. higher, as the diversity factor would be greater. For the case you mention of 9,000 tons per year you could assume a consumption of 0.41 horse-power year per ton of grey iron produced from ore containing 65 per cent. of iron.

"With reference to the sintering mentioned on page 4 of your letter, it is quite a common practice in Sweden to employ as much as 50 per cent. sintered and 50 per cent. lump ore and obtain satisfactory results.

"With reference to the price of current in British Columbia, wo do not see why the cost there under similar circumstances should greatly exceed what is being done in Sweden, where current is being regularly supplied at the equivalent of $8 per horse-power year. The electric suppliers must take into account the favourable nature of an electric-furnace load as regards power factor and load factor. Under the circumstances you give of a 60-cycle supply running one furnace, the power factor would be as high as 0.92.

"With reference to charcoal, we are in a position to supply drawings and specifications for charcoal plants to suit any given requirements, and if desired we could quote you a fee for this work.

"We are pleased to learn that you are contemplating a new edition of your valuable book on electric furnaces, and we believe that you will consider a description of our recent developments worthy of notice. We are therefore preparing a description of the various improvements we have made since your book was published, and will send this on to you in due course. These improvements consist in the employment of a new 2-phase system for small furnaces up to 7 tons, and a new 4-phase system for furnaces between 7 and 30 tons capacity. We have also made improvements in the way of automatic regulators, electrode economizers, etc., all of which we will give you particulars. In the meantime we enclose you two electrical diagrams which no doubt will be quite clear to you.

"As regards the 6-phase arrangement, this is applied to our 3,000-kw. reduction-furnace. As before, we employ three transformers which each supply two diametrically opposite electrodes, but we so connect the transformers that we obtain six independent phases in which the relationships are definitely fixed."

In conclusion, I may say that the Electro-Metals furnace is undoubtedly the most efficient appliance that has so far been applied to the electric smelting of iron ores, but that in view of the large consumption of power by even this type of furnace it will be unwise to put up an elaborate plant of this kind unless an adequate and permanent supply of electric power can be obtained at a moderate price.

Unfortunately, some of the earlier reports gave exaggerated ideas of the economy of electrical power and charcoal that had been obtained with these furnaces, and I myself made the mistake of taking these reports literally when writing the 1914 edition of my book on "The Electric Furnace." After visiting Sweden and investigating the conditions obtaining there, I arrived at more conservative figures as put forward in my 1915 report. In Mr. Bibby's letter of September 21st, quoted above, he states that with a single furnace of 4,000 horse-power producing 9,000 tons per annum, the consumption would be "0.41 horse-power year per ton of grey iron from an ore containing 65 per cent. of iron." It will be obvious that from the available ores, which do not contain more than 55 per cent. of iron, the figure I am assuming of 0.45 horse-power year will not be too high.

Although the Swedish furnace is more economical than any other electric ore-smelting furnace, there still remains a considerable margin for further possible improvement, and I hope that some process of low-temperature reduction of iron ores may be worked out which will show a decided improvement over the Swedish process.

II. The Helfenstein Furnace.

The Helfenstein furnace was originally devised for the production of calcium carbide and ferro-silicon. (*See* R. Taussig, Faraday Society, V., 1910, page 254; Soc. Chem. Ind., XXXIX., 1910, page 435; Met. and Chem. Eng., X., 1912, page 686.) A 10,000-horse-power furnace of this type for iron-smelting was started at Domnarfvet in May, 1913, and was in experimental operation at the time of my visit in 1914. A more recent account appeared in *Iron and Coal Trades Review* (London), February 23rd, 1917, and in *Met. and Chem. Eng.*, May 1st, 1917, page 509, from which I have taken the following particulars:—

When charcoal was used, the consumption of power, etc., was 2,170 kilowatt-hours, 380 kg. charcoal (70 per cent. carbon), and 5 kg. of electrodes per metric ton of pig-iron. When coke was used, the consumption was 2,600 to 2,700 kilowatt-hours, 310 to 320 kg. of coke, and 4 kg. of electrodes. The consumption of 2,170 kilowatt-hours with charcoal corresponds to 0.392 horse-power year at 85 per cent. load factor. This is probably for the production of white iron from high-grade ores, though at the time of my visit ores of 50 per cent. iron were being smelted. It does not appear that the efficiency is any better than that of the Electro-Metals furnace, and it should be noticed that the use of coke causes the consumption of a far greater amount of electrical power.

The idea of this furnace is to increase the output and efficiency by using a far larger amount of power in a furnace of a given size than was possible in the Electro-Metals furnace. The furnace gases were not used to reduce the ore in the furnace, but were employed for other purposes in the plant. It is unfortunate that we have no detailed account of the operation of this furnace, or of the reasons which caused it to be abandoned.

III. The Noble Furnace.

At Heroult, in California, electric smelting of iron ores was undertaken in 1907, and was continued, experimentally, until about 1914. The first furnace was designed by Paul Heroult, and was a 2,000-horse-power rectangular furnace, with three vertical electrodes alternating with four vertical chutes for supplying the ore charge. The furnace had an arched roof and the chutes were heated by the escaping gases. The chutes became choked with the heated ore, the roof broke down or melted, the furnace could only be worked with an open top, and was finally given up. Professor D. A. Lyon experimented in 1908 with a single-phase furnace of 160 kw., and in 1909 put up a furnace of 1,500 kw., substantially like the earlier Swedish type of furnace. Work with this furnace was continued until 1911, when it was finally given up, possibly on account of difficulty in controlling the nature of the product. The Noble Company then reverted to the rectangular type of furnace, using four electrodes and five charging-chutes, which, however, were not heated. A 2,000-kw. furnace was built in 1911, and an additional furnace of 3,000 kw. in 1912 or 1913. The best account of this furnace was written by John Crawford, the plant manager, in *Met. and Chem. Eng.*, July, 1913, Vol. XI., page 383.

Mr. Crawford states that the tall-shaft furnace built in 1909 could probably have been made economically efficient, but that it could not be made to respond readily to changes in the burden, as would be essential for making consistently high-grade foundry iron. He explains the necessity in electric smelting of controlling accurately the addition of carbon in the charge, as an excess

of carbon cannot be burnt off as in the blast-furnace, and a deficiency results in low-grade iron. This difficulty of controlling the amount of carbon does not interfere with the production of a low-silicon iron—such as is used in Sweden—but in his experience it caused great difficulty in the production of foundry iron. In view of this the shaft-furnace was abandoned, and a 2,000-kw. 3-phase furnace of the long and narrow type was tried. This furnace had four electrodes, delta-connected and suspended between five charging-stacks. He considers that this type of furnace, which was operating in 1913, is the one best adapted to their needs. The second furnace of this kind, having 3,000 kw. capacity, consists of a rectangular steel shell 28 feet long and 10 feet wide, lined with standard firebrick. This is surmounted by five charging-stacks 18 feet high, and between the stacks the top of the furnace is arched over. The electrodes are of Acheson graphite, 12 inches in diameter, and enter vertically through the arch between each adjacent pair of charging-stacks. The furnace gases are not used for preheating or reducing the ore, but are led away and used under lime-kilns and charcoal-retorts. The electric current is supplied to the furnace at a voltage of from 40 to 80. He found that coke was less satisfactory than charcoal in this furnace, but that if the coke was crushed a mixture of 60 per cent. coke and 40 per cent. charcoal could be used with fair efficiency. The following is an analysis of a 200-ton lot shipped to a foundry for making steel castings:—

	Per Cent.
Silicon	2.88
Combined carbon	0.09
Graphite carbon	3.38
Sulphur	0.028
Phosphorus	0.031

Mr. Crawford does not consider this type of furnace as efficient as the shaft type, but states that he has kept the power-consumption as low as 2,200 kilowatt-hours per ton of pig in a furnace of 300 kw. This would equal 0.40 horse-power year at 85 per cent. load factor. He states, however, that the long and narrow type offers the possibility of building several furnace units on to each other, like copper blast-furnaces, and this would lessen the radiation and electrical losses and increase the efficiency. It would also enable part of the furnace to be repaired while the remainder was still in operation.

Since Mr. Crawford's article scarcely anything has been published about the Noble smelting-furnace, but I learn that the production of pig-iron was discontinued about the year 1914. This may not have been caused by any technical difficulty, because the commercial situation at Heroult, which can never have been very good, became impossible when the charge for power was raised from $12 to $25 per horse-power year. The plant is situated on the Pitt river, in Shasta County, and is reached by an independent line of rails from Pitt Station, on the Southern Pacific Railroad. The iron ore is about the only element of their supply which can be obtained cheaply at the works; there is not enough timber left near the plant for charcoal-making, and wood for this purpose has to be brought in by rail. All their general supplies and their products have to be shipped over two railroads from or to San Francisco or other industrial centre.

IV. The Open-pit Furnace.

For the production of calcium carbide and ferro-alloys a simple type of open-topped furnace has been developed, and this is recommended by Messrs. Beckman and Linden for the smelting of iron ores. The 3,000-kw. furnace erected by this firm at Bay Point for the production of ferro-manganese may be taken as typical. It consists of a rectangular steel box, about 17 feet long, 9 feet wide, and 7 feet high, suitably braced outside, and lined around the sides with 4½ inches of firebrick. The bottom lining is about 3 feet thick, composed of blocks of carbon, and the furnace is supported on piers to permit of air-cooling. The top of the furnace is open, and the three electrodes, which are of amorphous carbon, hexagonal in section, 24 inches in diameter and 7 feet long, are hung in the middle line of the furnace, being spaced 3 feet 6 inches apart from centre to centre. The lower ends of the electrodes are surrounded and covered by the ore and other materials when the furnace is operating. The upper ends of the electrodes are held by water-cooled metal-holders, which support the electrodes at the correct height and supply the electric current to them. The height of the electrodes is controlled and regulated by automatic machinery, which is designed to keep a constant electrical load on the furnace. Three-phase electrical power at 22,000 volts is supplied to three 1,000-kw. transformers, from which the working-current, at 70 to 100 volts, is led by flexible conductors to the three electrode-

holders. A charging-platform extends around the furnace about 3 feet below the top, and the mixture of ore, carbon, and flux is shovelled into the furnace from this platform. The molten ferro-manganese and slag are allowed to run out of the furnace periodically by means of a spout and tapping-hole opposite the centre electrode.

There can be no question that charcoal pig-iron of any desired grade can be made in this kind of furnace, which is easily and cheaply built and repaired, and should be able to run for a long time without need of repair. By providing an ample supply of power the efficiency should be satisfactory, and may be expected to approach fairly closely to that of the Swedish furnace. The charcoal-consumption will certainly be higher, but, as a poorer quality charcoal can be used, this need not cause any additional expense. The power-consumption will probably be higher; but it is impossible to speak positively on this point, because the loss in heat, due to the open top and the absence of a stack, may be largely balanced by the greater efficiency of a higher-powered furnace, and by the fact that stoppages for repairs will be fewer and less prolonged. The consumption of electrodes will probably be larger per ton of pig-iron, because they are somewhat exposed to the air, and perhaps also on account of the greater current density used in these electrodes. Although, in general, the furnace has much to recommend it as a simple and effective means for making iron, it must be remembered that the furnace gases are allowed to burn above the charge; thus not only are they wasted, but they create a serious nuisance. It is difficult to avoid the conclusion that, in operating such a furnace for the commercial production of pig-iron, the management would ultimately be obliged to close in the furnace-top, so as to remove the gases from the furnace-room, even if the value of the gases were neglected. The furnace, so closed in, would then resemble the Helfenstein or the Noble furnace, already described. If, then, it is decided to smelt in an electric furnace other than the Swedish type, it would be practicable to start with a simple pit furnace as used for ferro-manganese, and to add to this, if it seems desirable, provision for retaining the heat and gases and supplying the charge in a more mechanical manner.

If it is found practicable to reduce the crushed ore to a metallic powder in some gas-fired furnace, this powder can be melted down very simply and cheaply with additions of carbon and ferro-silicon to produce foundry pig-iron. A simple electric furnace provided with a cover will probably be the best for this purpose.

APPENDIX IX.

DESIGN AND COST OF PLANT FOR THE ELECTRIC SMELTING OF IRON ORES.

General Considerations.

(1.) We have seen that in view of the limited market it is undesirable at present to consider the production of more than 20 or 30 tons of pig-iron daily for use in foundries.

(2.) The cost of production on so small a scale would be very high, and, as there will not be a great profit in making pig-iron, it seems doubtful whether a plant of that size could pay its way under ordinary conditions.

(3.) If, however, we include in the plant furnaces for the production of steel and ferro-alloys, which can probably be made with a greater profit, and apart from this will help to carry the general overhead charges, there is more probability that the plant can be made to operate at a profit.

Electro-metals Plant.

Messrs. Electro-Metals, of London, are installing an iron-smelting plant for Messrs. Ansaldo & Co. in the Aosta valley in Italy, and I have received from them the following estimate of the cost of building a similar plant in Canada.

The plant would consist of six electric furnaces of the Swedish type, each using 3,000 kw. and producing 10,000 tons of pig-iron a year. This is for the production of a low silicon or white pig-iron from an ore of about 65 per cent. iron. The plant would consist of a large furnace building, divided lengthwise into three bays. One of these contains the transformers and other electrical apparatus, the central bay would contain the six electric furnaces, and the remaining bay would be devoted to the disposal of the pig-iron and the slag. Besides these, there would

be a storage-house for the charcoal, and stores for electrodes and other supplies, with bins or storage-space for the ores, fluxes, and pig-iron. No mention is made of unloading piers or wharves, or of railroad-tracks, or of the land on which the works would be erected, and it seems probable that further charges should be made for these.

The plant of 18,000 kw. is estimated to cost:—

Six shafts complete with charging-bells and pipes	$170,000
Twenty (1,000 kw.) transformers (two spares)	150,000
Switch-gear	40,000
Elevators	15,000
Pumps and water plant	40,000
Blowers, fans, and ducts	20,000
Motors	5,000
Buildings	100,000
Total	$540,000

This is equal to $9 per ton of yearly output.

For present consideration we may take a plant, producing pig-iron alone, of half this size; that is, of 9,000 kw. This would make more pig-iron than we need, but would be of about the right effective size and expense. Such a plant, with additional charges for the land, unloading-wharf, tracks, and rolling-stock, would cost in the order of $350,000 to $400,000. The estimated output for this would be 30,000 tons per annum, but this should be corrected (1) for the ore being of 53 per cent. iron instead of 65 per cent., which will probably reduce the output from 30,000 tons to 26,000; (2) a further correction, in view of the production of foundry instead of white iron, will reduce it to 24,400 tons, or 8,100 tons for each of the three furnaces.

It is probable, however, that the estimated output of 60,000 tons from a six-furnace plant was a conservative figure, and it appears reasonable to assume an average daily output per furnace of 25 tons of foundry iron, even from the low-grade ores of British Columbia. Twenty-five tons a day per furnace would be 9,000 tons per annum for each furnace, or 27,000 tons for the whole plant, and I shall base my calculations on this.

By way of comparison, I add an estimate, made for me in 1914, of the cost of building in Canada a 9,000-kw. plant of the Swedish type. The estimate was prepared by Mr. Assar Gronwall, of Ludvika, in Sweden. It is probable that the firm have introduced some economics since the date of this estimate, but the cost of construction, especially in British Columbia, has increased rapidly, and it seems likely that a complete plant, including land, wharf, and rolling-stock, will cost in the order of $400,000, or $15 per yearly ton of output.

Plant of Three Electric Furnaces of 3,000 Kw. each.

Excavation, levelling, railway-tracks, store-house for ore and coke or charcoal, foundations for buildings and furnaces	$ 30,000
Buildings—	
House of light iron construction for three furnaces	60,000
Crusher-plant house, laboratory, inclusive of appliances, workshop for repairs, and storehouse, and various smaller shops	12,000
Furnaces—	
Three furnaces at 4,000 horse-power, with fans and gas-pipes	75,000
Electric transformer instruments with low-tension conductors	100,000
Moulds, ladles, tools, and instruments	10,000
Travelling crane of 5 tons capacity	6,000
Ore-crusher, apparatus for transporting crushed ore to the furnace-top	7,000
Side-tracks for transport and other transporting devices	7,000
Water-pipes and waste-pipes	5,000
Drawings, supervision during construction, and unforeseen expenditures	48,000
Total	$300,000

If the Electro-Metals type of furnace is used there would probably be only two of these built, and the remaining power would be devoted to the production of ferro-alloys and to steel-making.

PLANT WITH OPEN-PIT FURNACES.

I visited in California a plant at Bay Point, San Francisco, and another at Heroult, in Shasta County, where ferro-manganese and other ferro-alloys are made in electric furnaces. The largest furnace used was a rectangular open-pit furnace, using 3,000 kw. and having three 24-inch carbon electrodes which are suspended in the furnace. Messrs. Beckman and Linden, who built and operated the plant at Bay Point, consider that furnaces of this type would give entire satisfaction for the production of pig-iron, and that such furnaces would have the added advantage that they could be employed at any time for the production of ferro-alloys. These furnaces would undoubtedly be cheaper to build and the repairs would be less costly, but, on the other hand, they would also certainly be less efficient than the Swedish furnaces. Messrs. Beckman and Linden prepared for me an estimate of the cost of a plant of this type, having one 3,000-kw. furnace for the production of pig-iron and other smaller furnaces for ferro-alloys. I have changed a few of their figures to provide for the construction of two 3,000-kw. furnaces.

7,000-kw. Plant for Pig-iron and Ferro-alloys.

Two 3,000-kw. 3-phase furnaces, installed, including casing, electrode-holders, jib-cranes, regulators, and foundations	$ 30,000
Seven 1,000-kw. single-phase, 33,000-volt primary, 60-cycle oil-insulated and water-cooled transformers, installed, with from 60 to 120 volts in 5-volt steps on the secondary side (one of these transformers is spare), at $6,500	45,500
Two sets low-tension busses for 3,000-kw. furnaces, installed	10,000
Two sets high-tension busses for 3,000-kw. furnaces, including oil-switches, switchboard, and meters	12,000
Three 300-kw. furnaces, single-phase, installed, including casing, electrode-holders, and regulating device	10,000
Four 300-kw. 33,000-volt primary, 60-cycle, single-phase, oil-insulated and water-cooled transformers, installed, with a range of from 70 to 100 volts in 5-volt steps on the secondary side	10,000
Three 50-kw. single-phase, 60-cycle, 33,000 volts to 440 volts, air-cooled transformers, installed, with switchboard (to be used for industrial purposes around plant)	2,000
One 25-kw. motor-generator set for regulators, etc., installed	2,000
Three sets low-tension busses for 300-kw. furnaces	1,500
One furnace building, built entirely of reinforced concrete, including electric travelling crane, tracks, metal-handling equipment, etc.	45,000
One transformer building, built entirely of reinforced concrete	13,000
One shipping-store building of wood and stucco exterior finish	7,000
One laboratory with complete equipment	7,500
One store-room and change-room building, built of wood and exterior stucco finish, including steel lockers, toilets, wash-basins, and shower-baths	8,000
One machine-shop with equipment	10,000
One office building	3,000
One gate-house with time-clock and time-keeper's office	500
Railroad-tracks, industrial track, ore-handling equipment, water-supply, sewerage, fence, and industrial lighting, etc.	25,000
Land, 4 acres	4,000
	$246,000
Engineering and contingencies, 20 per cent.	49,200
Total of Beckman and Linden's estimate	$295,200

Brought forward	$295,200
Additional items—	
Dock with unloading locomotive, crane, etc.	30,000
Charcoal storage	8,000
3- to 10-ton ladles for handling metal	6,000
Flues and stack	25,000
Total	$364,200

Say a total of $350,000.

In the above list I have added to Messrs. Beckman and Linden's estimate a few items that should apparently be included. A dock and unloading plant would be needed for economical operation on a large scale, a storehouse would be needed for the charcoal, and it will probably be desirable to use large ladles for handling the molten metal. In the plant at Bay Point the furnace gases escape and burn in the furnace-room, creating a very serious nuisance. I would advise the construction of suitable flues and stack for the removal of furnace gases and the collection of the dust blown out by the furnaces. These flues can be placed below the charging-platform.

The above estimate represents the cost of a complete plant having one furnace making foundry iron for sale, a second making white iron for steel-making, and three smaller furnaces for ferro-alloys. As, however, we are considering in the first place the cost of production of pig-iron alone, I have rearranged the estimate for this purpose, so as to represent a plant of 9,000 kw. making foundry iron in three 3,000-kw. furnaces. This estimate should then be comparable with the Swedish estimates for a 9,000-kw. plant.

Beckman and Linden's Estimate modified for a 9,000-kw. Plant making Pig-iron.

(For details *see* previous estimate.)

Three 3,000-kw. furnaces	$ 45,000
Eleven 1,000-kw. transformers (two spares)	71,000
Three sets low-tension busses	15,000
Three sets high-tension busses	18,000
Three 100-kw. transformers, etc.	3,000
One 25-kw. motor-generator, etc.	2,000
One furnace building, etc.	35,000
One transformer building	15,000
One shipping-store	7,000
One laboratory	7,500
One store-room	8,000
One machine-shop	10,000
One office building	3,000
One gate-house	500
Railroad-tracks, etc.	25,000
Land	5,000
	$270,000
Engineering, etc., 20 per cent.	54,000
Total from Beckman and Linden's figures	$324,000
Additional items—	
Dock, etc.	30,000
Charcoal storage	8,000
3- to 10-ton ladles	6,000
Flues and stack	25,000
Total	$393,000

The corresponding figures, derived from the Swedish estimate, were between $350,000 and $400,000, but this does not mean that the Swedish furnace is the cheaper, as the estimates differ in completeness and are based on different conditions. We may, however, conclude that a com-

plete plant using 9,000 kw. for the production of pig-iron would cost about $400,000. It would appear certain that with an equal completeness of construction the Swedish plant would be somewhat more costly than the other, and for further calculation we may assume the cost of a Californian plant of 9,000 kw. to be $400,000, and of an equally complete Swedish plant $450,000.

In order to obtain an independent judgment in regard to the general arrangement and cost of an electric-smelting plant in British Columbia, I discussed the design with Mr. R. H. Stewart, of Vancouver, and he contributed some general considerations in regard to the design and cost data for the general portions of the plant, exclusive of the electrical furnaces and appliances.

The design was for a plant of 20,000 horse-power (15,000 kw.) for the production of 100 tons of iron daily and 20 tons of ferro-alloys. The plant was designed to handle daily the following quantities:—

	Tons.
Iron ore	200
Charcoal	50
Limestone	20
Electrodes	2
Manganese ore	20
Quartz	10
Chrome ore	10
Scrap-steel	20

Although the plant as a whole was based on a daily capacity of 100 tons of iron and 20 tons of ferro-alloys, the electrical and furnace equipment is only about half of this, corresponding to a consumption of 10,000 horse-power or 7,500 kw., and a production of 50 tons of pig-iron and 5 tons of ferro-alloys: provision being made for extension at a later date.

The furnace building would be 50 feet wide, 30 feet high, and 150 feet long. It would contain along one long side two 3,000-kw. open furnaces for smelting iron ore and three 300-kw. open furnaces for ferro-alloys. On the other side of this wall would be the transformer building, 30 feet wide and 30 feet high. The supplies of ore for the furnaces would be delivered by an elevated track in front of the furnaces and level with the charging-platforms. The furnace gases would be removed by flues below the charging-platforms. The pig-iron could be tapped into large ladles and cast in sand or in a casting-machine or poured direct into a Bessemer converter for steel-making. The ores and other supplies coming by water would be unloaded into storage by a locomotive crane. The charcoal would need a large storage-shed, perhaps 300 feet long and 90 feet wide, which would contain a month's supply, stored not more than 10 feet deep.

The order of operations would be as follows:—

(1.) Unloading from the dock directly into storage.

(2.) Removal from storage, using the same crane, to crushing and sampling plant.

(3.) Removal from crushing plant to the furnace charge-bins.

(4.) Delivering from charge-bins over weighing-hoppers to the charge-cars and thence to the side of the furnace.

(5.) Smelting for pig-iron or ferro-alloy.

(6.) Molten pig-iron received in ladle and handled by crane to casting-bed or casting-machine or to steel-making furnace.

(7.) The slag would be received in a ladle and removed by a locomotive.

The following is based on Mr. Stewart's estimate for the cost of buildings and general plant. Items for the furnaces and electrical equipment have been added from Messrs. Beckman and Linden's estimate:—

20,000-h.p. Plant with 7,000 Kw. of Electric Furnaces and Equipment.

Mr. Stewart's items—	
Locomotive crane, buckets, and grab-buckets	$ 19,000
Dock, say	10,000
Electric locomotive, cars, and equipment for handling between the wharf and the crushing plant	10,000
Crushing and sampling, say	17,000
Charcoal storage for one month's supply	8,000
Carried forward	$ 64,000

Brought forward	$ 64,000
Tracks, etc., for the above-mentioned equipment	3,500
Lifting-magnet for steel scrap, etc.	1,200
Storage of manganese ore	3,500
Storehouse for electrodes and other supplies, including a small crane	6,000
Six furnace charging-bins, including weighing-hoppers and mechanical feeders	9,000
Tracks, charge-cars, and locomotive, with supports for the overhead track	10,000
Furnace building, including crane runway	25,000
Transformer building	12,000
3- to 10-ton ladles	6,000
Flues and stacks	25,000
20-ton crane, 50-foot span	18,000
Laboratory and equipment	6,000
Office	5,000
Machine-shop and blacksmith's shop	12,000
Wash-house and change-room	3,000
Slag-handling equipment	8,000
Items from Messrs. Beckman and Linden—	
Two 3,000-kw. 3-phase furnaces, installed	30,000
Seven 1,000-kw. single-phase transformers	45,500
Two sets low-tension busses for 3,000-kw. furnaces	10,000
Two sets high-tension busses, etc., for 3,000-kw. furnaces	12,000
Three 300-kw. single-phase furnaces, installed	10,000
Four 300-kw. transformers, installed	10,000
Three 50-kw. single-phase transformers	2,000
One 25-kw. motor-generator set for regulators	2,000
Three sets low-tension busses for 300-kw. furnaces	1,500
Land, say	6,000
Engineering and contingencies, 20 per cent. on $129,000	25,800
Total	$372,000

Modifying this estimate to represent a plant of 9,000 kw. making pig-iron only, we have:—

9,000-kw. Plant for Pig-iron.

Mr. Stewart's items	$217,000
Three 3,000-kw. furnaces	45,000
Eleven 1,000-kw. transformers	71,000
Three sets low-tension busses	15,000
Three sets high-tension busses, etc.	18,000
Three 100-kw. transformers	3,000
One 25-kw. motor-generators	2,000
Land	6,000
Engineering, etc., 20 per cent. on $160,000	32,000
Total	$409,000

These figures agree with the previous estimate of $400,000.

Design and Cost of Complete Plant.

The foregoing estimates of the cost of a 9,000-kw. plant for making pig-iron are for use in calculating the cost of smelting pig-iron. Any plant actually constructed would be more complex in nature, as it would include furnaces for ferro-alloys and for steel-making.

Such a plant, as has already been indicated, might suitably contain:—

Two 3,000-kw. furnaces making pig-iron.

Three 300-kw. furnaces making ferro-alloys.

This plant will produce daily about 25 tons of foundry pig-iron and about 30 tons of white pig-iron for steel-making, together with about 3 tons of ferro-alloys. The plant would cost in the order of $370,000.

To make the plant complete and self-contained, there should be added electric or other furnaces for making steel, and a steel-foundry and rolling-mill for handling the steel so produced.

I have obtained from Mr. W. G. Dauncey approximate figures for the cost of a steel-foundry and rolling-mill. This plant would handle in all about 50 tons of steel per day.

Cost of Steel Plant.

Main foundry building, including drying-ovens, core-ovens, pits, moulds, and a 25-ton overhead crane and runway	$ 60,000
Lean-to building for furnace-house	12,700
Three 6-ton (rated) electric furnaces	75,000
Transformers and electrical equipment for three furnaces	54,000
One 9-inch rolling-mill, including building, one continuous heating-furnace, and three reheating-furnaces	125,000
Total	$326,700

Only two of the electric furnaces would be in operation at any one time, and they would use between them about 3,000 kw., which would bring the total consumption in the whole plant up to about 10,000 kw.

As an alternative to the above, Mr. Dauncey recommends a steel-foundry equipped with two oil-burning open-hearth furnaces, specified as follows:—

Two 15-ton open-hearth oil-fired furnaces; three 15-ton ladles; one overhead 25-ton travelling crane; twenty charging-trucks and boxes; storage oil-tanks and all necessary small equipment for handling 90 tons of steel per twenty-four hours	$145,000
Necessary buildings for the above	35,000
Total	$180,000

This second estimate is for steel-foundry only, without any rolling-mill, but, on the other hand, it has a capacity of 90 tons of steel in place of some 50 tons provided for in the first estimate.

Collecting the figures together, we find for the complete plant:—

7,000-kw. electric-smelting plant for making pig-iron and ferro-alloys	$375,000
3,000-kw. electric steel-foundry and rolling-mills	325,000
Complete iron and steel plant	$700,000

The final daily product of this plant, after allowing for the use of pig-iron and ferro-alloys in the plant itself, would be about:—

	Tons.
Foundry pig-iron	25
Ferro-silicon, ferro-manganese, and ferro-chrome	2
Steel castings and rolled steel	50

APPENDIX X.

THE COST OF MAKING PIG-IRON.

Although the output of foundry iron for sale will be only 25 tons a day, a further 25 or 30 tons of pig-iron will be made for conversion into steel, and additional power will be used for steel-making and the production of ferro-alloys. Instead, therefore, of calculating the cost of producing iron in a plant of 25 tons daily output, using some 3,000-kw., we may fairly figure on a plant of three times this capacity, or 9,000 kw., with a production of 75 tons of foundry iron daily.

The main items of cost in the production of foundry iron are:—

Iron ore of about 55 per cent. costing $4 per net ton.

Charcoal costing $6 to $8 per net ton.

Electric power, labour, and management.

It was understood that electric power could probably be obtained for about $15 per horse-power year, and the following calculations were made on that assumption. It now appears that a charge of 0.5 cent per kilowatt-hour would be made for electric power, and a calculation on this basis is given towards the end of this Appendix.

The cost of labour is discussed in Appendix VII. and in the following pages; it appears to vary from about $4 to $8 per ton of pig-iron, according to the size and nature of the plant, and with the probable variations in wages.

The following discussion is based on the production of foundry pig-iron by the usual electric-smelting methods in furnaces of the Swedish or of the open-pit type in a plant having a total production of 70 or 80 tons daily. The cost of making electric-furnace iron by a method involving the preliminary reduction or metallizing of the crushed ore is discussed in Appendix XII.

COST WITH THE SWEDISH FURNACES.

I have received from Messrs. Electro-Metals, of Sweden, the following estimate of the cost of a ton of pig-iron made in a six-furnace plant of 60,000 tons per year. I quote this unaltered, for interest, as showing the cost at which electric-furnace iron can be made under exceptionally favourable conditions:—

1.5 tons of ore at $1	$ 1 50
0.5 ton of lime at $1	50
0.33 ton of charcoal at $6	2 00
10 lb. of electrodes at 5 cents	50
Electric current at $8 per horse-power year	2 50
Repairs and maintenance	50
Labour	2 00
Management	1 00
Interest and depreciation	1 00
Total cost per ton of pig	$11 50

In this estimate the word "ton" probably denotes in each case the metric ton of 2,204 lb., which is nearly the same as the gross ton of 2,240 lb.

The corresponding figures in British Columbia, in view of the higher costs of ore, power, supplies, and labour, the smaller scale of the plant, the lower grade of the ore, and the production of foundry iron instead of white iron, would be about as follows for 1 gross ton of iron in a plant of three 3,000-kw. furnaces making 27,000 tons of iron per annum:—

2 net tons of ore at $4	$ 8 00
0.4 net ton of charcoal at $8	3 20
15 lb. of electrodes at 8 cents	1 20
0.45 horse-power year at $15	6 75
Repairs and maintenance	1 00
Labour	4 50
Management	2 00
Interest 6 per cent. and depreciation 10 per cent.	2 60
Royalty to Electro-Metals	50
Total	$29 75

It appears that by this system foundry iron can be made at a cost of about $30 per ton.

In regard to these figures it will be noted:—

(1.) That the charge for ore ($8) is high, partly because of the high cost per ton of the ore; this cost could probably be reduced to about $3 per ton of ore if the iron-mining industry should in the future develop on a larger scale. The charge is high, also, because the ore is low grade, containing about 55 per cent. of iron, so that 2 tons of ore are needed to yield 1 ton of pig-iron. If it were possible to obtain a 65-per-cent. ore at $3 per ton, the item of $8 for ore would be reduced to $5.

(2.) I have assumed elsewhere that charcoal could be made from mill-waste at from $6 to $8 per ton. For the open furnace I take the lower figure of $6, but for the Swedish furnace, which requires a better grade of charcoal, I am taking the higher figure. I see no prospect of a material reduction in this item. The amount charged (0.4 ton) is higher than in the previous table, partly on account of the production of foundry iron instead of white iron, and partly because charcoal is weighed by the short ton and pig-iron by the long ton, while the original estimates are doubtless based in each case on the metric ton.

(3.) The electrode-consumption has been increased in view of the production of foundry iron, and the price is that at which electrodes can be imported from Eastern makers. It is possible that by making electrodes locally the cost could be reduced to 4 cents a pound, thus reducing the item from $1.20 to 60 cents per ton of pig-iron.

(4.) The charge of $2.50 for power, estimated by the Electro-Metals Company, corresponds with a consumption of 0.31 horse-power year per ton of iron. This figure must be raised by about 0.05 on account of the lower grade of ore, and a further 0.05 on account of the production of foundry iron, thus making 0.41; 0.45 appears to be as low a figure as it is safe to assume under these conditions.* If in the future power could be obtained at $10 per horse-power year, the item of $6.75 would be reduced to $4.50, effecting a saving of $2.25 per ton.

(5.) The items for labour, management, and maintenance have all been increased from the Electro-Metals estimate in view of the high cost of labour and salaries at the present time. It does not seem likely that any material reduction in these items can be expected during the next five or ten years.

(6.) Interest at 6 per cent. was calculated on the cost of the plant, $400,000, and a working capital of $100,000; and depreciation was calculated at 10 per cent. on the cost of the plant. The output was taken at 27,000 tons per annum. Royalty to the Electro-Metals has been assumed at 50 cents per ton, but I have no grounds for this figure.

(7.) If the economies indicated in (1), (3), and (4) could all be carried out, the cost of making pig-iron would be reduced to about $24 per ton. In view of this, it would appear that a plant making pig-iron in the Swedish furnace with $10 power should be able to continue to operate at a profit even when prices fall considerably below their present level.

The following details of the cost of making electric-furnace iron (probably white pig-iron) at Gellivare, in North Sweden, are contained in a report by J. A. Leffler, which appeared in the *Iron Age*, September 13th, 1917, page 605. I have changed the items from English to Canadian money.

Cost of One (Metric) Ton of (White) Pig-iron.

1.6 (metric) ton of ore (50 per cent. ore and 50 per cent. briquettes) at $2.74	$ 4 38
Limestone	16
0.4 ton of charcoal at $12.50	5 00
0.272 kilowatt-year (0.365 horse-power year at $9.50)	3 46
Electrodes	44
Repair and upkeep	88
Wages	1 56
Management and sundries	54
Royalty	34
Sinking fund	86
Rents	1 38
Carriage to Lulea	1 16
Total	$20 16

Comparing my estimate for present conditions in British Columbia, it will be seen:—

(1.) That we have to face an increase of $3.62 on the cost of ore.

(2.) The consumption of charcoal is taken as the same amount, but we should obtain charcoal more cheaply, thus saving $1.80.

(3.) My power assumption is 0.085 horse-power year more than the above. This is justified by the lower grade of ore used and the higher grade of iron to be made. This difference, together

* A discussion of the power-consumption will be found in Appendix VIII.

with the increased cost per year ($15 instead of $9.50), produces an increase of $3.29 in the charge for power.

(4.) Electrodes cost 76 cents more on account of the greater consumption and the higher price.

(5.) Repairs and maintenance are only 12 cents more.

(6.) Royalty is assumed at 16 cents more.

(7.) Interest and depreciation in my estimate come to 36 cents more than the charges for sinking fund and "rents" in the Swedish estimate.

(8.) Labour and management come to $6.50 in my estimate, but only $2.10 in Sweden. This difference of $4.40 is due partly to the smaller scale of the proposed plant, but mainly to the very much higher scale of wages and salaries now obtaining in British Columbia.

It will be seen that the increased amount of my estimate (about $10 more than the Swedish cost) is due, in about equal proportions, to the increased charges for ore, power, and labour.

MAGNETIC CONCENTRATION OF THE ORE.

It may be worth while to attempt an estimate of the results of concentrating the ore before smelting it, so as to find whether any economy may be expected to result from this operation.

Assume the ore is a magnetite containing 50 per cent. of iron and costing $3 a ton at the concentrating plant, with a further charge of $1 per ton freight to the smelter. The cost, using the undressed ore, is $8.80 per ton of pig-iron, as 2.2 net tons of ore would be needed. The ore is crushed to a coarse powder at a cost of 50 cents a ton. One ton of the crushed ore will probably yield 0.6 ton of 70-per-cent. concentrate and 0.4 ton of 20-per-cent. tailings. The concentrate is sintered with cheap fuel on the Dwight-Lloyd machine and the briquettes shipped to the smelter. The cost of dressing and sintering will be about $1 per ton of the concentrate. The cost of the product per ton of pig-iron will be:—

2.4 tons of ore mined at $3	$ 7 20
2.4 tons of ore crushed at 50 cents	1 20
1.4 tons of concentrates, dressing and sintering at $1	1 40
1.4 tons of concentrates, freight at $1	1 40
	$11 20
2.2 tons of 50-per-cent. ore at $4	8 80
Increased cost due to process	$ 2 40

On the other side we may expect the following economies:—

2½ lb. of electrodes at 8 cents	$ 20
0.08 horse-power year at $15	1 20
Repairs and maintenance	15
Labour	65
Management	30
Interest and depreciation	40
Total	$ 2 90

It does not appear, therefore, that a great saving could be effected by dressing a 50-per-cent. ore if crushing and sintering were necessary, though Messrs. Beckman and Linden consider that a net saving of nearly $3 per ton could be effected in this way. I may add that for this calculation I have assumed that the operation of sintering would remove the sulphur so completely that it would not be necessary to form a slag for its removal, and also that a white iron would be made and turned to foundry iron by the addition of ferro-silicon, so that it would not be essential to have any silica in the furnace charge. An alternative plan would be to use about two-thirds of sintered concentrates and one-third of undressed ore in the furnace charge, thus obtaining enough silica for the production of foundry iron.

Although the above calculation shows only a small saving by the concentration of a 50-per-cent. iron ore, it is possible that a more important economy could be effected by magnetic concentration in the manner indicated in Appendix III.

PRODUCTION OF FOUNDRY IRON.

On account of the fact that the Swedish furnace is generally used for the production of a white pig-iron containing not more than about 1 per cent. of silicon, we have no exact data for the production of foundry iron of, say, 3 per cent. of silicon in this furnace. We are satisfied, however, that there would be a decided increase on this account in the cost for power, charcoal, electrodes, and maintenance, besides the general overhead, labour, and interest charges. In view of this, it is worth while to consider what the cost would be of converting white iron into foundry iron by the addition of ferro-silicon. One ton of iron containing 1 per cent. of silicon would need the addition of 0.04 ton of 50-per-cent. ferro-silicon to raise its silicon content to 3 per cent. This ferro-silicon would cost, made in the plant, about $85 per ton, or $3.50 for the amount needed.

If the pig-iron were received in a large ladle and the ferro were thrown in red-hot, there should be enough heat to effect a perfect mixture; and as the iron is cast into pigs for sale, and then remelted in a cupola, any irregularity would be remedied before the final casting. The saving in the cost of smelting through producing white iron instead of foundry iron would about equal the cost of the ferro-silicon, and there would be the added advantage of making a single furnace product and turning as much of this as was needed into foundry iron.

Mr. Gronwall, in his estimate made in 1914, places the difference in cost between grey and white pig-iron as:—

0.03 ton of charcoal.
0.03 horse-power year.
5 lb. of electrodes.
10 cents for repairs.
7 cents for petty charges.

Under our conditions this would mean:—

Charcoal at $8	$0 24
Power at $15	45
Electrodes at 8 cents	40
Repairs and petty charges	21
Total	$1 30

We must add, however, a proportion of the charges for labour, management, and fixed charges amounting to about 60 cents, thus bringing the whole up to $1.90. The additional expense may easily be as much as 0.05 ton of charcoal and 0.05 horse-power year, and the increased cost would then be about $3 a ton (everything considered), or nearly as much as the cost of the ferro-silicon addition.

The ferro-silicon used was found to cost $3.50, but, as it replaces an equal weight of pig-iron costing $1, the net cost of the addition will only be $2.50 per ton of the resulting foundry iron.

The foregoing discussion is not intended to prove that the addition of ferro-silicon to white iron is the best way of making foundry iron, but merely that the use of the Swedish furnace for foundry iron would be perfectly safe, because ferro-silicon could be added without much additional expense if it were found impracticable to make foundry iron directly.

COST OF SMELTING IN SIMPLE PIT FURNACE.

The following is an estimate of the cost of making a ton of foundry iron in a 3,000-kw. furnace of the simple pit type. This estimate has been prepared by Messrs. Beckman and Linden, depending on their commercial experience of the production of ferro-manganese in such a furnace. As, however, they have no data with regard to the production of pig-iron, they have accepted my figures for the probable consumption of power and charcoal in such a furnace. These assumptions, which are based on calculation, are that the open furnace would need 0.50 horse-power year of electric power, which is 0.05 more than I allowed for the Swedish furnace, and 0.50 ton of charcoal, which is 0.1 ton more than I allowed for the Swedish furnace.

Messrs. Beckman and Linden argued, from general considerations, that the open furnace would be at least as economical of power as the Swedish furnace, but were not prepared to guarantee such a performance. I do not think it will be safe to assume any better figures than those I have given until the performance of this furnace has been demonstrated in commercial

operation over a considerable period. The figures they give for labour, general expenses, and interest are probably too high, because they are considering a single 3,000-kw. furnace, while the plant we have in view will employ about 10,000 kw. The output of the single furnace is taken as 8,000 tons per annum.

*Beckman and Linden's Estimate of the Cost of One Long Ton of Foundry Pig-iron made in Open Furnace from a 50-per-cent. Ore.**

Iron ore, 2 tons at $4 per ton	$ 8 00
Electrical power, 0.5 horse-power year at $15	7 50
Charcoal, 0.5 ton at $6 per ton	3 00
Electrodes, 20 lb. at 10 cents per pound	2 00
Labour	8 00
Supplies	1 00
Plant and general office expenses	5 00
Interest and depreciation, 20 per cent. on $180,000	4 50
Total	$39 00

If we are considering this furnace as a unit in a plant of 10,000 kw., it seems probable that the cost of labour would be about $6, the general expenses $3, and the interest and depreciation $3. With these changes the total cost would be reduced to $33.50, or about $4 more than my estimate with the Swedish furnace.

Messrs. Beckman and Linden consider that using 50-per-cent. ore at $4 they could obtain a 65-per-cent. concentrate at $6.45 per ton, including the cost for concentrating and sintering of $1.25 per ton of concentrate. Using this concentrate, they estimate the following, assuming an output of 10,000 tons per annum from a 3,000-kw. furnace:—

Beckman and Linden's Estimate of the Cost of Foundry Iron from 65-per-cent. Concentrate.

Iron ore, 1.54 tons at $6.45 per ton	$ 9 93
Electric power, 0.4 horse-power year at $15	6 00
Charcoal, 0.5 ton at $6	3 00
Electrodes, 20 lb. at 10 cents per pound	2 00
Labour	6 40
Supplies	1 00
Plant and general office expenses	5 00
Interest and depreciation, 20 per cent. on $140,500	2 81
Total	$36 14

This estimate shows a saving of $3 as compared with the cost of smelting the undressed ore, but I am doubtful whether so small a degree of concentration would do more than barely pay for itself. Thus, even assuming the small cost of $1.25 per ton of concentrate to cover the crushing of the ore, the magnetic dressing, and the sintering of the concentrate, it appears that Messrs. Beckman and Linden have figured on a perfect dressing, losing no iron in the tailings. If we assume the latter to contain even so little as 15 per cent. of iron, we would need 1.43 tons of ore for each ton of concentrate, which with the above charge would work out at $6.97 per ton, or $10.30 per ton of iron. The difference in power-consumption of 0.10 horse-power year per ton was deduced from my own figures, but is probably rather too high; 0.075 would be a more probable estimate. A mistake appears to have been made in the item for interest and depreciation, which can hardly be reduced from $4.50 to $2.81 by the increased richness of the ore. I believe it would be found in practice that the enrichment of the ore from 50 to 65 per cent. would not effect any considerable saving. On the other hand, as I show elsewhere, if an ore of, say, 40-per-cent. could be mined decidedly more cheaply per unit of iron contents than a 50-per-cent. ore, a concentrate of 65 per cent. or upwards could probably be made from this cheaper ore at such a price as to offer a material saving. It should be added that the whole of the foregoing discussion depends upon the ease and completeness with which the ores of British Columbia can be concentrated. At present we have no information on this subject.

* It will be found that, making reasonable allowance for losses, the ore would have to contain about 55 per cent. of iron in order that 2 net tons of it should yield 1 long ton of pig-iron.

An examination of the above estimate will show that the consumption of iron ore must be taken as 2 *long* tons of 50-per-cent. ore and 1.54 *long* tons of 65-per-cent. concentrate respectively per long ton of pig-iron produced. They differ in this respect from my own estimates, which are in *short* tons of ore per *long* ton of pig-iron. My estimates were made in that way because the cost of ore, charcoal, etc., in British Columbia is quoted on the short ton, while pig-iron is always sold by the long ton.

For the purpose of this report, I furnished Messrs. Beckman and Linden with the following estimate of the commercial consumption of power and charcoal per long ton of foundry pig-iron made in an open-pit furnace. This estimate may be regarded as too conservative, but I have no data on which I could base a closer estimate.

	H.P. Year.	Net Ton Charcoal.
White charcoal iron from 65-per-cent. concentrate	0.35	0.45
White charcoal iron from 50-per-cent. iron ore	0.45	0.45
Grey charcoal iron from 65-per-cent. concentrate	0.40	0.50
Grey charcoal iron from 50-per-cent. iron ore	0.50	0.50

I have no reason for doubting the general correctness of these figures, which, of course, will vary with the size of furnace and operating conditions, but for purposes of comparison I would alter the power-consumption assigned to items 2 and 3 so as to make them equal. Thus the power-consumption for white charcoal iron from 50-per-cent. ore and for grey charcoal iron from 65-per-cent. concentrate would each be 0.42 or 0.43 horse-power year.

Comparison with Blast-furnace Methods.

It may be of value to compare with my estimate of the cost of making pig-iron in the Swedish furnace the following estimates by the B. L. Thane Company of the cost of making pig-iron in a large blast-furnace near Puget sound at 1918 prices:—

B. L. Thane Company's Estimate of the Cost per Long Ton of Blast-furnace Pig-iron.

Iron ore, 3,457 lb. at $4.40 per long ton	$ 6 81
Coke, 2,485 lb. at $9.60 per net ton	11 93
Limestone, 1,000 lb. at $1.90 per long ton	81
Labour	1 50
Materials	1 50
Capital charges	3 40
Total	$25 95

(1.) The charge for iron ore, $6.81, is less than my estimate of $8, merely because the ore is assumed to contain 65 per cent. of iron, whereas I have been advised that it will not be safe to assume more than 55 per cent.; the price per ton of ore being the same ($4.40 per long ton instead of $4 per short ton).

(2.) The charge for coke, $11.93, is more than the combined charges for charcoal, electrodes, and power, $11.15.

(3.) The capital charges are nearly the same, $3.40 and $2.50, or including the royalty, $3.10.

(4.) The electric-furnace estimate is higher than the other on account of the heavy charges for labour, $4.50, and management $2, compared with the single item of $1.50 for labour in the blast-furnace plant. This difference is caused mainly by the difference in the scale of operations; a coke blast-furnace turning out at least 300 tons of iron daily, while the electric furnace would scarcely make 30 tons.

In conclusion, there does not appear to be any cause, other than the different size of the furnaces, why electric-furnace iron should cost more than blast-furnace iron under the conditions we find on the Coast, and providing that power can be obtained at $15 or less.

Two other estimates by the B. L. Thane Company place the consumption of coke at 2,240 lb., costing $7.13 per net ton of coke or $7.98 per ton of iron, and at 2,625 lb., costing $12.20 per net ton of coke or $16 per ton of iron; the total cost of a ton of pig-iron coming to $22 and $30.02 respectively.

Since the above was written I have received a letter from the British Columbia Electric Railway Company, which is reproduced in Appendix IV., stating in effect that they would supply large blocks of power up to 10,000 horse-power in the neighbourhood of Vancouver for a charge

of 0.5 cent per kilowatt-hour. This charge is so high as to render impossible any large-scale production of electric pig-iron in the Swedish or open-pit furnace, and unless some other method can be devised that will need decidedly less power, all that can be done will be to make a small amount of pig-iron during the present period of extreme high prices. In view of the necessarily temporary nature of such operation, it would be impossible to install a plant of Swedish furnaces, and we can only consider the simple open-pit furnace, because, although it uses more power per ton of pig-iron, it can be installed more quickly and more cheaply, and can easily be converted to the production of ferro-alloys, or even replaced by electric steel-making furnaces, when the drop in the price of pig-iron shall render its production impossible.

In calculating the cost of making iron in the simple pit furnace with power at 0.5 cent, I must, for comparison with the previous instances, convert this figure into a charge for the horse-power year. For this purpose I shall assume a load factor of 85 per cent., which provides for stops for repairs, as well as the usual degree of irregularity of power. On this assumption the horse-power year would cost $27.80. The cost of making a long ton of foundry iron in a plant of 10,000 kw. would be about as follows:—

Cost of One Long Ton of Foundry Iron using 0.5-cent Power.

Iron ore, 2 tons at $4 per ton	$ 8 00
Electrical power, 0.5 horse-power year at $27.80	13 90
Charcoal, 0.5 ton at $6 per ton	3 00
Electrodes, 20 lb. at 10 cents per pound	2 00
Labour	6 00
Supplies	1 00
Plant and general office expenses	5 00
Interest and depreciation	3 00
Total	$41 90

With so high a charge for power the operations would probably be on a smaller scale, and it would be inexpedient to install as much labour-saving appliances, so that the cost would agree more closely with Beckman and Linden's estimate of $39, corrected for the higher price of power. This would come to $45.40 per ton of pig-iron. Thus it appears that unless cheaper power can be obtained the cost of making electric pig-iron in British Columbia will be in the order of $40 to $45 per ton.

The British Columbia Railway Company offer 2,000 kw. of $15 power on Vancouver island, but this does not improve the situation materially, because the scale of operations would be so small that the cost of a ton of iron would certainly be in excess of $40.

It should also be noted that the above offers of power carry some restrictions with regard to the company's peak-load periods. I have no particulars in regard to this, but no doubt it would further increase the operating cost by reducing the output from a given electrical plant and staff.

APPENDIX XI.

REPORT BY MESSRS. BECKMAN AND LINDEN.

Introductory Note by Dr. Stansfield.

When undertaking the present investigation I considered that it was very important to decide whether the high Swedish furnace or the simpler pit furnace used at Heroult would be the more suitable under the conditions existing in British Columbia.

I was familiar with the Swedish furnaces, but not with the Californian furnace, and I therefore visited San Francisco and Heroult. At San Francisco I met Messrs. Beckman and Linden, an engineering firm who have specialized in electric smelting and had recently erected a plant

for the production of ferro-alloys at Bay Point. Mr. Beckman is familiar with conditions in Sweden as well as in California, and I therefore discussed with him the design of furnace and plant for the production of pig-iron. In spite of his knowledge of the Swedish type of electric furnace, Mr. Beckman concluded that a simple pit furnace of the kind used for making ferro-alloys would, on the whole, be better than the Swedish furnace for the conditions in British Columbia. Such a furnace is substantially the same as the furnace that has been used at Heroult, with the exception of the roof and charging-chutes. In view of Mr. Beckman's knowledge of Sweden and California and of his experience in designing, erecting, and operating the plant at Bay Point, I asked him to prepare a design for an electric-smelting plant in British Columbia. The general outline of the plant was arranged between us, and I furnished him with the necessary data in regard to the nature and cost of the ore, charcoal, power, and labour. I understood that he would give an estimate for the consumption of power and charcoal per ton of pig-iron, but Mr. Beckman finally decided to take my figures for these items as the basis for his report.

I had in mind at that time a plant which would contain:—

Three 3,000-kw. furnaces for smelting ore.
Three 300-kw. furnaces for smelting ferro-alloys.
Two 1,500-kw. furnaces for making steel.

At first, however, the building was to be large enough for two 3,000-kw. and three 300-kw. furnaces; and only one of the 3,000-kw. furnaces, together with the three 300-kw. furnaces, were at first to be installed. Unfortunately, Mr. Beckman based his design of the plant and his estimate of the cost of making iron on the smallest equipment considered, which was only intended to be temporary, and on this account his estimate of the cost per ton of making pig-iron is higher than necessary.

ELECTRIC PIG-IRON IN BRITISH COLUMBIA.

REPORT BY BECKMAN AND LINDEN ENGINEERING CORPORATION, SAN FRANCISCO, JULY, 1918.

GENERAL REMARKS.

The following report is made at the request of, and is based upon figures which have been supplied by, Dr. Alfred Stansfield, of McGill University, Montreal, and has reference to a possible pig-iron industry in British Columbia. All of the conclusions reached are based upon and deduced from information received in this manner.

LOCATION OF PLANT.

In British Columbia there is available a considerable amount of developed hydro-electric power and also a large amount of power which is awaiting development. It would be considered advisable in connection with this investigation to locate the proposed pig-iron plant at a place where already developed power is available, and in such locality that the raw materials essential in this industry are obtainable with the least effort. We may take, for example, such a point as Port Moody, approximately ten miles distant from Vancouver. This community has access to the Canadian Pacific Railway and also deep-water facilities. The British Columbia Electric Railway Company, Limited, have transmission-lines already in Port Moody. Port Moody has a small electric furnace operating for the manufacture of other products, which would facilitate the obtaining of labour to some extent for the undertaking along the lines suggested.

GENERAL OUTLINE OF PROJECT.

It is a well-known fact that in Sweden great quantities of pig-iron are manufactured by means of reducing iron ore in electric furnaces, utilizing charcoal as reducing agent. The conditions existing in Sweden and those existing in British Columbia are very similar. It therefore suggests itself that the manufacture of pig-iron in British Columbia should offer opportunities similar to those in Sweden. The project here would be based on four units. The first to be installed would consist of one 3,000-kw. furnace and possibly three 300-kw. single-phase furnaces; the former furnace for the purpose of manufacturing pig-iron, and the latter furnaces for the purpose of manufacturing ferro-alloys, such as ferro-molybdenum, ferro-chrome, ferro-tungsten, and others. The next step would be the addition of a 5,000-kw. furnace for the manufacture of pig-iron, or it might be thought more advisable to put in a 10,000-kw. furnace for this purpose. The difference in operation and equipment between a 3,000-kw. and a 5,000-kw.

furnace is not very material and would only involve an increase in production, while the operation and equipment of a 10,000-kw. furnace would be materially different and a distinct development over a 3,000-kw. furnace. Of course, the investment on a 10,000-kw. furnace would be considerably greater than on a 5,000-kw. furnace, and on that account it might be considered advisable to take an intermediary step. The furnaces would be built in such a manner that they could easily be adapted to manufacturing other alloys, such as ferro-silicon. The purpose of this would be to make the plant as flexible as possible, so that in case the price of pig-iron went down the plant could be used economically for other purposes.

Raw Materials.

In the manufacture of pig-iron the essential raw materials are:—

A. Cheap electric power.
B. Iron ore.
C. Reducing agent, such as charcoal.
D. Fluxing agent.
E. Electrodes.

A. Hydro-electric Power.—The amount of power necessary to produce 1 ton of pig-iron in the electric furnace is dependent to a great extent upon the purity of the ores. The iron ore which is available for this undertaking would consume approximately 0.5 horse-power per year per ton of pig-iron. In case the ore was concentrated up to 65 per cent. iron content, it would take 0.4 horse-power per year per ton of pig-iron. It is apparent from the following cost data that the power cost is one of the large items, and to make such an undertaking successful it is essential that low power prices are obtainable. It is understood that the British Columbia Electric Railway Company, Limited, has available 10,000 horse-power, 60-cycle power, that could be put into service immediately. Later developments of this industry would necessitate the development of new hydro-electric power sites in close proximity to raw materials.

B. Iron Ore.—The raw material on which the whole industry is based is the iron ore. There are a number of iron-ore deposits in British Columbia on the mainland, as well as on the islands, and it would be a question of its availability to Port Moody which would partially govern as to its use in this undertaking. The ore which has been suggested is a magnetite ore containing lime of an average analysis of:—

	Per Cent.
Iron	50 to 55 (Fe_3O_4 69-76%).
Silica	5 to 6
Alumina	4
Phosphorus	0.02
Sulphur	0.1
Calcium carbonate, etc.	15 to 21

The ore is claimed to be practically self-fluxing and would on that account not necessitate the use of any fluxing agent whatsoever. In a general way this ore is low in its iron content for a very successful pig-iron operation. If there were some ore of higher grade available and at a low price, it would be strongly advisable to consider these deposits in preference to the iron ore under discussion. There is, though, a means by which this ore could be brought up to a higher degree of purity, which would involve a concentrating plant and the sintering of the obtained concentrates. This would, of course, increase the cost of the ore and would give a higher iron content of ore material to work with, which would increase the output per horse-power year in the electric furnace. It would therefore appear that, if no other ore is available, a concentrating plant would be advisable.

C. Reducing Agent.—In the Swedish practice where electric pig-iron is produced charcoal is used as a reducing agent. This is obtained as a by-product from the large lumber and timber operations in Sweden, where pine, spruce, and fir are handled, and there is no timber operation in Sweden of any kind where the refuse is not turned into charcoal either in a by-product charcoal-oven or by pit-charcoaling. British Columbia, as we understand it, has large timber operations, as well as large stands of timber, that in many cases are worthless for timber purposes. These waste lands might be gone over and the timber turned into charcoal, as well as by-products, such as alcohol, acetic acid, creosote-oil, and also turpentine. The creosote-oils are used extensively in flotation purposes where the metal values are separated from the gangue. Charcoal obtained in such a manner, either in by-product coke-ovens or in pit-charcoaling, contains approximately 73 per cent. fixed carbon.

British Columbia holds in its bituminous-coal deposits another reducing agent that under special conditions may be used to advantage. It is high in ash and reported to contain 50 per cent. fixed carbon.

It has also been suggested as a possibility to utilize some of the oil-wastes obtainable on the Pacific coast as a reducing agent in making pig-iron. This material contains practically no ash and about 70 per cent. of fixed carbon.

D. Fluxing Agent.—As has been explained under the heading "Iron Ores," the iron ore proposed to be used in this undertaking would not need any fluxing material. Limestone, though, as a rule is used for this purpose, and is available at various points accessible to Port Moody in a purity suitable for this operation.

E. Electrodes.—All electric-furnace operations for the reduction of ores are dependent on the supply of electrodes. Electrodes are the means by which the electric current is made available in the furnace. There are plants on the Pacific coast which are manufacturing electrodes, and there are large manufacturers of electrodes in the East, both in Canada and the United States. It would seem as though an undertaking of this kind in British Columbia should depend upon its electrode-supply from a Pacific Coast source, and it would be advisable to make an early arrangement with the manufacturers there for this essential.

General Plant Layout.

The plant would be composed of the main furnace building, adjacent to which would be the transformer building. The furnace building would give ample space for the furnace and the necessary electrical connections, as well as the casting-floor on to which the pig-iron would be tapped. This building would have a big electric travelling crane and also the necessary tracks for the purpose of moving raw materials about and moving the finished products. The initial size of the building would be one which could house a 3,000-kw. furnace and three 300-kw. single-phase furnaces. Buildings, such as storehouse, laboratory, office, wash-house, etc., would be placed at convenient points on the ground. The necessary trackage would have to be laid out in the yards for the handling of all materials and incoming and outgoing shipments. Ample storage-space would be necessary in the yards for the storing of raw materials. There should be approximately sixty days' supply of iron ore in stock, amounting to approximately 4,000 tons. Storage-space should also be provided for a large tonnage of charcoal. The amount that would have to be kept in storage would depend upon the physical conditions surrounding the plant and the accessibility to the charcoal-producing installations. It would be advisable to plan for the necessary roof-sheds to cover two to three months' supply of charcoal. In case any fluxing agent should be needed, space should be provided for the storage of same. Electrodes could be stored in suitable numbers in a small building. To handle efficiently the raw materials and finished product from stock-piles to dump-cars, etc., a locomotive crane would be needed.

Type of Furnace.

The type of electric furnace in which pig-iron is made in Sweden has a close resemblance to the shaft-furnace. The shaft carrying the burden is supported by braces, and the reduction takes place in a big bowl at the bottom of the shaft, into which the electrode projects. There is a heavy strain on the structure in general, and the refractory roof of the furnace itself receives very severe treatment and frequently needs rebuilding. It has been carefully considered in this connection that it would be advisable to try out a simpler furnace very similar to those used in the manufacture of ferro-silicon and ferro-manganese—a simple 3-phase open-pit furnace. By installing this kind of a furnace and holding the Swedish shaft-furnace in reserve, if the tests work out as anticipated, a saving in installation will take place and a step forward will have been made in the manufacture of pig-iron. It is expected to produce in such a furnace grey pig-iron containing 3 to 4 per cent. carbon, 2 to 3 per cent. silicon, 0.05 per cent. sulphur, and 0.5 per cent. phosphorus. If the results do not come up to expectations, the furnace can readily be adapted to manufacturing ferro-silicon or ferro-manganese and a duplication of the Swedish furnace can be installed. The Swedish shaft-furnaces are beyond the experimental stage, working successfully day in and day out in manufacturing white pig-iron. Some trouble has been encountered in manufacturing grey pig-iron in these furnaces. The white pig-iron, though, is used very successfully in open-hearth furnaces and in electric steel manufacture.

COST OF PLANT.*

(At 1918 Prices of Apparatus and Construction.)

One 3,000-kw. 3-phase furnace, installed, including casing, electrode-holders, jib-cranes, regulators, and foundations	$ 15,000
Four 1,000-kw. single-phase, 33,000-volt primary, 60-cycle oil-insulated and water-cooled transformers, installed, with from 60 to 120 volts in 5-volt steps on the secondary side (one of these transformers is spare)	26,000
One set low-tension busses for 3,000-kw. furnace, installed	5,000
One set high-tension busses for 3,000-kw. furnace, including oil-switches, switchboard, and meters	6,000
Three 300-kw. single-phase furnaces, installed, including casing, electrode-holders, and regulating device	10,000
Four 300-kw. 33,000-volt primary, 60-cycle, single-phase, oil-insulated and water-cooled transformers, installed, with a range of from 70 to 100 volts in 5-volt steps on the secondary side	10,000
Three 50-kw. single-phase, 60-cycle, 33,000 volts to 440 volts air-cooled transformers, installed, with switchboard (to be used for industrial purposes around plant)	2,000
One 25-kw. motor-generator set for regulators, etc., installed	2,000
Three sets low-tension busses for 300-kw. furnaces	1,500
One furnace building, built entirely of reinforced concrete, including electric travelling crane, tracks, metal-handling equipment, etc.	35,000
One transformer building, built entirely of reinforced concrete	10,000
One shipping-store building of wood and stucco exterior finish	7,000
One laboratory with complete equipment	7,500
One store-room and change-room building, built of wood and exterior stucco finish, including steel lockers, toilets, wash-basins, and shower-baths	8,000
One machine-shop with equipment	10,000
One office building	3,000
One gate-house with time-clock and time-keeper's office	500
Railroad tracks, industrial track, ore-handling equipment, water-supply, sewerage, fence, and industrial lighting, etc.	25,000
Land, 4 acres	4,000
	$187,500
Engineering and contingencies, 20 per cent.	37,500
Total	$225,000

It is well to point out that the above figures cover the cost of a plant that is built entirely of permanent construction. Permanent-construction figures in the first cost are higher than any temporary work, of course; but due to the great fire risk of temporary work, such as wooden construction, it is deemed more advisable to make the larger initial investment to cut down the maintenance cost of a temporary plant.

The electrical equipment selected and put into this estimate is such that, according to our experience with identical design and equipment, a power factor can be obtained on the power company's line as high as from 90 to 92 per cent.

COST OF PRODUCTION.

Two sets of figures have been made out on the cost of production of pig-iron. The pig-iron which is supposed to be produced is grey foundry pig-iron, and would have a market value of $35 per ton at the plant. The figures which have been worked out are based on crude ore and concentrated ore, assuming that the crude ore would be obtained in one case for $4 per ton, and in the other case increased to $6.45 per ton by concentration. Another set of figures is based

* In this cost estimate is not included ore-concentrating and sintering plant, nor charcoal plant.

on price of crude ore at $1.50 per ton, and concentrated ore at $3.20 per ton. This includes the cost of concentrating and sintering, amounting to $1.25 per ton concentrate. The power is assumed to be delivered at the switchboard at $15 per horse-power year. The reducing agent—charcoal—is assumed to be obtained at a price of $6 per ton ($6 per ton being the price for British Columbia coal), and $7 per ton the price of oil-waste carbon. In the following figures charcoal only has been taken into consideration, though the amounts of the different reducing agents needed to reduce 1 ton of 55-per-cent. ore are as follows:—

	Ton.
Charcoal containing 73 per cent. fixed carbon	0.5
British Columbia coal, 50 per cent. fixed carbon	0.8
Oil-waste carbon, 70 per cent. fixed carbon	0.6

In producing from an ore containing 55 per cent. iron, 2 tons per horse-power year is estimated as a safe figure upon which to base calculations. On ore containing 65 per cent. iron, 2.5 tons per horse-power year production is assumed a safe figure upon which to base calculations. It is evident from the above that operating with a 55-per-cent. ore in a 3,000-kw. furnace would give an annual production of 8,000 tons of pig-iron, while the annual production obtained in a 3,000-kw. furnace with concentrated ore would be 10,000 tons of pig-iron. The operation of the furnace would be continuous twenty-four hours' operation and would be operated in three shifts. The costs would be as follows:—

$4 per Ton Crude Ore (50 Per Cent. Iron).

Electric power, 0.5 h.-p. year at $15 per h.-p. year	$7 50
Iron ore, 2 tons at $4 per ton	8 00
Coal, ½ ton charcoal at $6	3 00
Electrodes, 20 lb. per ton of metal produced at 10 cents a pound	2 00
Labour	8 00
Supplies	1 00
Plant and office general expense	5 00
Interest on investment and depreciation, 20 per cent.	4 50
Total	$39 00

Total Production, 8,000 Tons Pig-iron.

Gross earnings at $35 per ton	$280,000
Cost to manufacture at $39	312,000
Deficit	$32,000

Crude Ore at $1.50

Electric power, 0.5 h.-p. year at $15 per h.-p. year	$7 50
Iron ore, 2 tons at $1.50 per ton	3 00
Coal, ½ ton charcoal at $6	3 00
Electrodes, 20 lb. per ton of metal produced at 10 cents a pound	2 00
Labour	8 00
Supplies	1 00
Plant and office general expense	5 00
Interest on investment and depreciation, 20 per cent.	4 50
Total	$34 00

Total Production, 8,000 Tons Pig-iron.

Gross earnings at $35 per ton	$280,000
Cost to manufacture at $34	272,000
Net profit	$8,000

$6.45 per Ton Concentrated Ore (65 Per Cent. Iron).

Electric power, 0.4 h.-p. year at $15 per h.-p. year	$6 00
Iron ore, 1.54 tons at $6.45 per ton	9 93
Coal, ½ ton charcoal at $6	3 00
Electrodes, 20 lb. per ton of metal produced at 10 cents a pound	2 00
Labour	6 40
Supplies	1 00
Plant and office general expense	5 00
Interest on investment and depreciation	2 81
Total	$36 14

Total Production, 10,000 Tons Pig-iron.

Gross earnings at $35 per ton	$350,000
Cost to manufacture at $36.14	361,400
Deficit	$11,400

Concentrated Ore at $3.20

Electric power, 0.4 h.-p. year at $15 per h.-p. year	$6 00
Iron ore, 1.54 tons at $3.20 per ton	4 93
Coal, ½ ton charcoal at $6	3 00
Electrodes, 20 lb. per ton of metal produced at 10 cents a pound	2 00
Labour	6 40
Supplies	1 00
Plant and office general expense	5 00
Interest on investment and depreciation, 20 per cent.	2 81
Total	$31 14

Total Production, 10,000 Tons Pig-iron.

Gross earnings at $35 per ton	$350,000
Cost to manufacture at $31.14	311,400
Net profit	$36,600

It is from these figures very apparent that it would be impossible to go into the pig-iron manufacture using unconcentrated ores; while operating with concentrated ores at $3.20 shows a reasonable return.

Electric Steel-furnace.

It would seem as a logical arrangement in connection with the pig-iron furnace to establish an electric steel-furnace, in which special steel will be manufactured. There is no possibility at the present time for an iron industry on the Pacific coast to compete with Eastern production of heavy steel material. There is a field here legitimate and profitable to manufacture special shapes of light rolled metal, as well as steel castings. With all the mining industries going on in the West and with the ship-building industries growing out here at a pace, there is an urgent need for special alloy steel and special electric steel castings. The raw materials for the alloy steel are available on the Pacific coast and could be readily smelted and put into steel products. The material which comes out of the pig-iron furnace would be carried in a ladle in a molten condition to the steel-furnace, and in such a manner cut down the melting cost and refining cost of the finished steel product. It is certain that better financial success would be made by installing an electric steel-furnace in conjunction with the pig-iron manufacture and a rolling-mill than by operating the plant exclusively on pig-iron.

Ferro-alloy Furnaces.

The three 300-kw. furnaces can be used for the manufacture of alloys which could easily be used in the production of steel. The operation of these furnaces could be carried on easily in conjunction with the large 3,000-kw. furnace.

Conclusions.

The foregoing report shows the following:—

(1.) That conditions in British Columbia lend themselves well to the manufacture of pig-iron under special conditions.

(2.) That the successful manufacture of pig-iron in British Columbia is dependent upon a low-priced iron ore.

(3.) That British Columbia holds by virtue of its large supply of timber and its deposits of bituminous coal two reducing agents suitable for the manufacture of pig-iron.

(4.) That cheap hydro-electric power delivered at a figure not higher than $15 per horse-power year is essential.

(5.) That the concentrating and sintering of concentrates before the ore is used in the furnace is essential in the manufacture of pig-iron from British Columbia ore.

(6.) That a steel industry in conjunction with the pig-iron furnace and alloy-furnaces is a more advantageous undertaking than a pig-iron industry exclusively.

Beckman & Linden Engineering Corporation.

(Signed.) J. W. Beckman, *President.*

Cost of manufacturing Ferro-silicon.

(Appendix to Beckman & Linden's Report.)

In the foregoing report reference is made to the possibility of utilizing the furnace suggested there for the manufacture of ferro-silicon. The following figures would indicate the cost of producing 1 ton of metal and the returns which would be obtained:—

Power at $15 per horse-power year	$15 00
Quartz, 2,400 lb. at $3.60 per ton	4 20
Coal, 1,210 lb. at $6 per ton	3 63
Turnings, 1,500 lb. at $10 per ton	7 50
Electrodes, 60 lb. per ton of metal at 10 cents per pound	6 00
Labour	16 00
Supplies	1 00
Plant and office general expense	5 00
Interest on investment and depreciation, 20 per cent.	9 38
Total	$67 71

The total output of this plant would be about 4,000 tons of 50-per-cent. ferro-silicon per year, and, assuming that 50-per-cent. ferro-silicon sold for $150 per ton, the net profit would be:—

Gross earnings at $150 per ton	$600,000
Cost to manufacture at $67.71 per ton	270,840
Net profit	$329,160

APPENDIX XII.

A NEW METHOD OF PRODUCING ELECTRIC-FURNACE IRON.

The operation of smelting an ore of iron for pig-iron includes two distinct steps, which are, however, carried out in the same furnace and to some extent simultaneously.

The first step is one of reduction, in which the ore, consisting largely of oxide of iron, is converted into metallic iron by means of carbon or carbonaceous gases. The second step is one of fusion, in which the metallic iron, already formed, is melted and becomes pig-iron. The gangue of the ore, together with the flux, is also melted and forms slag.* The first step can be carried out at a moderate temperature of, say, 700° or 800° C., while the second step needs a very high temperature, say, 1,400° or 1,500° C. Although the first step can be effected at a lower temperature than the second, it consumes about twice as much heat, measured in calories or kilowatt-hours, and it is this large requirement of heat that renders so costly the electric smelting of iron ores. That this is practically true will be made clear when I mention that a ton of steel can be melted in an electric furnace by means of 600 or 700 kilowatt-hours, whereas about 2,500 kilowatt-hours are needed to produce a ton of pig-iron from the ore.

In the electric furnace both steps of the smelting operation are carried out more or less simultaneously, and at a high temperature; and this causes waste of heat and unnecessary expense, particularly as the heat is derived from costly electrical energy. The smelting operation produces a large amount of hot carbonaceous gases, which in a simple electric furnace escape and burn above the charge. These gases may be utilized for heating and reducing the ore, and the Swedish furnace is provided with a large shaft for this purpose. A careful analysis shows, however, that the most efficient furnace of this type is decidedly inefficient from an economic point of view; and we are led to consider whether better results can be obtained in some other way.

I have thought, for a long time, that greater economy could be obtained by separating the two stages of the smelting process and carrying them out in separate furnaces. The ore, crushed to a coarse powder, would be reduced to the metallic condition by means of carbon in one furnace using fuel-heat, and the metallic powder would then be melted electrically. It appears that in this way a pig-iron of electric-furnace quality could be obtained more cheaply than by direct electric smelting.

Until recently I had no experimental evidence in regard to the preliminary reduction of the ore, and had intended to undertake a series of experiments for this purpose; but during the last few months I have obtained information with regard to this point, which makes it seem probable that the process can be carried out practically, and that a decided economy will be gained by its use.

The possibilities of the process will be made clear by the following numerical discussion:—

The reduction of magnetite by carbon will probably follow the equation: $Fe_3O_4 + 3C = 3\ Fe + 2\ CO + CO_2$. This requires 115,000 calories for the reduction of 1 kilogram molecular weight of magnetite, or 686 calories per kilogram of iron. This corresponds, if electrical heat is used, to 800 kilowatt-hours per metric ton of metallic iron.

The heat required to melt 1 ton of cast iron would be (theoretically) about 300 kilowatt-hours, but for the production of foundry pig-iron there would be needed an additional 175 kilowatt-hours for the production of silicon, or a total of 475 kilowatt-hours for the melting operation. Thus in round numbers there will be needed:—

	Kw. Hrs.
For reducing the iron ore to metal	800
Converting this into foundry pig-iron	500
Total	1,300

It will be noticed that I have made no specific allowance for melting the slag. This is because the gangue will be practically eliminated by magnetic treatment before fusion, and thus there will be scarcely any slag to melt.

* Actually the second stage is more complicated than I have indicated, as the iron in fusion absorbs carbon and silicon to form pig-iron, the silicon itself being derived from the silica in the ore.

In electric furnaces a working efficiency of at least 70 per cent. can usually be obtained, and therefore we find as the actual operating charges for the two stages:—

	Kw. Hrs.
For reducing the iron ore to metal	1,140
For reducing silicon and melting the iron	710
Total	1,850

The total power requirement shows a decided economy when compared with the 2,500 kilowatt-hours that would be needed for the direct smelting of the ore, even after making allowance for the cost of crushing, magnetic treatment, and double handling of the material. The first or reducing stage can, however, be carried out by means of fuel-heat instead of electrical heat without detracting from the purity of the product. The operation would have to be carried out in some kind of a muffle-furnace, as the reduced metal must be protected from the air and from furnace gases, and the efficiency of the heating fuel would consequently be very low. As, however, cheap fuel, such as waste wood, can be employed, this will not cause any serious expense. The heat theoretically needed for the reduction of the iron ore is 686,000 calories per metric ton of iron; allowing 25 per cent. efficiency, this would mean 2,744,000 calories, which would be furnished by 0.4 ton of a low grade of coal. It would appear safe, therefore, to allow for this purpose ½ ton of local coal or an equivalent amount of waste wood.

Dr. Trood and Mr. W. A. Darrah have carried out a series of experiments at Heroult, in California, on the reduction of pure magnetite ore to metallic iron. The work has been done in a small furnace making a few pounds per hour of reduced iron. This furnace was heated electrically, and in this way an exact determination could be made of the heat that was supplied to it. There was under construction at the time of my visit a large furnace for the reduction of ore which was to be heated by means of fuel. Since my visit Mr. Darrah has been made superintendent of the plant, and this has no doubt interfered with the progress of the experiments. He has, however, written me the following letter with regard to the cost of operating the Trood-Darrah process. I assume that the power-consumption used in this estimate is deduced from their small-scale experiments, and that the other expenses refer to a plant making 100 tons of metallic iron daily.

"Noble Electric Steel Company,
Heroult, Shasta County, Cal., October 23rd, 1918.

"Regarding the questions which you have raised, I have to advise as follows:—

"(1.) We have made a very substantial success in reducing magnetite-iron ores to metal by heating to a moderate temperature with carbonaceous reducing agents.

"(2.) Reduction begins in the neighbourhood of 700° C., but in order to carry the reaction to completeness, as well as to minimize the time required, we find it expedient to operate at approximately 800° C.

"(3.) For a perfect reduction of particles the size of coarse sand, with the magnetite ore that we are using we find that three hours are required. The time will vary considerably with the different grades of ore, different reducing agents, and different temperatures. Powdered charcoal is the most satisfactory reducing agent, but, of course, is not the only successful one.

"(4.) Total cost per ton of iron product, making ample allowance for power, fuel, etc., about $19.

"The costs are divided as follows:—

Item.	Cost per Ton.	Quantity required.	Total Cost per Ton of Iron.
Power for drying and reduction	½ cent per kilowatt-hour	1,200 kilowatt-hours	$6 00
Charcoal	$25 per ton	570 lb.	7 10
Ore	$3 per ton	2,760 lb.	4 15
Crushing materials	50 cents per ton	....	69
Handling materials	50 cents per ton	....	69
Labour and supervision	....	....	50
Interest and Depreciation, $20,000 Investment	....	....	10

"The above cost may appear rather high, depending upon your local conditions. It is, of course, a direct result of the price of such materials as reducing agents and iron ore, which you will note total considerably over 50 per cent. of the entire cost. The power cost, you will note, is less than one-third of the total cost.

"Dr. Trood and I consider it quite feasible to reduce the iron by our process, and melt it either electrically or after briquetting in an open-hearth furnace. It is then perfectly feasible to make either pig-iron or steel, as the market may demand."

With regard to Mr. Darrah's estimate, I may state:—

(1.) Assuming the ore to contain 67.8 per cent. of iron (published analysis), 2,760 lb. of ore would only yield about 1,870 lb. of metallic iron. It would appear from this that the estimate does not refer to a ton of pure iron, but to a 2,000-lb. ton of an impure iron product containing about 93 per cent. of iron. As this is about the percentage in foundry pig-iron, we need only increase the estimate by about 15 per cent. to provide for the change from the short ton to the long ton and for the mechanical losses in the various operations.

(2.) Mr. Darrah's estimate of 1,200 kilowatt-hours, if increased by 15 per cent., would give 1,380 kilowatt-hours, whereas my estimate, based on calculation, was 1,200 kilowatt-hours. We should for the present take the larger figure, which increases the cost by 90 cents.

(3.) The estimate of 570 lb. of charcoal, increased by 15 per cent., comes to 655 lb. This figure is supported by calculation from the equation I gave above, and I am estimating on a consumption of ⅓ net ton of charcoal; the cost of this in British Columbia will be only about $2.

(4.) The remaining items of cost must be increased by about 50 per cent. on account of the larger amount of ore to be handled. Apart from this, I cannot check them in any detail, but suppose that they would be rather higher under British Columbian conditions. The charges seem to be very small, but it should be remembered that the operation will be continuous and mechanical throughout; there will be no hard labour required, and the cost for labour, superintendence, and maintenance of plant should be small.

The following estimate of the cost of making 1 long ton of metallic iron in the form of powder by the Trood-Darrah process has been prepared in view of conditions in British Columbia:—

Cost of One Long Ton of Metallic Iron, using Electrical Heat at ½ Cent per Kilowatt-hour.

Ore, 2.2 tons at $4	$ 8 80
Charcoal, ⅓ ton at $6	2 00
Power for heating, 1,380 kilowatt-hours at ½ cent	6 90
Crushing materials at 50 cents per ton	1 10
Handling materials at 50 cents per ton	1 10
Labour and supervision	85
Interest and depreciation	25
Total	$21 00

In this estimate I have taken 2.2 tons of ore instead of 2 tons in order to cover the loss in magnetic concentration which would form the first step in the process.

If fuel can be used for heating in this operation the cost will be further reduced; thus the heat should be obtainable by the use in gas-producers of ½ ton of low-quality coal costing, say, $4 per ton. The cost of heat would thus be $2, or at the outside $2.50, and the total cost of the iron $16 or $17 per ton.

With regard to these figures, I must state clearly that, although I have full confidence in Mr. Darrah's statements, yet the operation of the process must be demonstrated on a working scale and its applicability to British Columbian ores must be shown before a commercial enterprise can be undertaken.

I should also state that I believe that foundry pig-iron can be obtained, conveniently and economically, by melting the iron powder with fluxes in an electric furnace. It will be necessary, however, to confirm this point experimentally, and also to ascertain whether the sulphur originally present in the ore will be removed sufficiently well by the proposed process.

The following estimate will give some idea of the cost of 1 ton of foundry iron obtained by melting the reduced powder in an electric furnace:—

Cost of One Long Ton of Foundry Pig-iron.

Reduced metallic powder	$17 00
Electric power, 750 kilowatt-hours at ½ cent	3 75
Charcoal, $^1/_{10}$ ton at $6	60
Electrodes, 7 lb. at 8½ cents	60
Fluxes and supplies	55
Labour	2 00
Management	1 00
Interest and overhead charges	1 50
Total	$27 00

Another favourable feature of the reduction process is that the metallic powder can be melted in electric furnaces for the production of steel without the need of first turning it into pig-iron. In this way one step of the usual process is eliminated and electric-furnace steel may be produced at very reasonable figures.

REDUCTION OF IRON ORE BY HYDROGEN.

As having a bearing on the above process, I add a brief account of the reduction of iron ores by means of hydrogen. Mr. A. T. Stuart, of Toronto, invented an improved form of apparatus for the production of hydrogen and oxygen by the electrolysis of water. In trying to find uses for the hydrogen, he discovered that iron ores are reduced to metal by means of hydrogen at so low a temperature as 700° C. The process is very convenient, because the hydrogen can be passed again and again through the ore, so that the gas is perfectly utilized. Such a process, however, would only be possible if hydrogen could be obtained extraordinarily cheaply. To produce it by electrolysis would need unusually cheap electric power, and the ore could be smelted directly with less power than would be needed to make the hydrogen and to carry out the reduction with its aid. The only condition under which the process could be employed would be if there were available during off-peak periods of a power plant large amounts of direct-current power, which could be obtained at a very low price, and if, in addition, there was a satisfactory market for the electrolytic oxygen, so that the hydrogen might be regarded as a by-product. I must add, also, that Mr. Stuart's experiments were made on hæmatite ores, and it is likely that magnetites may not be reduced so easily or at so low a temperature. One feature of the process which may prove important is that the hydrogen used to reduce the iron also serves to remove from it phosphorus and sulphur in a gaseous form.

STEEL DIRECT FROM THE ORE.

(A Process described by F. T. Snyder.)

I conclude this Appendix with an extract from a paper on "Steel Direct from the Ore," which was sent to me recently by Mr. F. T. Snyder, of Chicago, the inventor of the Snyder electric steel-furnace. I quote Mr. Snyder, as I consider that his account is of interest in connection with the present investigation, but I do not endorse his process or assume any responsibility for his statements:—

"To expose sufficient surface for rapid reduction the ore is crushed to ¼ or ⅛ inch in diameter. From an ore-storage bin it is fed into a cylindrical kiln in which the ore is dried and heated to 700° C. under oxidizing condition. The sulphur contents of the ore will be substantially eliminated in this preliminary roasting. At 700° C. the ore falls into a reducing-kiln, in which it is exposed to the action of carbon-monoxide gas, which reduces the iron oxide to metallic iron sponge. This iron sponge is conveyed without exposure to air, and while still hot, to an air-tight electric furnace. The reducing carbon-monoxide gas is generated in a gas-producer from powdered coal giving a hot gas low in carbon dioxide. At the part of the reducing-kiln where the iron ore enters, this gas leaves the kiln with about the same composition as the gas leaving the top of a blast-furnace. Part of this gas passes into the roasting-kiln, where it is burned with air from a fan to furnish the heat required to raise the ore to 700° C. before it enters the reducing-kiln. The balance of the gas from the reducing-kiln is burned under a boiler, and with the steam the necessary power is produced for the electric-smelting furnace. By a fortunate coincidence the amount of gas available is somewhat more than the amount needed by the electric furnace.

"This arrangement of equipment meets the three fundamental difficulties of the earlier attempts to make steel direct from ore, and retains the great commercial advantages of the direct method. By the use of fine ore in rotating-kilns, which both expose the ore to the acting gases and at the same time convey it, the difficulty of getting the iron sponge out and trapping the gas is made easy by the low pressure required to pass the gases through the kilns. The electric furnace melts the sponge without oxidation and eliminates the second difficulty. The use of a preheating-kiln which is separate from the reducing-kiln makes it possible to remove the reducing gases from contact with the ore before the gas is cooled to a temperature at which carbon-deposition begins, and furnishes a sponge that is practically free from carbon and ready to melt direct to steel. As the reduction is entirely by carbon-monoxide gas, no solid carbon coming in contact with the ore, the silica, phosphorus, and titanium in the ore are not reduced, but remain in their original form and are melted in the slag in the electric furnace, substantially none of them entering the steel.

"Compared with the direct method of smelting iron ore with electricity, the kiln method, with electric-furnace finishing, has the advantage of a much lower electric-power consumption. The kiln method uses 600 kilowatt-hours per ton of steel produced for all power purposes. The direct electric smelting uses 2,000 kilowatt-hours for the electric smelting producing pig-iron, and 500 kilowatt-hours for the electric-furnace operation of changing the electric pig-iron to steel. When the weight of the electrodes for the pig-iron furnace are taken into account, and the fact that the kiln method uses charcoal from twigs and leaves, the total average of timber required for both methods is approximately the same. A production of 25 tons per day requires 1,000 kw. of power plant for the direct-steel method, and 3,000 kw. for the electric pig-iron method. The difference in the investment cost for power-plant construction is 50 per cent. greater than the total cost of the kiln plant, exclusive of its power plant. If water for power is available without cost, the burden of the investment cost renders the electric pig-iron method non-commercial in comparison with the direct-steel method.

"The economic advantages of this method are:—

"(1.) The use of iron ores of inferior composition. Sulphur is eliminated in the preliminary roasting. Silica, phosphorus, and titanium enter the slag.

"(2.) The use of fuel of inferior quality. As the fuel is burned in a producer in powdered form, raw coal, coke, or charcoal may be used. Sulphur in the fuel enters the reducing gas as sulphur-monoxide gas, which is without action on the iron at the temperatures used. Powdered fuels are in reliable use with ash as high as 20 per cent.

"(3.) The production of steel of electric-furnace quality. This is substantially higher in tensile strength, elastic limit, percentage of elongation, and resistance to shock than is Bessemer or open-hearth steel of the same analysis.

"(4.) The recovery of a high percentage of the iron in the ore. Practically all the iron in the ore passes into the steel, as the electric-furnace melting makes it possible and the production of good steel makes it necessary to produce a slag substantially free from iron. With the present blast-furnace, open-hearth or Bessemer combination, from 10 to 15 per cent. of the iron in the ore is lost in the slags produced.

"(5.) Existing methods use about 1 ton of coke in the blast-furnace per ton of pig-iron. This coke requires for its production 1⅔ tons of raw coal. To turn this ton of pig-iron into steel requires an additional ⅓ ton of raw coal burnt in gas-producers. This is a total consumption of 2 tons of raw coal per ton of steel produced. The direct method, including the gas for electric power and for roasting, requires 1 ton of raw fuel. As the fuel is used powdered, if charcoal is made the small twigs and the leaves may be carbonized as well as the larger pieces, substantially doubling the steel produced per acre of timber.

"(6.) The capital investment, including electric-power plant, is about two-thirds that of the blast-furnace, open-hearth combination for the same output.

"(7.) The production cost per ton of steel ingots is about 80 per cent. of the older practice.

"(8.) Plants for small production are practical with the direct-steel method, outputs as low as 25 tons per day being efficient.

"(9.) Production may be stopped or started in a few hours if necessary to meet market or traffic conditions, without plant deterioration, and without the production of considerable quantities of lower-quality product.

"(10.) As the equipment is low, the entire plant may be traversed by travelling cranes making repairs rapid and low in cost. This latter is also aided by the general low temperatures of operation.

"(11.) As the operation is mostly mechanical, the amount of labour required is small. Skilled labour required only for supervision.

"(12.) As the gas-pressure used is low and no large quantity of molten material is held at a time, the safety of operation is materially greater than with the blast-furnace and open hearth."

APPENDIX XIII.

AUXILIARY INDUSTRIES.

In view of the limited market for foundry pig-iron in British Columbia, it will be essential to make other products, so as to increase the output of the plant. For this purpose an additional output of low-silicon pig-iron can be made, and this can be melted with steel scrap for the production of steel. Ferro-alloys, such as ferro-silicon, ferro-manganese, and ferro-chrome, can also be made in an electric-smelting plant. These auxiliary industries not only increase the general output of the plant, thus reducing, proportionately, the overhead charges, but are themselves likely to yield a higher profit than the production of pig-iron. The production of ferro-manganese and ferro-chrome in the electric furnace depends upon a supply of ores of manganese and of chromium. Quartz is required for the production of ferro-silicon.

Ferro-alloys.

Ores of Manganese and Chromium.—I have been furnished by Mr. W. F. Robertson with the following information, which indicates that there would be a sufficient supply of ores of these metals of a grade suitable for the production in electric furnaces of ferro-manganese and ferro-chrome. Quartz for the production of ferro-silicon can also be obtained.

The Curle Manganese Group.

Report by A. G. Langley, Resident Engineer, Revelstoke, June, 1918.

Report of Assays by the Provincial Government Assayer.

(Signed.) D. E. WHITTAKER.

Report on the Ore-deposit by Mr. Langley.

"The property, consisting of ten claims, is situated at a distance of seven miles from Kaslo and adjoins the Kaslo & Nakusp branch line of the Canadian Pacific Railway.

"The group was staked by A. Curle, of Kaslo, in 1917, and although the ore is freely exposed along the old Kaslo-Slocan wagon-road it escaped attention for years, due no doubt to the lack of knowledge of the character and commercial value of the deposit. In February, 1918, the property was bonded by the original owners, A. J. Curle and A. G. Larson, to Col. F. B. Millard, of Spokane.

"Seventeen men are now employed and considerable progress has been made during the last month in developing and winning the ore.

"*Character of the Ore.*—The ore chiefly consists of the soft black or brown oxides, which may be classified as wad manganese, while concretionary psilomelane, though in evidence, is less frequent in occurrence.

"*Ore Occurrence.*—At the No. 1 deposit the ore forms a blanket deposit over the surface of the flat, the average thickness of which is hard to arrive at, for its distribution is uneven and irregular, but can safely be taken as not exceeding 6 inches.

"From where the hill rises above the flat and for about 50 feet up the gentle slope, the ore, which occurs underlying a few inches of soil, shows about an average thickness of 1½ feet and appears to be of higher grade than that on the flat.

"At the No. 2 deposit the occurrence is similar to that of the No. 1, but appears to be more uniform and to contain a greater tonnage.

"This deposit has not been mined yet, and its area is less definitely outlined than that of the other. In an isolated patch at about 120 feet east of this deposit a small surface cut shows a 2-foot thickness of high-grade ore dipping slightly under a covering of about 3 feet surface wash; at this point a nice tonnage may be developed, but no work has been done to determine its extent.

"*Geology.*—Underlying the manganese-deposit, a layer of about 6 inches of soft material stained with oxide of iron is encountered, and under this a greenish clay containing pebbles and boulders of what is known locally as the Kaslo green schist. No attempt has been made to sink through the clay, which forms the floor of the deposit. Judging by the rock-exposures along the railway-cutting, the whole area is underlain by schists and slates, which have a dip of 53 degrees and a strike of N. 10° W.

"*Origin of the Deposit.*—The primary deposit of manganese probably owed its origin to deep-seated springs arising from a body of intrusive magma. These waters deposited their burden of lime, iron, manganese, and silica in veins and veinlets of the country-rock. During subsequent erosion and oxidation the manganese has been collected by surface waters and redeposited on the benches and gentle slopes of the hillside.

"The iron, being precipitated first from solution, forms the lower layer of the deposit, while the lime may have been an important factor in bringing about the precipitation of the manganese.

"That this secondary deposit is of fairly recent origin is demonstrated by the fact that it overlies glacial drift. The calcareous sinter which is invariably with the manganese, and generally overlying it, no doubt owes its origin to deep-seated springs, of which there are still a few active ones in the vicinity.

"*Mining.*—The ore being soft is easily mined by pick and shovel, but great care has to be exercised in obtaining a grade suitable for shipment, and a certain amount of sorting is necessary.

"On account of the difficulty in getting cars, no ore had been shipped up to the time of my visit. It was the intention of the owners to ship to Chicago.

"*Prices.*—The prices which were recently fixed in the United States range from 86 cents to $1.30 per unit for ore containing from 35 to 54 per cent. metallic manganese. (Refer.: *Eng. & Mining Journal*, June 8th, page 1053.) Freight rate to Chicago, $11.20 per ton.

"*Samples.*—No. 11675, taken from 800 sacks for shipment; Nos. 11676 and 11677, general grab sample of all dumps of ore, containing 110 tons; No. 11678, sample taken from a number of test-holes on No. 2 deposit; No. 11679, sample across 15-inch width of high-grade ore, No. 1 deposit; No. 11680, sample of overburden reject; No. 11681, sample of oxidized material underlying manganese.

"*Estimate of Available Ore for Shipment.*—Estimates of ore in-place are based on the assumption that 40 cubic feet equal 1 ton.

	Tons.
Total ore in No. 1 deposit	730
Less extracted	160
	570
Total ore in No. 2 deposit	835
Total	1,405

"On account of the irregularity of the deposit and the unsystematic way in which it has been prospected, the estimate is partly based on the amount that has been extracted from various areas, and where the deposit showed regularity, upon the cubic content.

"*Conclusion.*—So far the only bodies discovered that might be considered of commercial importance are the Nos. 1 and 2 deposits as shown on the plan, and although there are manganese indications in patches outlying these areas, at the present time there is not enough exposed to allow one to make an estimate of the possible ore which may or may not exist under a covering of surface wash, but the indications do not encourage one to believe that there is any large quantity.

"(Signed.) A. G. LANGLEY,
"*Resident Engineer.*"

Manganese Ore from Dickie's Claim, Cowichan Lake.

Samples taken by Mr. Turner, August, 1918.

Report of Assays by the Provincial Government Assayer.

Sample.	Manganese.	Insoluble.	Phosphorus.
	Per Cent.	Per Cent.	
No. 1, 4 feet	18.3	66.3	None.
No. 2, 6 feet	55.0	11.0	None.
No. 3, 5 feet	32.8	45.1	None.
Second lens	37.0	38.0	None.

(Signed.) D. E. WHITTAKER.

Mr. W. F. Robertson writes:— "August 14th, 1918.

"I enclose assay certificate of a manganese-deposit within a mile of the Canadian Pacific Railway and Canadian Northern Railway by wire tram, showing over 6 feet of 55-per-cent. Mn. ore carrying 11 per cent. SiO_2, with 4 feet of lower-grade ore on one side and 16 feet on the other. It looks as if we could guarantee 30 tons a day of best grade within sixty days, and possibly up to 100 tons."

Deposits of Chrome-iron Ore.

Report on Deposit at Scottie Creek by R. W. Thomson, Resident Engineer, Kamloops, May 10th, 1918.

Sample 11762 ..... 22.5 per cent. Cr_2O_3 and 27.2 per cent. silica.
Sample 11761 ..... 24.0 per cent. Cr_2O_3 and 35.0 per cent. silica.

II. Sample from Scottie Creek supplied by Provincial Mineralogist, July, 1918—

No. 1, 12974 ..... 40.5 per cent. Cr_2O_3 or 28.5 per cent. chromium.
No. 2, 12975 ..... 42.5 per cent. Cr_2O_3 or 29.5 per cent. chromium.
No. 3, 12976 ..... 24.8 per cent. Cr_2O_3 or 17.0 per cent. chromium.

Mr. Robertson informed me that there was an ample supply of this ore.

III. Sample from Juno Claim, Big Sheep Creek, supplied by P. B. Freeland, Resident Engineer, Grand Forks, July, 1918—

Sample 11471 ..... 36.0 per cent. Cr_2O_3 or 24.6 per cent. chromium.

PRODUCTION OF FERRO-ALLOYS IN THE ELECTRIC FURNACE.

The following notes on the technical requirements and the cost of making ferro-manganese, ferro-chromium, and ferro-silicon are based on information given me by Messrs. Beckman and Linden. I have, however, been able to compare their figures for the consumption of ore, electric power, and electrodes in some cases with those given in a valuable paper by R. M. Keeney, "The Manufacture of Ferro-alloys in the Electric Furnace," which was presented at the September, 1918, meeting of the American Institute of Mining Engineers. Beckman and Linden's figures refer in most cases to the operation of a 3,000-kw. furnace, and I have therefore made some

allowance for increased consumption of power, labour, etc., involved in the proposed use of a furnace of only 300 kw.

FERRO-MANGANESE.

This is made by smelting in an electric furnace a mixture of manganese ore, steel turnings, lime rock, coke, and charcoal. For the production of a long ton of 80-per-cent. ferro-manganese from an ore containing 43 per cent. of manganese the following amounts would be needed, using Beckman and Linden's figures:—

	Lb.
Manganese ore	4,700
Steel turnings	300
Lime rock	1,040
Coke and charcoal	1,400
(B. and L. give petroleum coke	1,125)
Electrodes	100
Power	0.8 horse-power year.

A small single-phase furnace of 300 kw. would turn out about 500 tons per annum, or 1½ tons per day, which would be as much as could be utilized locally.

The following estimate of the cost of 1 long ton of 80-per-cent. ferro-manganese is based on information supplied by Messrs. Beckman and Linden:—

Manganese ore, 4,700 lb. at $25 per net ton	$ 58 80
Steel turnings, 300 lb. at $10 per gross ton	1 30
Lime rock, 1,040 lb. at $3.50 per net ton	1 80
Coke and charcoal, 1,400 lb. at $8 per net ton	5 60
Electrodes, 100 lb. at 7 cents per pound	7 00
Power, 0.8 horse-power year at $15 per horse-power year	12 00
Labour	8 00
Maintenance	5 00
Supplies	1 50
Plant, general expense	3 00
Office, general expense	6 00
Total	$110 00

R. M. Keeney states that the power-consumption varies from 4,000 kilowatt-hours per long ton in a 3,000-kw. furnace to 7,000 kilowatt-hours per long ton in a 1,000-kw. furnace, which would correspond to 0.72 and 1.27 horse-power years respectively at 85 per cent. load factor. He also states that the electrode-consumption is high, ranging from 150 to 250 lb. per long ton of the product when using amorphous carbon electrodes. These results were obtained when smelting ores of about 39 per cent. of manganese, and with a consumption of about 1,300 lb. of "coal" per gross ton of product, and about 3 net tons of the 39-per-cent. ore; the recovery being about 75 per cent.

From other sources I learn that the regular practice in a ferro-alloy furnace of 1,500-kw. over a considerable period has been as follows per gross ton of 80-per-cent. ferro-manganese:—

2.5 net tons of 40-per-cent. ore, costing 80 cents per unit.
720 lb. coke at $5 per net ton.
720 lb. charcoal at $20 per net ton.
65 lb. graphite electrodes at 12 cents per pound.
0.66 to 0.85 horse-power year of 85 per cent. load factor.

The ores available in British Columbia appear from the foregoing reports to contain about 40 per cent. manganese, and comparing the various figures given above, I conclude that in a 300-kw. furnace 1 long ton of 80-per-cent. ferro would need about the following:—

40-per-cent. manganese ore, 2.7 net tons.
Coke and charcoal, 1,400 lb.
Electric power of 85 per cent. load factor, 0.9 horse-power year.
Carbon electrodes, 150 lb.
Lime rock, 1,500 lb.
Steel turnings, 300 lb.

An estimate of the cost of 1 long ton of 80-per-cent. ferro-manganese based on these figures would be as follows:—

Cost of making One Long Ton of 80-per-cent. Ferro-manganese with $15 Power in a 300-kw. Furnace.

40-per-cent. manganese ore, 2.7 net tons at $25	$ 67 50
Steel turnings, 300 lb. at $10 per gross ton	1 30
Lime rock, 1,500 lb. at $3 per net ton	2 25
Coke and charcoal, 1,400 lb. at $8 per net ton	5 60
Electrodes, 150 lb. at 7 cents per pound	10 50
Electric power, 0.9 horse-power year at $15	13 50
Labour	8 00
Maintenance	5 00
Supplies	2 00
Plant, general expense	3 00
Office, general expense	6 00
Total	$124 65

If the power were to cost 0.5 cent per kilowatt-hour, the charge for this item would be:—

0.9 horse-power year (0.85 L.F.) at $27.70	$ 25 00
And the final figure for the cost	136 15

Silico-manganese.

In steel-making it is usually necessary to add ferro-manganese and ferro-silicon to obtain a sound product. As manganese ores usually carry a considerable amount of silica, it is economical to reduce this to silicon instead of slagging it off with lime: thus obtaining a "silico-spiegel" containing both manganese and silicon. The following estimate, based on information from Messrs. Beckman and Linden, gives the cost of a long ton of silico-spiegel containing 18 per cent. silicon, 40 per cent. manganese, and 3 per cent. carbon. The ore contains 42 per cent. manganese and costs $23 per net ton.

Cost of making One Long Ton of Silico-spiegel with $15 Power in a Large Furnace.

Manganese ore, 2,140 lb. at $23 per net ton	$24 60
Silica rock, 400 lb. at $4 per net ton	80
Coke and charcoal, 1,200 lb. at $8 per net ton	4 80
Steel turnings, 950 lb. at $11 per gross ton	5 00
Power, 0.8 horse-power year at $15	12 00
Electrodes, 60 lb. at 7 cents per pound	4 20
Labour	8 00
Maintenance	3 00
Plant, general expense	6 00
Office, general expense	4 00
Total	$72 40

I have no figures available to compare with this, but increasing it proportionally with that for ferro-manganese, on account of the small size of the furnace, would give a total of about $85 per ton with $15 power, or $95 per ton with 0.5-cent power.

A higher-grade alloy might have the following composition:—

	Per Cent.
Manganese	59
Silicon	20
Iron	17
Aluminium	3
Carbon	1

The following is the estimated cost of making 1 long ton of this alloy, based on Beckman and Linden's figures:—

Cost of making One Long Ton of High-grade Silico-manganese with $15 Power in Large Furnace.

Manganese ore, 3,200 lb. at $25 per net ton	$40 00
Steel turnings, 440 lb. at $10 per gross ton	2 00
Silica rock, 380 lb. at $4 per net ton	80
Coke and charcoal, 1,800 lb. at $8 per net ton	7 20
Electrodes, 100 lb. at 7 cents per pound	7 00
Power, 0.8 horse-power year at $15	12 00
Labour	8 00
Maintenance	5 00
Supplies	1 50
Plant, general expense	3 00
Office, general expense	6 00
Total	$92 50

Increasing this total to correspond with the use of a small furnace, we get with $15 power about *$100* per ton, and with 0.5-cent power about *$110* per ton.

FERRO-CHROMIUM.

The following estimate, based on the figures of Beckman and Linden, is for the production of an alloy of the following composition:—

	Per Cent.
Chromium	65
Iron	28
Carbon	5
Silicon	1

The ore is assumed to contain:—

	Per Cent.
Chromium	31 (Cr_2O_3, 45 per cent.)
Iron	12
Silica	12
Magnesia	16

Cost of making One Long Ton of Ferro-chromium with $15 Power in Large Furnace.

Chrome ore, 4,750 lb. at $36 per net ton	$ 85 50
Steel turnings, 100 lb. at $11 per gross ton	50
Coke and charcoal, 1,200 lb. at $8 per net ton	4 80
Power, 1.2 horse-power years (0.85 L.F.) at $15	18 00
Electrodes, 100 lb. at 7 cents per pound	7 00
Labour	12 00
Maintenance	3 00
Supplies	2 00
Plant, general expense	10 00
Office, general expense	6 00
Total	$150 80

In a recent paper (September, 1918) R. M. Keeney discusses very fully the production of ferro-chromium, and the following notes are based on his paper: Ferro-chromium can be made of varying carbon contents, usually between 4 and 8 per cent. If chrome ores are smelted with an abundance of carbon, the recovery of chromium is good, being 90 or 95 per cent. of the amount in the ore, but the ferro will contain about 8 per cent. of carbon. If, on the other hand, the supply of carbon is restricted so as to keep the carbon below 6 per cent., the recovery of the chromium will be poor, about 70 or 75 per cent. The recovery depends partly on the richness of the ore, and when this is below 40 per cent. Cr_2O_3, the recovery is low.

American ores from California and Oregon are reported to contain as a rule from 40 to 45 per cent. Cr_2O_3. The ores from Scotty creek, in British Columbia, appear to have in some cases 40 per cent. of Cr_2O_3, and therefore to be rather poorer than the American ores. In making 65-per-cent. ferro-chrome there would be needed per long ton of the product:—

For an 8-per-cent. carbon product at 90-per-cent. recovery.....5,730 lb. of ore.
For a 5-per-cent. carbon product at 70-per-cent. recovery.....7,380 lb. of ore.

The power figures of Beckman and Linden are based on the statement that each pound of ferro-chromium needs 3 kilowatt-hours for its production. This may be correct with high-grade ores and in large furnaces. In Keeney's experiments, using furnaces of about 200 kw., the power-consumption was about 3.4 or 3.5 kilowatt-hours per pound, and this at 85 per cent. load factor corresponds to 1.4 horse-power years.

Beckman and Linden in their original estimate state that 1,100 lb. of petroleum coke would be needed per long ton of the product, and I converted this into 1,200 lb. of coke and charcoal. Keeney used coke in his experiments, and the amount varied from 0.5 to 0.75 lb. per pound of ferro. Taking 0.6 lb. as a mean value, we find the consumption to be 1,344 lb. per long ton of the product.

For the production of ferro-chromium in a small furnace of 300 kw. it will be safer to take the more conservative figures of Keeney, and using, as before, the remaining items from Beckman and Linden, which I have already increased a little on account of the smaller scale of operation, we obtain the following estimate:—

Cost of Production of One Long Ton of 65-per-cent. Ferro-chromium with about 6 per Cent. Carbon from an Ore of 40 per Cent. Cr_2O_3 in a Furnace of 300 Kw.

Chrome ore, 6,000 lb. at $36 per net ton	$108 00
Steel turnings, 100 lb. at $11 per gross ton	50
Coke, 1,350 lb. at $8 per net ton	5 40
Power, 1.4 horse-power years at $15 per horse-power year	21 00
Electrodes, 100 lb. at 7 cents per pound	7 00
Labour	12 00
Maintenance	5 00
Supplies	2 00
Plant, general expense	10 00
Office, general expense	6 00
Total	$176 90

If the power cost 0.5 cent per kilowatt-hour, the charge for this item would be:—

7,700 kilowatt-hours at 0.5 cent	$ 38 50
And the final cost per ton of ferro would be	194 40

Ferro-silicon.

The following estimate is given by Messrs. Beckman and Linden for the cost of making 1 ton of the 50-per-cent. ferro-silicon. The output of a 300-kw. single-phase furnace would be 400 tons per annum, or 1 ton daily.

Cost of making One Ton of 50-per-cent. Ferro-silicon with $15 Power in a Large Furnace.

Power, 1 horse-power year at $15	$15 00
Quartz, 2,400 lb. at $3.50 per net ton	4 20
Coke, 1,200 lb. at $8 per net ton	4 80
Turnings, 1,500 lb. at $10 per net ton	7 50
Electrodes, 60 lb. at 7 cents per pound	4 20
Labour	16 00
Supplies	1 50
Plant and office, general expense	5 00
Interest and depreciation, 20 per cent.	10 00
Total	$68 20

If power were to cost 0.5 cent per kilowatt-hour, the power item would be $27.80, and the whole cost $81.

Prices of Ferro-alloys.

For comparison with the figures of costs given above, I add the present and the pre-war prices of some ferro-alloys.

Ferro-manganese.—Before the war (December, 1913) the 80-per-cent. alloy sold at about $50 per long ton in the Eastern States. Its present price (October, 1918) is $250 for the 70-per-cent. alloy, with a charge of $3.50 per unit from that basis; thus the 80-per-cent. alloy would bring $285 per ton, which is nearly six times its price before the war. Before the war a spiegel (low-grade ferro-manganese) containing 20 per cent. of manganese was worth $25 a ton; at present a 16-per-cent. spiegel is worth $75 a ton, and a 20-per-cent. spiegel would be worth about $90 a ton.

The price of ferro-manganese in British Columbia must be about $20 a ton higher than the above figures, so that if 80-per-cent. ferro-manganese could be made at $150 a ton there would be a very good profit at present prices. On the other hand, the business would be impossible if prices were to return to their original level, unless in the meantime very important economies could be effected in the cost of supplies and other operating expenses.

Ferro-silicon.—Before the war (December, 1913) the price of 50-per-cent. ferro-silicon was $73 a ton, the 10-per-cent. alloy was $21, the 11-per-cent. alloy was $22, and the 12-per-cent. alloy $23. At the present (October, 1918) 50-per-cent. ferro-silicon is quoted at $160 per ton, the 9-per-cent. alloy is $55, the 10-per-cent. alloy is $57, and the 11-per-cent. alloy is $60 a ton. If the 50-per-cent. alloy can be made in British Columbia at anything like the estimated cost of $70 per ton, its manufacture should afford a good profit at present prices, and with reasonable economies should remain profitable even when prices have fallen considerably.

It will be remembered, of course, that the present market for these alloys in British Columbia is very limited, being less than a ton of each alloy daily. One reason for making ferro-alloys will be to supply them to the steel-making department of the plant, which otherwise would have to buy these alloys at excessive prices, and as the steel industry develops the outside market for the alloys will increase.

The design and cost of the plant and furnaces for making ferro-alloys have been considered in other parts of this report.

STEEL-MAKING.

In order to be able to make pig-iron on as large a scale as possible, and also with a view to combining more profitable industries with that of iron-smelting, it is desirable to introduce into the electric-smelting plant furnaces and other appliances for making steel. The general scheme suggested is that about 25 tons of foundry iron should be produced daily for sale to iron-foundries, and a further 25 or 30 tons of white pig-iron should be made for conversion into steel in the same plant or elsewhere. The steel would probably be made in small open-hearth furnaces heated by oil, or in electric furnaces of the Heroult type. Together with 30 tons of pig-iron, about 60 tons of steel scrap could be used if desirable, thus yielding about 85 tons of steel daily. This could be used in part for making steel castings, and the remainder could be rolled into rods and bars of small section in a small rolling-mill. The manufacture and the use of steel are too well known to require any discussion in this report, and it would be impossible for me to treat the subject adequately in the space and time at my disposal. A rough estimate of the cost of a steel plant has been given in Appendix IX., and I may add the following estimate, made by Lyon and Keeney in 1915, for the cost of electric steel-making in the Western States (Trans. Amer. Electrochem. Soc., 1915, XXVIII., page 158) :—

Cost of Production of One Long Ton of Steel in the Electric Furnace in the Western States.

1.1 tons of scrap at $15 per ton	$16 50
Slag materials	1 00
Ferro-alloys	1 00
800 kilowatt-hours at 0.20 cents	1 60
Labour	2 50
Maintenance and repairs	2 40
20 lb. of electrodes at 5 cents	1 00
Amortization and depreciation at 5 per cent. each	1 50
Interest at 6 per cent.	90
General	1 00
Royalty	50
Total	$29 90

The present cost of making steel in British Columbia will be considerably higher than this estimate, on account of the higher cost of supplies and operation.

The present price (October, 1918) of steel billets in the Eastern States is about $50 per gross ton, which might correspond with about $70 in British Columbia. The price in December, 1913, was $20 to $22 in the Eastern States. There would, however, be no attempt, under normal conditions, to compete with heavy structural material, and there are many purposes for which steel can be made at a profit, under present conditions in British Columbia, even in electric furnaces using power at 0.5 cent per kilowatt-hour.

PROVINCE OF BRITISH COLUMBIA

DEPARTMENT OF LANDS

REPORT ON THE SUBDIVISION OF CERTAIN LANDS FOR RETURNED SOLDIER SETTLEMENT

NEAR FORT ST. JAMES, STUART LAKE, COAST DISTRICT RANGE FIVE

By

J. H. GRAY, B.C.L.S.

PRINTED BY
AUTHORITY OF THE LEGISLATIVE ASSEMBLY.

VICTORIA, B.C.:
Printed by WILLIAM H. CULLIN, Printer to the King's Most Excellent Majesty,
1919.

FOREWORD.

By Order in Council dated August 9th, 1918, certain lands in the Stuart Lake and Stuart River Valleys were reserved for soldier-settlement purposes. A large amount of the land included in this reserve was formerly held under applications to purchase and surveyed as such into blocks of 640 acres each. During the summer of 1918 Mr. J. H. Gray, B.C.L.S., was employed in charge of a party on the subdivision of these lots into areas of approximately 160 acres each.

The following is Mr. Gray's general report on the area covered by this work.

T. D. PATTULLO,

Minister of Lands.

Victoria, B.C.,
January, 1919.

Report on the Subdivision of certain Lands for Returned Soldier Settlement near Fort St. James, Stuart Lake, Range 5, Coast District.

Situation and Extent.

The tract subdivided this season and examined in detail consists in all of 61,359 acres situated upon either side of Stuart River, directly south and east of Fort St. James, at east end of Stuart Lake.

Three Groups.

This entire area, on account of location and physical variety has been divided into three groups—viz., A, B, and C—to which reference shall be made.

Group A.—This group comprises forty-six originally surveyed lots or parcels of land, aggregating 22,917 acres, situated on the west or right bank of the Stuart River, directly south of Stuart Lake, having a river-frontage of nearly ten miles, with a general depth, southerly, of five miles.

Group B.—Group B comprises fifty-two original lots, aggregating 28,539 acres, occupying an area some seven miles square, north and east of Fort St. James, at the east end of Stuart Lake.

Group C.—Group C includes fifteen original lots, containing 9,220 acres, lying to the south-east of Fort St. James, in the valley of Necoslie River, which flows north-westerly into Stuart River, where the latter leaves that lake.

Total Area of Subdivision, 61,389 Acres.

Relative Situation and Sketch-plan (A, Yellow; B, Green; C, Red).—These three groups, aggregating 61,389 acres, are distinctively coloured yellow, green, and red upon the small-scale map accompanying this report, and through which their relative positions and separating causes may be ascertained.

Group A.

Comparison with other Groups.—Group A (22,917 acres) of the land so far subdivided includes more generally and to a greater extent than the other two groups areas possessing the requisite and attractive conditions inviting to settlement—viz., the best of soil, light clearing, with a percentage of open land, regular surface, and, with the exceptions noted, good water-supply; moreover, a fairly good wagon-road connection already established with railway communication.

Classification.—The total, 22,917 acres, contained on Group A has been divided as follows:—

	Acres.
First-class land	19,377
Second-class land	2,080
Third-class land	960
Muskeg land	500

The land on the area specified "first-class" consists of a light and dark chocolate-coloured loam, extremely consistent as to grade, irrespective of tree-growth, throughout the whole tract.

First-class Lands, 19,377 Acres.—This soil is very fine in texture, thereby containing capillary moisture to a maximum extent. In August last it was necessary to only kick up an inch or so of soil to find dampness.

It would appear that the soil deepens in colour and possibly becomes more "clayey" upon the Stuart bank, but at no point were found churnings or lumps, resulting from vehicular traffic that might not be easily pulverized in one hand.

This land is entirely free from stones or rock, and excepting the steep sides of the trough of Todd Creek, about 60 feet deep, and a few lateral gullies, there is nothing to prevent, but the standing timber, the whole area from being ploughed.

The overlying leaf-mould or humus varies from 2 inches to ½ inch in depth, dependent upon tree-growth. Poplar creates the greatest thickness, decreasing to but a thin covering where solely evergreen timber prevails. In the same way the natural covering of wild grasses, vetches, and berry-bushes, for the most part luxuriant amongst poplar, diminishes in extent in proportion to the greater or sole evergreen growth, but, as before stated, the excellent character of the land or soil remains unchanged.

Second-class Land, 2,080 Acres.—Under the heading of "Second-class Land" is soil generally a lighter quality of loam, intermixed with a varying percentage of gravel and boulders, the latter on the higher elevations or tops of local ridges. These areas, although cultivable, would not at the present time be sought, nor attract attention, except as possible cattle-runs, whenever the more attractive areas become "fenced in."

This indifferent land is found on the westerly boundary of group, from Lot 1646 south to Lot 1605.

Third-class Land.—The third-class area (960 acres) may be eliminated entirely from any sphere of utility, beyond a possible supply of building-timber. Otherwise this is an area of useless land, occupying practically the whole of Lot 1648 and centre of Lot 1649.

Merchantable timber comprising fir, spruce, and pine is found here; the whole aggregating a supply of some 7,000,000 feet, which, although possibly a useful adjunct to near-by settlement, could not compare with other sources of similar supply, approximate generally to the settlement area.

Muskegs are scattered.—An area of 500 acres of this class of land is to be found in Group A, about 70 per cent. of which is open. Pending more data as to the feasibility and cost of drainage, these have been classed as "lost lands" at the present time.

Unlike other classifications, muskeg is by no means isolated, but occurs at various intervals ranging in extent from 2 to 40 acres. Their position and extent in relation to each quarter-section may be learned from the detail reports.

CLEARING, GROUP A—FIRST-CLASS LAND, $21 PER ACRE (AVERAGE COST).

The following remarks in respect to clearing relates to the area of first-class land only, some 19,377 acres.

An attempt has been made to estimate the cost of preparing the surface for rough-ploughing in the various degrees of tree-growth. This cost ranges from the minimum in open poplar through changing percentages of this timber with spruce and pine and willow, to a maximum in sole evergreen growth.

Useful Timber eliminated.—In the figures of estimated clearing cost of the first-class land area there has been eliminated some groves of "building" spruce and pine, having a diameter of from 12 to 14 inches and aggregating about 500 acres in extent.

This has been done in the belief that the value of such timber is greater than the cost of removal, which removal under ordinary circumstances would be brought about only by degrees, as requisitioned for useful purposes. The enclosure of this class of timber under the head of ordinary clearing, where the material to be removed is valueless except possibly for fencing, would tend to mislead.

Clearing Cost under $21 per Acre.—It has been adjudged that with this elimination the maximum cost of ordinary clearing would not exceed $30 per acre, nor again cost less than $10, and hence is estimated the following:—

1,000	acres costing	$30 00
6,641	acres costing	25 00
6,368	acres costing	20 00
4,151	acres costing	15 00
717	acres costing	10 00
18,887	acres averaging	$20 81 per ac.

Relating to the above figures, I beg to repeat here what was written in my sub-report of August 18th last:—

"Before concluding, a word on the subject of clearing cost. In body of report are quoted figures of cost in relation to various localities.

"I recognize the risk in stating a price, especially in the absence of any practical experience. It might be explained, however, that what has been quoted is an endeavour to

obtain an average rate over the whole parcel dealt with, unless otherwise specified. This would greatly vary in accordance with the manner in which the work was executed. I have tried to base my estimate of cost upon operations as usually followed by the ordinary settler—viz., of cleaning up the open and easier patches of land at his disposal and permit time to work upon his heavier woods (supposedly already slashed or killed).

"Should it be determined to clean up, say 50 square acres forthwith, the cost would certainly exceed my figures. Again, if 'straight-ahead' clearing were to be organized and prosecuted upon a community and large scale, I am of the opinion that they would be largely reduced."

There shall be found many quarter-sections in which, by following the stretches of more or less expansive open land or light tree-growth, it would be possible to clean up acreage under the minimum cost stated, and in many cases practically without.

NATURAL WATER-SUPPLY.

Owing to the low altitude of the flanking ridge on the south (the watershed between this and the Nechako Valley), streams are infrequent, the water-supply here being confined practically to Todd Creek, which, after receiving Rabbit Creek, its principal feeder, some two miles within the tract, flows northerly, parallel to the Stuart River, *but in the opposite direction*, in a trough some 60 feet deep.

Numerous small lakes or ponds are scattered about; these, however, could not be counted upon to contribute potable water-supply during the summer months.

The Stuart River bounds the tract on the east, providing a bountiful water-supply of excellent quality (although not always convenient) to the areas adjacent.

PERCENTAGE OF DRY QUARTER-SECTIONS.

The distribution of the natural water-supply, as is usually the case, is inadequate to meet the general demands of the entire settlement area.

The first-class land as at present subdivided is composed of quarter-sections or parcels of land to the number of 128. Of this number, seventy-two are without a natural supply of good water, or about 56 per cent., while on fifty-six subdivisions, or 44 per cent., a good water-supply was found.

WELLS.

What difficulties may be encountered in the sinking of wells is not known, since, owing to the absence of any settlement on this the west side of Stuart River, no undertaking of this description has been attempted. On the east or Fort St. James side wells have been sunk and water found at varying depths, from 20 to 40 feet.

An amelioration of this situation could, of course, be effected by varying the subdivision so as to distribute the existing supply to the greatest extent possible, since where found, principally Stuart River and Todd Creek, this essential is good and abundant. The lakes and ponds referred to would answer for stock.

TRANSPORTATION, GROUP A—30 MILES FROM RAILWAY.

The Government wagon-road from the Grand Trunk Pacific Railway at Vanderhoof to Fort St. James traverses the length of Group A, being practically twenty-five and thirty-five miles respectively from the former place and railway at its south and northerly boundaries. This road is used by automobiles in the summer and is a fairly good means of communication, subject to the usual disabilities attending country roads during change in seasons. Connection with the railway could be much reduced and still pass through a good line of country at its southerly end.

The crossing of the Stuart River to Fort St. James is at the present time by cable-ferry. A bridge just below the present ferry-site would be a simple affair.

SETTLEMENT SHOULD BE INAUGURATED IN GROUP A.

Group A, just described, constitutes the most favourable field in which to start settlement. The place within it at which a community point or headquarters should be established is on the present wagon-road at the point on west boundary of Lot 1551, where a bend in Todd Creek crosses and recrosses that line. This combines good water-supply with established line of

communication, besides being approximate to several sleigh-roads and trails which traverse this tract in various directions. It is central and some of the most attractive subdivisions in the group surround it.

Cattle and Winter Feed.—Since a small herd of cattle shall be an essential adjunct to the settlers' undertaking, the question of available winter feed, in the beginning at least, is of first importance. Wild hay meadows of any extent in Group A are held under Indian reserve, excepting that in Lot 1656, which lot is already Crown-granted.

The lack of hay meadows here could be effectually met by utilizing temporarily, upon a community basis, the areas of this description in Group B; also the acquisition of Lots 1654 and 1656 may be considered advisable on general grounds.

LUMBER—LOCAL PRICE $35 PER 1,000 FEET B.M.

Mill now operating.—A small mill is now established on the north shore of Stuart Lake, about six miles from Fort St. James. This turns out much more material than present needs require, and possibly there may be found cured lumber in stock. The present rate is $35 per 1,000 feet B.M.

Mill-site.—Should it be determined to augment this institution, there is a convenient and reverted Timber Limit 638P, Lot 4932, three miles from river-mouth on north shore of Stuart Lake, which would be available for a mill-site if water and a sheltered nook exists in which to place the plant. This shelter is requisite since this shore of the lake is exposed and shallow.

STUART LAKE MAIN TIMBER-SUPPLY.

Access to Stuart Lake.—The main timber-supply for not only Group A, but the entire settlement area as proposed, shall come from Stuart Lake, and there is no finer timber in the north than found on its shores. It would therefore seem desirable that access to the lake from within Group A should be secured.

Mouth of Stuart River Best Shelter.—Attention is directed to the alienated area lying to the north and east of Lot 1665, whereby this access would be effected, and what perhaps is of more importance, control over the sheltered waters within the mouth of Stuart River. This question, however, requires more research and expert decision.

GROUP B, 28,539 ACRES.

This group occupies a shallow valley stretching north-easterly from the south end of Stuart Lake for a long distance.

General Description.—The area subdivided includes not only all the good land which lies in a strip some eight miles in length, averaging three miles wide, but extends north and south from this strip up the slopes of the flanking ridges in second- and third-class areas.

Tree-growth.—Evergreen growth in spruce and pine is in greater percentage and heavier than in the lands hitherto described, resulting in greater clearing cost. Open or hay meadows are found to a greater extent, as are also *drainable* muskegs. The general altitude is also greater than in Group A.

Group B suitable for Stock-raising.—In a general way Group B is better adapted for stock-raising than any other of the lands reserved, and beyond the few choice locations in the neighbourhood of Stuart Lake it is likely to be sought for this purpose, combined with a minimum of mixed farming. The whole district lends itself to the production of fine stock, in which, besides the luxuriant natural feed, the presence of a maximum of lime in the water may have something to do.

It is a good horse country, in many instances these run out all winter, but this is not advantageous treatment. A safe estimate would be three and a half months feed for horses and five months for horned stock.

The limited experience so far as practised seems to demonstrate the breeding of local animals with imported bulls to be more successful than the importation of unacclimated beasts —the same with horses.

Classification.—The 28,539 acres contained in Group B have been divided as follows:—

	Acres.
First-class land	13,465
Second-class land	11,752
Third-class land	1,940
Muskeg land	1,382

First-class Land, 13,465 Acres.—The first-class or really good areas of Group B are composed of the same chocolate-coloured silt met with in Group A. There is by no means, however, the same depth of this soil, nor its widespread and consistent excellence. These remarks would not occur only in comparison with such an exceptionally good tract of land as is found in Group A.

In the matter of open land or hay meadows and water-distribution it is better served than either of the other two groups, while the eight sections nearest to Fort St. James offer to immediate settlement inducements quite as attractive.

Hay Meadows.—In the acreage stated for first-class land is included 400 acres of what may be termed wild hay meadow, from a proportion of which hay is now being taken.

It is to this area reference was made in speaking of "winter feed" for settlers in Group A. Where it occurs the covering growth is willow, the removal of which is not costly, so that preparation for even only the wild grasses and their (meadow's) enlargement would guarantee the economical wintering of so much more stock.

Second-class Land, 11,752 Acres.—Second-class land, 11,752 acres, of same character as already described, occurs as the slopes of the adjacent ridges lying north and south are ascended. Owing to the large percentage of evergreen growth, summer feed in places is scant, but at least one-half of this area would be excellent cattle-run.

Third-class Land, 1,940 Acres.—Third-class land, 1,940 acres. This area consists for the most part of rocky tops of the flanking hills, and beyond the (in many cases) good growth of milling-timber are of no value.

Muskeg, 1,382 Acres.—This area is practically contained in one locality, known as the "Grand Muskeg," occupying portions of Lots 4752-4751 and 4725, on the imperceptible height of land between the waters flowing westerly into the east end of Stuart Lake and those into Ocock River on the east, the waters of which, after first flowing into Pinchi Lake, also reach Stuart Lake farther to the north and west. This muskeg is considered "drainable" at reasonable cost, but estimating this cost would require such examination as has not been given.

Lime.—It might here be remarked that, relative to the reclamation and "sweetening" of any such land, the district abounds in limestone, from which an excellent article of lime has been produced, and should be economically procurable.

Clearing, Group B—First-class Land, $25 per Acre.

The clearing cost relates only to the area included under head of first-class lands—viz., 13,465 acres. This has been determined at the average rate of $25 per acre.

Areas near Fort St. James.—The area referred to as "nearest Fort St. James offering inducement to immediate settlement" might be placed somewhat lower, since quite open land is to be found at intervals.

Clearing Second-class Land.—Clearing second-class land is placed at $30 to $35 per acre, and would include a large percentage of good building spruce and pine.

Natural Water-supply, Group B.

A glance at the map indicates that many small streams, all providing a perennial supply of excellent water, flow down from the northerly ridge and meander through the length of the better lands.

Subdivision.—The first-class area, 13,465 acres, consists of eighty-seven quarter-sections or parcels of land.

Percentage of Wet and Dry Parcels.—Of these, fifty-one, or practically 60 per cent., have access to a natural water-supply, while thirty-six or 40 per cent., are without water.

Lakes.—The two lakes that occur in Group B both contain good water.

Wells.—No wells have been sunk in this locality; it is, however, thought that no difficulty will be found in getting water at reasonable depth.

Transportation—Principally Hay-roads.

As stated, a Government wagon-road connects Fort St. James with the Grand Trunk Pacific Railway at Vanderhoof, a distance of about thirty-eight miles. This same road extends another mile to the Roman Catholic Mission on Stuart Lake. From the "Mission" the Manson Creek (Government) Road is roughly constructed and runs northerly, as shown on accompanying sketch map, to the northern boundary of tract.

Another road (the old McLeod Lake Trail) starts at Fort St. James and traverses the southerly tier of good sections to the east boundary, and a branch road from this crosses north-easterly and traverses easterly to the same boundary the northerly tier of good lands, so that Group B is already fairly well equipped with lines of communication, such as they are.

These roads have been constructed partly by settlers and to a large degree by the Indians, their principal use being for haying operations (teams and wagons) in the late summer and hauling of hay from the stacks in the winter months, for both of which duties they answer fairly well; during change in seasons, however, they are impassable for wagons.

GROUP C, 9,220 ACRES.

That portion of Group C which was subdivided this season consists of a small portion at its north end of the reserved area lying in the valley of Necoslie Creek, and which may be said to be the inferior portion of this large and excellent tract of land. This inferiority relates particularly to those parcels lying on the southern slopes of the dividing ridge between this and Group B and to the north of the strip of pre-empted lands. It is in this locality that the second-class land noted below occurs. To the south of the pre-empted areas are excellent lands, quite ready for immediate *further* settlement.

A report will follow, made upon the subject of pre-emption improvements in this locality, in which it will be shown that these have been carried on to a considerable extent.

Classification.—Group C has been divided into two classes only, first- and second-class lands, viz.:—

	Acres.
First-class land	7,140
Second-class land	2,680

First-class Land.—The first-class land is of same composition as in Group A, and similar conditions as to depth and consistent grade prevail; generally speaking, however, the clearing is somewhat heavier.

Necoslie Water-flow.—The Necoslie River is a stream of dimension in flood, being from 75 to 100 feet wide and probably reaching a depth of 3 feet, which conditions are changed, however, in autumn to a small run of water forming pools between shallow ripples; abundant water, however, for all needs.

Necoslie Trough.—The stream itself is tortuous, winding across the intervening flats from foot to foot. These flats are open to a large extent, or except where covered with a light growth of poplar and willow. These locations offer opportunities for a small start with little preparation.

The foregoing remarks relate to the first ten miles of the stream, practically to the point where it traverses the north-east corner of the "allotted areas," beyond or to the south of which, through the reserved lands, the river flows closer to the surface of the adjacent ground.

Second-class Land, 2,680 Acres.—As stated, the second-class land, 2,680 acres, occupies almost entirely the northerly end of Group C, and not more than 60 per cent. of this area could be counted of much use for grazing purposes. The fine growth of timber found here, however, will be valuable.

Meadows and Muskegs.—The extent of this class of lands is negligible; that is to say, no extent of either is found in one place.

CLEARING, GROUP C—FIRST-CLASS LAND, $24 PER ACRE.

The tree-growth over Group C may be termed patchy, in so far that, although the mixed timber—poplar, spruce, and pine—prevails, all three are found in distinctly separate and unified groves, but, as in Group A, without change in the supporting soil. The cost of clearing the first-class land, 7,140 acres, has been estimated at $24 per acre, and this rate may be considered on the high side.

NATURAL WATER-SUPPLY, GROUP C.

Outside the Necoslie itself the water-supply is poor. Group C as subdivided consists of forty-five subdivisions, of which twenty-seven, or 60 per cent., are supplied with water, while on eighteen, or 40 per cent., no water was found.

Transportation, Group C—Poor.

An ill-made or simply "swamped-out" road over which teams may be taken in summer extends through the length of the pre-empted lands as shown. This road starts at Fort St. James and dwindles into a trail ten miles out.

Climate.

Judging from the experience of people who have lived in this locality, the climate is healthful and invigorating. The summers are not excessively hot and showers are frequent up to the middle of August; the autumn is usually dry. Extreme winters last five months; sometimes only four, November to March. Low thermometer is never accompanied with wind. Blizzards, as also floods and droughts, are unknown.

Very cold snaps (—30° to —40°) occur each winter; these vary, but are usually of short duration, or three days. The average winter thermometer is around zero.

Precipitation.—The Dominion Meteorological Department has a station at Fort St. James under the direction of Mr. O. W. Murrey. From this source the average rain and snow fall for the past twenty years has been determined as 15.35 water-inches per annum.

Elevation—Stuart Lake, 2,200 Feet above Sea.

The elevations relative to each other and to Stuart Lake were determined throughout the three groups. Obtaining this information was incorporated with other survey-work, so that contours could be available for a topographical plan. These results have not yet been deduced, but it may be stated that, taking Stuart Lake to be 2,200 feet above the sea-level, the first-class land will be found to lie approximately as follows:—

Group A	2,200 to 2,430 feet above sea-level.
Group B.	2,250 to 2,500 feet above sea-level.
Group C	2,175 to 2,300 feet above sea-level.

Work of Survey.

It is not proposed to more than touch upon this subject at the present time, since the data obtained has not been fully made up, but to delay that report until such time as full returns shall have been completed.

Employees.—Two surveying parties were engaged; two surveyors and one assistant with eight returned soldiers and a cook left from Victoria in July last. This force was augmented on the ground, as the purposes of the work demanded, by engaging Indians and later another returned man.

Standard of Old Surveying-work.—The standard of the previous surveying applied to the original sectional subdivision was found to be excellent. The limit of error established for the subdivision survey having in no case been approached—in fact, excepting in the case of a few intersections, the joining error or difference, both in the cross-chaining and distance off old post, was negligible. The markings on old posts were scrutinized. In one case only was a correction made.

A detail report upon this and other matters pertaining to and resulting from the conduct of the work will be submitted.

Soil Samples.

Some twenty-four samples of soil were obtained from different points over the three groups. These samples were boxed to be forwarded the week after my departure from Fort St. James, but this has not been done. Word was received some ten days ago that they had been traced and were on their way. These with diagrams will be submitted whenever received.

Total Lands reserved, One-half subdivided.

Area of Reserved Lands not subdivided.—The area subdivided is about one-half that covered by the instructions, which governed the work last season. The remaining area contains all the lands on east side of Stuart River, back to and across the Necoslie River, practically to its head. Speaking from a knowledge of this tract, it may be said it will be found to compare favourably, for the most part, with Group A.

In this connection it might be remarked at the present time that in the matter of transportation it should not be overlooked that the Stuart River offers an excellent and alternative line of communication direct with the Grand Trunk Pacific Railway, not only passing through these unsubdivided areas to the south-east, but as a probably more economical means of handling freight in the summer months to Groups A, B, and C.

Distance by Stuart River to G.T.P. Rly.—The distance by river from the present Stuart River ferry to the railway is sixty-seven miles, forty-two of which is good water. The lower river is swift, one rapid, and has been improved for navigation by the Dominion Government. There is no impediment that boats up to 25 tons, properly equipped, could not successfully and regularly negotiate during six months in the year.

Cross-road from Lot 2785 to Railway.—An excellent "cross-country" line for wagon-road connection with the railway (G.T.P.) exists from a point on west bank of Stuart River in Lots 2785 or 2786. Such a road would reach the railway at Vanderhoof in thirteen or fourteen miles, and strike the lower reserved lands at a half-way point on Stuart River, with an excellent slow-flowing stream on either side (up and down river), besides tapping to the east a natural ascending grade to the back lands.

EXPERT REPORT ON STUART RIVER VALLEY.

The following synopsis, in part, of a report based upon screenings and analyses of soil samples, made a few years ago by a land expert, Mr. Woods, as emphasizing the merits of this tract of country as a favourable field for settlement, may be interesting. He says in his report:—

"*Area.*—102,000 acres.

"*Location.*—In Central British Columbia, near the Grand Trunk Pacific Railway, at the foot of Stuart Lake and along the Stuart River for about forty miles.

"*Stuart Lake Basin.*—An old glacial lake, probably 200 miles long, with numerous arms and variable width—probably 100 to 200 feet deeper than the present lake and containing numerous islands which are now hills.

"*Now partly drained* down to the present lake, the 'pot-holes' of the old glacial lake.

"*The Silt Area.*—All the space between the present lake-rim and the old basin-rim.

"*The Lake-bed Soils.*—The humus: 1 to 3 inches of black vegetable mould.

"The 'white silt': 1 to 3 inches of volcanic dust.

"The 'chocolate loam': 4 to 12 feet of volcanic dust, formed as lake sediment in successive layers from 2 to 12 inches thick, with marine grass-roots and a large content of organic matter in each layer.

"The 'deep silt': A great deposit of fine volcanic dust underlying the chocolate loam to an unknown depth, but observed in the cut-banks of the river to a depth of 60 and 80 feet.

"'The finer the richer': The rule for all soils. (Fletcher on 'Soils,' page 25.)

"Silt and clay particles: These constitute the richness and durability of all soils.

"*Percentages of Silt and Clay in Different Soils.*—(8,671 samples analysed by United States Department of Agriculture from United States soils.) Of the many given, three highest are quoted:—

	Per Cent.
Clay soils	78
Silt loams	80
Silty clay loams	86

"*Stuart Lake Soils analysed*—

Stuart Lake and River 'white silt'	86.3
Stuart Lake and River 'chocolate loam'	86.8

"They are easy to work, are mellow when ploughed, and can be ploughed at any time.

"*Organic Matter in Various Soils.*—Of the many percentages given in Mr. Woods's report, a few of the higher and the highest are quoted here:—

	Per Cent.
Average soils, the average of many	2.30
North-eastern States (highest for average soils)	3.73
Average for rich silt soils	5.30
Yasoo bottom silt (Miss.)	7.37
Putah Valley dark loam (Cal.)	7.12
Arroyo Grande Valley dark loam (Cal.)	6.23

"The Yasoo bottom and the Arroyo Grande soils, mentioned above, are considered to be among the 'richest known soils.'

"*Organic Matter in Stuart Lake and River Soils*—

	Per Cent.
Stuart Lake and River 'white silt'	6.59
Stuart Lake and River 'chocolate loam'	6.72

"NOTE.—All of the above samples for organic matter undoubtedly include a portion of the top humus soil, except the samples of the Stuart Lake and River soils, which do not include any of the humus."

Speaking at length in respect to plant-foods and nitrogen especially, the report sums up:—

"With a top humus and over 6 per cent. of organic matter in its main soil and subsoil bodies, the Stuart Lake and River sediments are sure of surplus nitrogen-supply for an indefinite period."

On the question of moisture Mr. Woods has to say:—

"When at any time the amount of rainfall entering a soil becomes greater than the water-holding capacity of the soil, losses by percolation will result. The bad effects of excessive percolation are twofold: (1) The actual loss of water; and (2) the leaching-out of salts that may function as plant-food. The quantity of nutrient elements lost annually from the average soil in a humid region more than equals that withdrawn by the crops.

"*Unsurpassed Qualities of the Stuart Lake and River Sediment Soils.*—First: The finest texture couples with easy tillage.

"Second: A large excess in mineral plant-foods, as shown by all the analyses of silt soils.

"Third: An organic content in excess of the richest silt soils and far in excess of average soils. No other soils known to the writer or mentioned in the many soil authorities consulted so fully combines *richness, durability, and mellowness for easy working* and for the *conservation of moisture.*

"This could only occur, as in this case, where a wind-carried volcanic dust has been deposited in water and remained undisturbed under water until it accumulated a large organic content. Water-carried soils (alluvial soils) cannot preserve all of these qualities.

"In a word, these lake-bed sediments take the highest rank for fineness and durability, for ease of working, and for range of crop and capacity.

"*Conservation of Moisture and Soil Strength.*—The smallness of the rainfall at Stuart Lake and River (15.35 inches) is more apparent than real. The snow melts in March and April, about 13 inches enter the ground from March 1st to September 1st, during the period of growth and maturity, *and it is all utilized.* There is practically no 'run-off' and no sinking beyond the reach of crops. The soil is porous enough to let it soak in, but fine enough to hold it by capillary force, without its sinking away as in sandy soils. Further, there is no leaching or flooding away of plant-food elements. Heavy rainfall hinders agriculture and wears out the soil by washing out its values.

"'Enough but not much' describes the Stuart Lake and River precipitation.

"In 'Soils,' by Lyon Fippin & Buckman, page 271, it is stated that of a 28-inch rainfall, one-half runs off, one-fourth evaporates, and one-fourth is used by the crop.

"*Clearing Land.*—Timber of fence-pole size; slashing and burning (by hand), $5 to $12 per acre; grubbing, $5 to $10 per acre. Eighty per cent. of the land could be cleared, grubbed, and ploughed in a single operation by a simple machine of proper size at less than $5 per acre."

All of which is respectfully submitted.

J. H. GRAY, M.E.I.C., B.C.L.S.

RETURN

Of Correspondence between Hon. John Oliver and Rt. Hon. Sir R. L. Borden, Prime Minister of Canada, and other Members of the Provincial and Federal Governments, touching the Matter of a Conference of Provincial Premiers and Members of the Dominion Government held at Ottawa, November 19th to 23rd, 1918.

JOHN OLIVER,
Premier.

Premier's Office,
31st January, 1919.

TELEGRAM FROM HON. JOHN OLIVER TO RT. HON. SIR ROBERT L. BORDEN.

VICTORIA, B.C., September 27th, 1918.

Right Hon. Sir Robert Borden,
Ottawa.

B.C. Government strongly are of opinion that a round-table Conference of Provincial and Dominion Premiers necessary to formulate plans for concerted action in respect to caring for returned and returning Canadian Military Forces and their dependents.

JOHN OLIVER.

TELEGRAMS FROM RT. HON. SIR ROBERT L. BORDEN TO HON. JOHN OLIVER.

OTTAWA, ONT., October 21st, 1918.

Hon. John Oliver,
Premier, Victoria.

Your telegram 27th September has just reached me. I hope to arrange for a Conference before 15th November, at which matters you mention can be taken up.

R. L. BORDEN.

OTTAWA, ONT., October 25th, 1918.

Hon. John Oliver,
Premier, Victoria.

On account of Federal loan campaign it is thought inadvisable to call the proposed Conference of Provincial Premiers before Tuesday, nineteenth November, and it has been summoned for that date. We trust that this slight postponement will not occasion any inconvenience. In view of several important subjects requiring consideration, we have decided to summon the Premiers of all the Provinces for the date mentioned, and formal notice goes out to-day.

R. L. BORDEN.

OTTAWA, ONT., October 26th, 1918.

Hon. John Oliver,
Victoria, B.C.

"It is the desire of the Dominion Government to have a Conference with the Provincial Premiers in Ottawa, commencing on Tuesday, November 19th, for the purpose of considering

the problem of soldiers' settlement, the general problem of land settlement, and the request of the Prairie Provinces for the transfer to them of their natural resources. Other subjects for discussion may be proposed. We earnestly request your attendance; Conference should not occupy more than three or four days.

R. L. BORDEN.

MEMO. FOR CONSIDERATION OF CONFERENCE OF DOMINION AND PROVINCIAL GOVERNMENTS.
Held at the City of Ottawa, November 19th, 1918.
(Submitted by Hon. John Oliver and Hon. T. D. Pattullo.)

Hon. Frank Carvell,
Chairman.

DEAR SIR,—When the Government of British Columbia received the telegram of the Hon. Sir. Robert Borden, Prime Minister of Canada, extending an invitation to attend this Conference, it was under the impression that any and all subjects which might suggest themselves to the Conference would properly be subject of discussion by the Conference.

Upon the opening of the Conference, practically the first question which urged itself upon the attention of the Conference was the question of the transference to the Prairie Provinces of the unalienated natural resources of those Provinces, which question, it was stated by representatives of the Federal Government, was specifically a matter for the consideration of the Conference.

To the representatives of British Columbia it was clear that the claims of British Columbia for the return of lands formerly conveyed by the Province of British Columbia to the Dominion in aid of the construction of railways, while much the same in principle as the claims of the Prairie Provinces, were of an even stronger character, and a request was made to the Conference that the claims of British Columbia should be considered.

To our surprise it was clearly stated by representatives of the Dominion Government, that, as British Columbia's claim was not specifically upon the list of subjects prepared by the Dominion for consideration by the Conference, therefore the said claim could not be considered at this Conference. This position, however, was modified, and the statement made that if the Conference so desired the case of British Columbia could be considered. Thereupon the Conference did indicate its desire that the claim of British Columbia should be considered.

After some discussion the suggestion by representatives of the Dominion Government, that the representatives of the Provinces should meet apart from the representatives of the Dominion for the purpose of arriving, if possible, at some conclusion which they would be prepared to recommend to the Dominion for acceptance, was acted upon.

During the deliberation of the Provincial representatives the claim of British Columbia was discussed as fully and as freely as were the claims of the Prairie Provinces, and, as far as we could judge from the tenor of the discussion which took place, the claim of British Columbia was favourably considered by the Provincial representatives. Certainly, so far as we are aware, no objections were made to the validity of British Columbia's claim.

As we understood the situation, the claims of all four of the Western Provinces were acceptable to the Provincial representatives. A difference of opinion arose amongst the Provincial representatives as to whether the granting of the claims of the Prairie Provinces would, or would not, entitle the Eastern Provinces to an increased subsidy allowance.

The position of British Columbia on this question is that if the granting of the claims of the Western Provinces creates or causes an inequity of treatment as between any of the Provinces, then the amount of such inequity should be ascertained and adjusted by the Dominion Government.

We were very much discouraged when, upon attempting to place British Columbia's position before the general Conference, the Hon. the Minister of the Interior again raised the objection that, as British Columbia's claim was not upon the list of subjects prepared by the Dominion for consideration, therefore the said claim could not be considered. Should the position taken by the Honourable the Minister of the Interior be upheld by this Conference, we shall certainly feel that we have been very unfairly treated.

We believe that it is the desire of this Conference that the claim of British Columbia be dealt with upon its merits, and at the same time as the claims of the Prairie Provinces are dealt with, and we so request.

If the Dominion Government is not already satisfied of the right and justice of the claim of British Columbia, we hope that we may be given the opportunity to support our claim by reason and evidence much more fully than has been possible during the deliberations of this Conference.

Respectfully submitted.

(Sgd.) JOHN OLIVER,
Prime Minister of British Columbia.

(Sgd.) T. D. PATTULLO,
Minister of Lands, British Columbia.

LETTER TO SIR W. T. WHITE FROM HON. JOHN OLIVER.

December 23rd, 1918.

Sir W. T. White,
Acting-Premier, Ottawa, Ont.

DEAR SIR,—Since returning to British Columbia from the Ottawa Conference the question of caring for the returned soldier has become more acute, and, whilst the Conference undoubtedly did much towards arriving at a better understanding, yet I strongly am impressed with the fact that we have not yet got down to a working basis. As you are aware, none of the decisions of the Conference were recorded in writing, and although the British Columbia delegates came away from the Conference with (to them) a very clear conception of what was agreed upon at the Conference, yet at conferences of this kind, where conclusions are not reduced to writing, there are apt to be differences of conception as to what understanding really was arrived at. If you will refer to my letter of the 14th addressed to the Hon. the Minister of the Interior—a copy of which was forwarded to you—you will see what British Columbia already has done, and, as our Legislature will meet in about a month's time, it is advisable that any possibility of error in preparing any necessary legislation should be removed.

Our conception of the conclusions of the Conference, as far as the same affect British Columbia, are as follows:—

(1.) That the Province would exercise its constitutional powers (to the extent of expropriation if necessary) in making suitable lands available for soldier settlement purposes:

(2.) That the Dominion Government would advance to the Province such moneys as might be necessary to make lands for soldier settlement available:

(3.) That the powers of the Soldier Settlement Board would be enlarged to enable them to purchase lands suitable and necessary for soldier settlement from either private persons or the Crown in the right of the Province:

(4.) That Federal aid to soldier settlers only would be made through the medium of the Soldier Settlement Board:

(5.) That the Federal Government desired that there should be no duplication of effort or administration in respect to soldier land settlement:

(6.) That the duty of the re-establishment of returned soldiers in civil life pertains to the Federal Government:

(7.) That the Federal Government desires the assistance and co-operation of the Provincial Governments in the civil re-establishment of returned soldiers in civil life:

(8.) That the Federal Government will designate to the Province the manner and extent of the co-operation desired:

(9.) That the Federal Government is desirous that the Province shall establish, maintain, and operate a Province-wide system of Labour Bureaus, one-half the cost of which will be borne by the Federal Government:

(10.) That the Federal Government will provide vocational training to the extent necessary for the future welfare of those returned soldiers who may be in need of the same:

(11.) That the Federal Government will loan money to the Province for the purpose of providing suitable housing accommodation:

(12.) That the Federal Government will undertake the immediate construction of necessary public works so as to prevent unemployment on any large scale:

(13.) That the Federal Government will advance loans of money to the Province so as to enable the Province to construct necessary public works with a view to preventing any large amount of unemployment.

I would urge that the Province be advised at once of the extent and manner in which Provincial co-operation is desired.

I very strongly am of the opinion that the scale of pensions should be much more liberal than they are at present, and there should be only a small margin of difference as between the private and the officer, and that, whilst a minimum pension should be fixed, the pension actually paid should actually increase in proportion as the cost of living varies above normal.

I also am very strongly of the opinion that the Federal Government should provide for the suitable housing of returned soldiers and their dependents, especially those who are suffering from any degree of disability.

I want to impress upon you in the strongest possible manner that returned soldiers should not be discharged until employment is available for them, and that in each centre of population there should be a house of refuge for returned men out of employment.

I know that there is a feeling of uneasiness existing here as to what may happen should there be any large number of unemployed engaged in demonstration; from the latter to riots and destruction is only a short step.

We constantly are being asked the following questions, and we would like you to advise us thereon:—

(*a.*) Will the Federal Government pay the cost of transporting the soldier settler and his family to the land?

(*b.*) Will the Federal Government make the soldier settler a living allowance for himself and family until he otherwise can become self-supporting?

(*c.*) Will the Federal Government make the returned soldier a living allowance until employment is secured?

(*d.*) **Will the Federal Government assist the returned soldier in—**

Furnishing home;
Live stock for farm;
Tools for his trade;
Relief re mortgages falling due;
Personal equipment;
Professional expenses of students?

(*e.*) For what length of time will the Dominion bear one-half the cost of Labour Bureaus?

Please correct any misconceptions in this letter and reply at an early date.

Yours truly,

JOHN OLIVER.

LETTER FROM SIR W. T. WHITE TO HON. JOHN OLIVER.

OTTAWA, December 31st, 1918.

Hon. John Oliver,
Prime Minister of British Columbia, Victoria, B.C.

DEAR MR. OLIVER,—I beg to acknowledge receipt of your letter of 23rd instant with reference to the subjects discussed at the recent Provincial Conference. I have asked Honourable Mr. Calder, Chairman of the Repatriation Committee of the Cabinet, to write you fully with regard to items numbered 1 to 10 in your communication. He is absent from the Capital for a few days, but will upon his return take the matter up promptly.

With regard to item No. 11, I have already forwarded you a copy of an Order in Council setting out the terms and conditions upon which the Dominion Government will loan money to the several Provincial Governments for the purpose of promoting better housing conditions.

With regard to item No. 12, the Dominion Government has already given attention to the question of continuing essential public works the completion of which was interrupted by the war.

With regard to item No. 13, it does not appear to me, in view of the favourable financial conditions now prevailing, that it will be necessary for the Dominion Government to make loans to any Provincial Government to assist in the construction of necessary Provincial public works. Should it become clearly necessary for a Provincial Government to seek assistance in this regard, we shall be glad, upon request, to take the matter up with them.

I note your remarks as to pensions and the discharge of returned soldiers. You have probably seen by the press the announcement of the Government's policy providing gratuities to discharged members of the Canadian Expeditionary Force which should maintain them until reabsorbed into civil life and occupation.

With kind regards and all good wishes for the New Year, believe me,

Yours faithfully,
W. T. WHITE.

LETTER FROM HON. J. A. CALDER TO HON. JOHN OLIVER.

OTTAWA, ONT., January 8th, 1919.

Hon. John Oliver,
Premier, Victoria, B.C.

DEAR MR. OLIVER,—Your letter of December 23rd, addressed to Sir Thomas White, has been transmitted to me with a request that I should write you fully regarding your statement of the conclusions reached by the Interprovincial Conference recently held at Ottawa, more particularly in connection with the first ten items mentioned in your letter.

As regards the problem of soldier settlement, you have in the main stated correctly the conclusions reached. As it is proposed that privately owned lands should be made available for returned men, each Province should take authority by legislation to secure these lands by expropriation, or otherwise, for the Soldier Settlement Board. It is not contemplated that the power of expropriation will have to be used to any extent. The probabilities are the Soldier Settlement Board in each Province will be able to purchase from private owners such lands as may be required. In all cases where the Board uses Provincial machinery to purchase or acquire land the Federal Government will place at the disposal of the Board such moneys as may be necessary to reimburse the Provinces.

From the discussions held at Ottawa at the time of the Conference it would appear desirable that the powers of the Soldier Settlement Board should be so enlarged as to enable it to deal with every phase of soldier settlement work. It has, therefore, been decided to submit to Parliament the necessary legislation for this purpose. **The feeling here is that but one administrative body should be established. Duplication of machinery would lead only to confusion. The Provinces, therefore, will only be expected to make provision for acquiring privately owned lands, as intimated above.** I am assuming, of course, that a definite understanding has already been reached by the Board with your Province as regards the use of Crown lands for soldier settlement purposes.

With reference to the general question of the repatriation of the returned soldier, I would judge from your statement that you appear to be of the view that the solution of this problem rests entirely at the door of the Federal Government. While the Federal Government recognizes its full responsibility as regards the returned soldier who is physically or mentally incapacitated, the problem of re-establishing in civil life the returned man who is in normal condition is one that requires the combined efforts not only of all the Governments in Canada, but of all the people as well. For the purpose of dealing with one side of this question, the conclusion was reached at the Conference that, so far as employment is concerned, the work should be centred in Labour Bureaus to be established by the Provinces. Some thirty or more of these are now in operation. Doubtless you have obtained through the Minister of Labour full details as to the assistance to be given by the Dominion Government. It has been agreed that Ottawa shall bear one-half the expense entailed in the establishment and maintenance of these offices. As to repatriation work generally, the Dominion Government, through the Repatriation Committee

of the Cabinet, stands prepared to assume responsibility for organizing the nation for the task. The machinery for this purpose has already been set in motion. The co-operation of the Provincial and Municipal Governments, the Patriotic Fund, the Red Cross Society, various friendly societies, churches, and other organizations and bodies is needed and is being secured. Presently we expect to have, from ocean to ocean, an organization that should be able to grapple with the problem and render efficient service.

The Department of Returned Soldiers' Civil Re-establishment, under Sir James Lougheed, has, by Statute, been assigned the task of providing vocational training for returned men, and have been carrying on the work for months past with the co-operation of the Provinces, which have made available their various institutions that are suitable for the purpose. **It is not intended that Provincial Governments should assume any direct responsibility in this field of work.** They can, however, assist materially by permitting the use of Provincial educational and other institutions on terms to be agreed upon.

I am sure you will agree with me that the problem of repatriation that confronts us is, to say the least, a difficult one. What is needed in Canada more than anything else is a clear recognition on the part of our people that the job is one for the nation as a whole. The replacing of three or four hundred thousand soldiers in our civil life is a task that cannot be accomplished by any Government or any set of Governments. Governments can plan, organize, and assist in a large way, but unless our people generally view the problem in the right light and stand prepared to assist in every way possible, I fear there are dangers ahead. The tendency upon the part of many people to shift the entire burden from themselves and place it upon the shoulders of the Government, both Federal and Provincial, is to be deplored. As I have previously stated, Governments can and must assist in a large way, but when you get right down to the final analysis of the problem its real solution will be found to depend upon the whole-hearted, active, and sympathetic support of the Canadian people.

In case there is any further information you desire, I shall be very pleased to furnish same if it is within my power.

Yours very truly,
J. A. CALDER.

LETTER FROM HON. JOHN OLIVER TO HON. J. A. CALDER.

January 17th, 1919.

Hon. J. A. Calder,
Minister of Immigration and Colonization, Ottawa, Ont.

DEAR MR. CALDER,—I write to acknowledge receipt of your letter of the 8th inst., regarding the conclusions reached by the Interprovincial Conference at Ottawa. I thank you for the very full statement of your understanding in this matter, as this clears the question and obviates the chance for any misunderstanding.

With best wishes,

Yours truly,
JOHN OLIVER.

PAPERS

Presented to the House relating to the Pacific Great Eastern Railway, and consisting of: (1) Letter of Burns & Walkem dated November 15th, 1917; (2) Letter of Chief Engineer Proctor dated February 28th, 1919; (3) Letter of Chief Engineer Proctor dated June 10th, 1918; (4) List of Equipment checked up by Morrissey & Anderson as per Chief Engineer Proctor's Letter of June 10th, 1918; (5) Recapitulation of Equipment as per Sheets Nos. 1, 2, and 3.

JOHN OLIVER,
Minister of Railways.

Department of Railways,
February, 1919.

(1.)

STANDARD BANK BUILDING,
VANCOUVER, CANADA, November 15th, 1917.

Honourable John Oliver,
Minister of Railways, Victoria, B.C.

RE ATTORNEY-GENERAL VS. PACIFIC GREAT EASTERN RAILWAY, ET AL.

DEAR SIR,—In pursuance of your request to Mr. Cromie and the writer made on Monday last, that we give you a list of the assets we are prepared to turn over to the Government in consideration of a release of all obligations, we beg to state these assets are as follows:—

(*a.*) *Railroad completed and under Construction*—

Engineering	$ 830,935 00
Construction	13,690,394 00
Additional construction paid by P.G.E. Railway	63,321 00
Construction by Operating Department	441,889 00
	$15,026,540 00
Reasonable contractor's profit at 10 per cent. on construction as above	1,502,654 00
Right-of-way and station-grounds	364,011 00
Howe Sound and Northern Railway purchase	187,299 00
Use, loss, and depreciation of contractor's plant	750,000 00
	$17,830,504 00
General and executive expenses during construction	171,165 00
	$18,001,669 00

The figures given above are the actual costs when labour and material were very much lower than at present, and in order to arrive at present-day values the above figures should be increased very materially.

(*b.*) *Railroad Equipment*—

8 locomotives.
3 flat cars, Nos. 1031, 1032, 1033.
137 flat cars.
50 box cars.
3 refrigerator-cars.
10 gondolas.

5 stock-cars.
10 tank-cars.
1 caboose, C-O.
3 other cabooses.
2 wedge-ploughs.
2 snow-flanges.
1 Marion steam-shovel, No. 1777.
1 pile-driver, No. 1.
1 pile-driver, No. 2.
1 derrick, No. 1.

All other Work Equipment—

108 log-trucks.
3 gasolene motor-cars.
3 trailer coaches.
5 day-coaches.
1 combination coach.
2 baggage and mail coaches.
1 business-car.

$1,153,204 00

(*c.*) *Real Estate.*—The real estate of the Company is set out in detail in Appendix 1 to the audit of the P. Welch books made by Marwick, Mitchell, Peat & Company, copy of which you have in your possession. All this real estate has been paid for in full and is held in the name of the Pacific Great Eastern Development Company, Limited, which Company holds the lands in fee-simple, the number of each certificate of title being set out in said Appendix 1. Shortly, the real estate consists of the Squamish Townsite, the Indian Reserve at Squamish, and the foreshore, the townsite having been taken over from the Howe Sound & Northern Railway at an actual cash cost of $861,275.14. The real estate also includes valuable townsites at Cheakamus, Lillooet, and Williams Lake; at the latter place the Company owns not only the necessary townsites, but very valuable specially selected agricultural lands of a total acreage of 3,009 acres; this property includes the well-known Borland Ranch. At Swan Lake, in the Peace River District, the Company owns three sections of splendid agricultural land, specially adapted for joint terminal of the Edmonton-Dunvegan & British Columbia and Pacific Great Eastern Railways. The former road is now within a few miles of this point.

The total cost of the above land to the Company, with interest and carrying charges, amounts to $1,608,222.

In estimating the value of these lands at the present time, we do not think it should go below cost. The large amount paid for the Squamish Townsite included all the rights, franchises, etc., of the Howe Sound & Northern Railway, and if these assets had not been paid for in this way they would have been purchased and charged to construction cost. In addition, these townsites and foreshore will be of immense value as soon as the road is constructed.

The other lands of the Company, being principally agricultural lands, are worth more to-day than when purchased. For example, as soon as the railroad is constructed to Williams Lake the Company lands in that district will treble in value.

(*d.*) *Rails.*—The rails and fastenings available consist of about 8,000 tons along the line and 220,000 rails and accessories on order. The increased value of these at the present time over cost is approximately $1,150,000.

(*e.*) *Cash in Bank.*—The cash at present in the bank amounts to $277,000. The amount at the time of the P. Welch audit was $409,708, and about $50,000 has since been deposited from sales, and the difference over and above a small loss on operation has been expended in the construction of roundhouses, machine-shops, and station-houses, so that these, with the amount in the bank, leave an actual present value of approximately $459,000 not taken into account under any other heading.

(*f.*) *Sundries.*—These consist of supplies, boats, tools, plant, and office furniture, having a value of $50,000.

(*g.*) *Peace River Extension, $34,458.*—This money was usesd on surveys, rights-of-way, etc., on the Peace River Extension.

Summary.

(*a.*) Railway	$18,001,669 00
(*b.*) Equipment	1,153,204 00
(*c.*) Lands and townsites	1,608,222 00
(*d.*) Rails	1,150,000 00
(*e.*) Cash, buildings, shops, etc.	459,000 00
(*f.*) Sundries	50,000 00
(*g.*) Peace River Extension	34,458 00
	$22,456,553 00

The above figures are very reasonable and will bear the most searching scrutiny by competent appraisers; we feel that a fair appraisement would be far in excess of the figures quoted, as it is well known that the cost of this work was extremely low, so low, in fact, that the sub-contractors complained seriously. The work was done when labour and materials were cheap and by a firm of contractors who are recognized as among the most expert on the continent, as has been demonstrated by the important work entrusted to one of the members of the firm now at the Front.

If there is any further information we can give you in connection with the above figures we will be pleased to do so at any time.

Yours truly,
(Sgd.) BURNS & WALKEM.
Per KNOX WALKEM.

(2.)

DEPARTMENT OF RAILWAYS.
VICTORIA, B.C., February 28th, 1919.

RE P.G.E. SETTLEMENT.

Memo. for the Hon. the Premier and Minister of Railways.

In the Brown & Walkem letter dated November 15th, 1917, and on which all the negotiations were based, 108 logging-trucks appear in a list of equipment set forth therein.

You knew and the firm of Foley, Welch & Stewart was also aware of the fact that only three connected trucks should have appeared in this list, as the balance of the trucks was shipped off the line between April 30th, 1917, and September 9th, 1917, or two months before the offer was made.

A. F. PROCTOR,
Chief Engineer.

(3.)

DEPARTMENT OF RAILWAYS.
VICTORIA, B.C., June 10th, 1918.

Memo. to the Premier and Minister of Railways.

DEAR SIR,—The equipment as shown on sheets Nos. 1, 2, and 3, and the summary dated September 30th, 1916, and filed as Exhibit 175, before the Investigating Committee, has been checked on the ground by Messrs. Morrissey and Anderson, and found correct with the exception of the logging-trucks, all of which, except three connected, have been sold. The above-mentioned sheets and summary have been compared by me with the equipment record and found to be correct.

Yours truly,
A. F. PROCTOR,
Chief Engineer.

SECOND ANNUAL REPORT

OF

THE LAND SETTLEMENT BOARD

OF THE PROVINCE OF

BRITISH COLUMBIA

FOR THE YEAR ENDING

DECEMBER 31ST, 1918

PRINTED BY
AUTHORITY OF THE LEGISLATIVE ASSEMBLY.

VICTORIA, B.C.:
Printed by WILLIAM H. CULLIN, Printer to the King's Most Excellent Majesty,
1919.

To His Honour Sir Frank Stillman Barnard, K.C.M.G.,
Lieutenant-Governor of the Province of British Columbia.

May it please Your Honour:

The undersigned has the honour to present the Second Annual Report of the Land Settlement Board for the year ending December 31st, 1918.

All of which is respectfully submitted.

E. D. BARROW,
Minister of Agriculture.

Victoria, B.C., January 31st, 1919.

LAND SETTLEMENT BOARD OF BRITISH COLUMBIA,

VICTORIA, B.C., January 31st, 1919.

The Honourable E. D. Bárrow,

Minister of Agriculture, Victoria, B.C.

SIR,—I have the honour to transmit herewith the Second Annual Report of the Land Settlement Board of British Columbia for the year ending December 31st, 1918.

I have the honour to be,

Sir,

Your obedient servant,

MAXWELL SMITH,

Chairman.

Land Settlement Board of British Columbia.

Pursuant to the policy outlined in our Annual Report for the year ending December 31st, 1917, the Land Settlement Board has very materially reduced the volume of the money-loaning business during the past year, as well as insisting that a larger percentage of the amount loaned be devoted to improvements to the security offered, thereby "promoting increased agricultural production."

Land settlement and development has occupied the major portion of the Board's attention the past twelve months, with the result that a great volume of valuable data is now on hand consequent upon personal investigation of numerous and extensive areas of land by the Directors throughout the Province. Special attention has been given to the unoccupied Crown-granted lands situated convenient to transportation and markets, and that which has been acquired is being offered for sale on easy terms of payment to *bona-fide* agricultural settlers who are qualified and willing to assume the responsibilities of Canadian citizenship.

The following are some of the important recommendations of the Board submitted for the approval of His Honour the Lieutenant-Governor in Council:—

(1.) The resale of 69,991 acres of pasture land north of Hudson Hope, B.C., to the Peace River Land Company, Limited, for $200,000, on conditions of $30,000 being expended in improvements on the property before June 30th, 1921, and maintaining stock on the lands up to its feeding capacity, at least until July 1st, 1923, and until such time thereafter as the full purchase price, with interest and taxes, have been paid. January 15th, 1918.

(2.) The thorough investigation into and survey of the Kootenay Flats near Creston, B.C., to ascertain the feasibility of that reclamation project. January 30th, 1918.

(3.) The securing of feasibility report on the Cherry Creek irrigation project, affecting approximately 8,000 acres. January 30th, 1918.

(4.) The purchase of 482 head of cattle for resale to the farmers of the Bulkley Valley at a cost of $23,579. February 1st, 1918.

(5.) The purchase of 5,850 acres of land on Pitt Meadows from the Pitt Meadows Land Company, Limited, at $55 per acre, and 1,050 acres adjoining from the Pitt River Farm and Construction Company, Limited, at $75 per acre. February 21st, 1918.

(6.) The constitution of the Cameron Drainage District to reclaim approximately 400 acres near Nanaimo, B.C. March 7th, 1918.

(7.) The purchase of the Coldstream Estate and the White Valley irrigation system, including all live stock, implements, and general equipment, approximately 13,000 acres, at a cost of $900,000, payable in twenty-year 5-per-cent. bonds. April 17th, 1918.

(8.) The expenditure of approximately $10,000 in securing a reliable engineering report on the feasibility of reclaiming Sumas Lake and adjacent lands. April 29th, 1918.

(9.) The establishment of Settlement Area No. 1, 14,500 acres, near Telkwa, B.C., and Settlement Area No. 2, 35,000 acres, near Vanderhoof, B.C., on the Grand Trunk Pacific Railway. July 2nd, 1918.

(10.) The purchase of 14,000 acres of logged-off lands in the Comox Valley from the Canadian Western Lumber Company at $5 per acre. December 18th, 1918. Option secured accordingly, December 28th, 1918.

(11.) The establishment of Settlement Area No. 3, near Fernie, containing 1,500 acres. December 19th, 1918.

(12.) The desirability of proceeding with the Cranbrook drainage scheme at Cranbrook to reclaim approximately 400 acres. December 20th, 1918.

Of the above-mentioned projects, six have been approved—viz., No. 3, No. 4, No. 6, No. 8, No. 9, and No. 11—and proceeded with accordingly.

OPERATIONS OF LAND SETTLEMENT BOARD TO DECEMBER 31ST, 1918.

1. Number of Agricultural Credit Commission applications pending and unappraised at December 31st, 1917, 109, value		$190,900 00
Above were dealt with as follows:—		
60 rejected or withdrawn	$115,150 00	
12 granted for $23,150. Applied for	28,350 00	
11 action pending	25,250 00	
26 unappraised	22,150 00	
109		$190,900 00
Status of Agricultural Credit Commission loans—		
490 loans granted prior to 1918 for		$941,950 00
19 loans granted during 1918 for		31,300 00
509 Total loans granted		$973,250 00
106 loans cancelled prior to 1918		$153,400 00
16 loans cancelled during 1918		41,000 00
122 Total loans cancelled		$194,400 00
509 loans granted		$973,250 00
122 loans cancelled		194,400 00
387 Net number of loans		$778,850 00
5 loans have been paid off		5,500 00
382 loans in force		$773,350 00
There are 7 loans where the mortgage moneys have not yet been advanced, amount granted		$ 7,650 00
Balance of Loans Account at December 31st made up as follows:—		741,417 45
Principal	$735,708 93	
Interest due	5,708 52	
During 1918 payments were received on account of loans as follows:—		
Interest paid	$ 43,075 97	
Principal paid	26,974 66	
Total	$ 70,050 63	

Statement of revenue and expenditure and balance-sheet are submitted herewith.

2. There were Land Settlement Board applications pending and unappraised at December 31st, 1917, 44, value		$ 67,130 00
These were dealt with as follows:—		
20 rejected or withdrawn	$ 40,630 00	
18 granted for $17,750. Applied for	22,050 00	
3 pending	2,600 00	
3 unappraised	1,850 00	
44		$ 67,130 00
Applications received during the year 1918, 145, value		$366,150 00

The above were dealt with as follows:—

66	granted, $165,150.		
	Applied for	$197,950 00	
52	rejected or withdrawn	121,700 00	
6	pending	13,500 00	
21	unappraised	33,000 00	
			$366,150 00
145			

Status of Land Settlement Board loans—

Loans granted in 1918—		
96	loans granted as above	$206,050 00
6	loans reconsidered	4,200 00
102	Total	$210,250 00
Loans cancelled in 1918—		
23,	amount	$29,250 00
Total Land Settlement Board loans granted—		
246,	amount	$511,600 00
Less 29	loans cancelled	42,750 00
217	loans in force	$468,850 00
	Amount still due to borrowers	$107,425 14

Statement of revenue and expenditure and balance-sheet are submitted herewith.

In analysis of the statement of revenue and expenditure for the year 1918, due consideration should be given to the fact that a good deal of time was spent and expense incurred by the Directors in the investigation of numerous propositions which may properly be termed land-settlement projects. Many of these were found to be not feasible at the present time, and hence the expense incurred necessarily augments the outlay as shown in the statement as submitted.

There is another factor in the varied operations of the Board in relation to the Government of the Province which to a considerable degree offsets the direct expense incurred, and that is the greatly increased revenue derived through the payment of taxes, which in many cases were several years in arrears. This applies not only to taxes on land in the settlement areas, but also to properties throughout the Province on which loans have been advanced.

Too great emphasis cannot be laid on the very great assistance which has been rendered the farmers through the loans advanced. During the year approximately $280,000 has been advanced for purposes of making improvements, buying stock, etc., in addition to the $23,579 expended for stock imported as previously noted, which is not only an immediate help, but one whose cumulative benefits will extend through the coming years.

All of which is respectfully submitted.

MAXWELL SMITH,
Chairman.

I hereby certify that the accompanying balance-sheets are in accordance with the books of the Land Settlement Board (including the separate books of the Agricultural Credit Commission), and exhibit a true and fair statement of the financial position of the Board as at December 31st, 1918, and the result of the operations for the year ended that date. The Board has not, however, statutory authority to make advances, amounting to $11,430.37, out of Land Settlement Board funds on behalf of the following dyking districts and dyking projects: West Nicomen, Sumas, Cameron Lake, Cherry Creek, and Cranbrook; and I have so reported to the Honourable the Minister of Agriculture.

A. N. MOUAT,
Comptroller-General.

PROVINCIAL INDUSTRIAL SCHOOL FOR GIRLS.

SUPERINTENDENT'S FIFTH ANNUAL REPORT.

VANCOUVER, B.C., November 30th, 1918.

Honourable J. W. de B. Farris,
Attorney-General, Victoria, B.C.

SIR,—I have the honour to submit to you and the Honourable Members of the Legislature the Fifth Annual Report of the Provincial Industrial School for Girls, from January 1st to November 30th, 1918.

The present incumbent assumed the duties of Superintendent on January 1st, 1918. Since no two persons work alike, it was deemed best to make a complete change of policy rather than attempt to revise the old system. This will explain the changes noted below.

The policy pursued is to have the girls realize that this is not so much a place of punishment, but rather that here they are given another chance to make good. Believing that girls would prefer to be good girls and to be held in esteem by good people, no effort has been spared to achieve this purpose. The prison style of wearing the hair was abolished the very first day. Bright ribbons and pretty modes of hairdressing are encouraged. The unbecoming uniform has been replaced by one more girlish and pleasing.

A system of honour stripes has been adopted. For being on the honour roll for three months a girl is entitled to one stripe. Four stripes may thus be earned. A further period of three honour months will earn a different style of dress known as the honour or trusty uniform. An additional period of three honour months gives the right to wear a white collar on the trusty uniform.

As far as possible the honour system has been introduced. The transition here to the honour system had the customary results experienced in other institutions making the change—namely, an increased number of runaways. The new liberty had much the same effect as that of emancipation upon the negroes of the South, whose first act of freedom was to run away.

Instead of meals being eaten in silence under rigid surveillance, conversation in moderate tones is permitted under staff supervision. After repeated changes in the personnel a staff has been engaged who are not only efficient, but whose manners, temperament, and high ideals make them examples worthy of emulation. A harmonious home atmosphere has been effected.

Sufficient time has not elapsed to test the results of the honour system upon the released inmates. So far as conduct in the school is concerned, the girls have a kindlier attitude towards the staff, whom they regard as friends rather than custodians. Their attitude towards each other is gentler, more refined, and more moral. They work more cheerfully and take pride in doing it well.

System of Marks.—In adopting a new system of marking, it was deemed best to emphasize desirable features in character-building, and the following plan has been adopted:—

	MARKS.
Honesty, including honesty of purpose	1
Punctuality	1
Orderliness	1
Courtesy	1
Spirit towards work and institution generally	1
Effort	1
Good influence	5
Efficiency	5

Four marks are allowed to the Superintendent to correct any overindulgence or severity on the part of the staff. For one week's good conduct one day of time is remitted. For one month's good conduct one day additional is remitted.

A group of Vancouver women interested in the welfare of the institution have presented a handsome Victrola. A number of friends have contributed records that are an endless source of enjoyment.

To the Vancouver Woman's Musical Club the school is indebted for the gift of a very fine piano. Individual members of the same club are giving lessons to the girls in both piano and voice.

Under the auspices of the University Woman's Club there was conducted a Little Mothers' League, at which were given a series of talks on "The Care of the Baby." These were illustrated by using a life-size baby doll, a complete layette, baby bed, and food equipment. The lectures were given by Miss Cole, of the Victorian Order of Nurses; Miss Breeze, Head Nurse for Vancouver City Schools; and Miss Waterman, Superintendent of Infants' Hospital.

Visitors.—During the year there were many visitors to learn of the working of the institution. Among these were the Honourable the Attorney-General, J. W. de B. Farris; the Honourable the Minister of Lands, T. D. Pattullo; Mrs. Ralph Smith, M.L.A.; Rev. F. A. Robinson, M.A., Toronto, Secretary of Evangelism for the Presbyterian Church of Canada; Rev. A. M. MacDonald, Edmonton, Superintendent of Neglected Children for Alberta; and the well-known author, Mrs. Nellie McClung, Edmonton. The latter gave a most inspiring talk to the girls, by whom it was very much enjoyed.

All the girls are given training in the countless details of housework, including cleaning, washing, ironing, cooking, bread-making, care of and waiting upon the table, and the mending and making of clothing. All this is on an institutional scale. When a course in Domestic Science is established it is hoped that the girls will be trained that they can assume full charge of the domestic work in the best houses.

In the school-room the half-day system is followed. The sessions have been lengthened to three hours instead of two hours and a half. Special training is given in drill and sight-singing in music. Excellent progress is being made under a painstaking teacher.

A Commercial Course has been established, covering instruction in stenography and typewriting. No one is permitted to take up the Commercial Course without having an academic standing equal to Entrance-work in the public school. By the end of the year five girls will be fitted to fill positions as stenographers, while one other has already gone out to complete her course in a city business college. Economic independence will do much towards sustaining a girl's moral reclamation.

During the early summer the men from Oakalla Prison Farm cleared an acre of ground. Part was completed in time to plant with potatoes that yielded at the rate of 7 tons to the acre. The remainder of the clearing was given over to our five "Victory" pigs, maintained at small outlay and valuable not only as food, but for rooting and fertilizing the raw land.

From the clearing there was salved some 65 cords of wood and about 1,000 lineal feet of cedar posts, ample compensation for the expenditure involved.

A number of minor improvements were made in the building, rendering it more secure and convenient. The former tile roof was used to pave the driveway. A dormitory that lacked dressing and lavatory facilities was converted into two staff bedrooms and staff sitting-room. Two other dormitories were provided with inspection windows between staff bedrooms and dormitory. Two rooms in the staff quarters were converted into secure and sanitary cell chambers by using cages from the Oakalla Prison Farm, thus replacing the unlighted, unventilated, and insanitary "black hole" formerly in use.

Commodious linen, medicine, and school-room cupboards were built on the dormitory floor. Electric bells now connect the dormitories with the staff rooms, enabling the girls to communicate with staff in case of illness or emergency instead of shaking the doors and waking the whole house.

The drying-room in the laundry has recently been made available for drying purposes for the first time in the history of the institution. Clothes-boilers have been built in that greatly facilitate the work on washing-days.

Instead of using the septic tank the sewer has been connected with the city sewage system.

All these changes kept a number of workmen busy on the premises for many weeks. This very much restricted the outdoor occupations of the girls, and the unusual noises and activities are largely responsible for the difficulties in discipline in the early summer.

Early in the year Dr. Mary Campbell made a careful examination of each girl. As a result about 50 per cent. of them were given specific treatment for venereal infection. The number is now greatly reduced. Each new arrival is segregated in the hospital until the doctor has pronounced her free from contagion. She is then given sleeping-quarters in the dormitory.

The general health of the girls has been carefully looked after by the matron, who is a trained nurse. One inmate, a chronic invalid, required constant care for six months. Ever since her discharge from here she has been a patient at the Vancouver General Hospital. During the recent epidemic there were but two mild cases of influenza. Our immunity is due to scrupulous cleanliness, plain, wholesome diet, regular hours, daily fumigation, and unceasing vigilance.

The reports of the schools most successful with delinquents show that the psychological tests are used as a scientific basis for reform-work. The inability to resist temptation owing to subnormal mentality is the cause of most failures in the work of moral reclamation.

This institution was fortunate to secure the services of the psychological clinician on the staff of the Vancouver public schools. The psychological report of Miss Martha Lindley shows a large percentage of subnormals in this school. It is worthy of serious thought and points to the very urgent need of providing constant custodial care for many of the inmates, so that society may be relieved of a serious menace and a perpetuation of feeble-mindedness.

The year's experience has shown that provision ought to be made for the separate accommodation of the persistently incorrigible and vicious, who are a constant disturbance to the well-being of the institution, and who very much lessen the chance of reform among the more promising ones. This will obviate the necessity of using a wing in the Oakalla Prison Farm for the older and more vicious girls who are committed here from the Police Court.

Number of Inmates received.—The roll of the institution on January 1st showed thirty-nine inmates. During the year twenty new girls were received, making a total of ninety admitted since the opening of the building on April 3rd, 1914. Of these, thirty-six are still inmates of the institution.

Released on Probation or discharged.—During the year we have released on probation or discharged twenty-three girls. Of these, eight were returned to the custody of the parents; seven who had not suitable homes with relatives were placed in good positions at a proper rate of wages; two were placed on probation to the Vancouver City Mission; two were given into the custody of the Indian Department; one was made a ward of the Catholic Children's Aid; one was apprenticed to the monastery; one was transferred to the Salvation Army Maternity Home; one was released by an order from the County Court.

Countries where born.—Of the thirty-six girls now in the school, twenty-five were born in Canada, four in the United States, four in England, and three is Scotland.

Nationality.—Thirteen are of Canadian descent, ten of English, five of Scotch, three of half-caste Indian, two of Indian, two of American, and one of Irish.

Length of Sentence.—Five are given two years; thirty-one have been given indefinite sentences of not less than two years.

Age at Commitment.—At eleven years, 1; twelve years, 1; thirteen years, 2; fourteen years, 6; fifteen years, 8; sixteen years, 11; seventeen years, 7.

Offences committed.—Incorrigibility, 26; theft, 5; keeping house of ill-fame, 2; vagrancy, 1; arson, 1; forgery, 1.

Escapes.—During the year there have been twenty-two escapes. All were soon recaptured, some within half an hour after their exit. There are many causes for these runaways; chief among them are lack of active employment, lack of physical exercise, the exposed and public situation of the institution, and the subnormal mentality of over 50 per cent. of the girls that makes them the victims of unwise leadership.

The insecurity of the building has been largely corrected, making a contemplated exit somewhat more difficult and discipline by segregation a possibility.

More outdoor work is a paramount necessity. It provides wholesome exercise, can be made instructive in the knowledge of growing things, turns into useful channels all surplus energy, and is conducive to moral conduct. Hence the urgent desire that the area of tillable land be extended by clearing the entire acreage around the building.

A substantial fence should enclose the cleared portion of land. This will also obstruct the view of ill-disposed passers-by and prevent the present almost nightly visits from prowlers around the building. Some sort of covered structure should be provided for exercise in rainy weather.

The ideal aimed at is to give the girls as great a share in outdoor work and games as in housework. To inculcate a love for animal pets and for all growing things, to create a love for

a wholesome outdoor life and simple pleasures, will go far to effect a girl's moral reclamation. Besides this, the labour of the girls will greatly assist in making the place self-supporting.

In conclusion, I would respectfully suggest that a copy of the evidence or a history of the facts of the case be furnished with a girl's commitment papers. The officers accompanying the girls very often do not know their charge's history. The girl herself seldom reports it correctly, so that the Superintendent is at a disadvantage in not knowing the girl's true story, and the work of reformation is hampered.

The following is the present staff of officials:—

Superintendent—Margaret W. Bayne.
Matron—Mary B. Menzies.
First Assistant—Laura Jewell.
Second Assistant—May Mitchell.
Laundrywoman—Jennie F. Ham.
Needlewoman—Barbara Sample.
Cook—Grace Grant.
Teacher—Janet A. G. Mill.
Commercial Teacher—Annie Edgell Sprott.
Gardener—F. W. Cameron.
Engineer—J. R. Clark.

All of which is respectfully submitted.

MARGARET W. BAYNE,
Superintendent.

Memo.—In noting the quantity of work performed for the period, it should be borne in mind that the majority of the tabular work was printed in very small type (Nonpareil), nearly all of the pages containing not less than 6,600 ems, and that, according to established rules, double composition should be allowed for this description of work. Although the above return shows the net results for the period, yet a large amount of unavoidable additional work was necessitated by making alterations from the original drafts in Bills submitted to the Legislature, and in reports and other documents, which it is impossible to include in this return.

Persons and Departments to whom Statutes, Journals, and Sessional Papers have been distributed during twelve months ending March 31st, 1918.

To Whom Distributed.	Statutes, 1917.	Journals, 1917.	Sessional Papers, 1917, 2 Vols.

REPORT

Of the Acting Minister of Justice upon the Statutes of the Legislative Assembly of the Province of British Columbia passed during the Session of 1918.

By Command.

J. D. MacLEAN,
Provincial Secretary.

Provincial Secretary's Office,
May 16th, 1919.

P.C. 949.

Certified Copy of a Report of the Committee of the Privy Council, approved by His Excellency the Governor-General on the 6th May, 1919.

The Committee of the Privy Council have had before them a report, dated 3rd May, 1919, from the Acting Minister of Justice, submitting that he has had under consideration the Statutes of the Legislature of the Province of British Columbia, passed in the eighth year of His Majesty's reign (1918), and received by the Secretary of State of Canada on the 14th day of May last, and that he is of the opinion that these Statutes may be left to such operation as they may have.

The Committee, on the recommendation of the Acting Minister of Justice, advise that a copy hereof, together with the accompanying report, be transmitted to the Lieutenant-Governor of British Columbia for the information of his Government.

All which is respectfully submitted for approval.

RODOLPHE BOUDREAU,
Clerk of the Privy Council.

His Honour the Lieutenant-Governor of British Columbia.

Department of Justice, Canada.

Ottawa, 3rd May, 1919.

To His Excellency the Governor-General in Council:

The undersigned has the honour to report that he has had under consideration the Statutes of the Legislature of the Province of British Columbia, passed in the eighth year of His Majesty's reign (1918), and received by the Secretary of State for Canada on the 14th day of May last, and he is of the opinion that these Statutes may be left to such operation as they may have.

The undersigned recommends that a copy of this report, if approved, be transmitted to the Lieutenant-Governor of British Columbia for the information of his Government.

Humbly submitted.

(Sgd.) Arthur Meighen,
Acting Minister of Justice.

1919.

VICTORIA, B.C., February 28th, 1919.

To His Honour Sir FRANK STILLMAN BARNARD, K.C.M.G.,
Lieutenant-Governor of the Province of British Columbia.

MAY IT PLEASE YOUR HONOUR:

Herewith I beg respectfully to submit the Annual Report of my Department for the year ending December 31st, 1918.

T. D. PATTULLO,
Minister of Lands.

VICTORIA, February 26th, 1919.

The Honourable T. D. Pattullo,

Minister of Lands, Victoria, B.C.

SIR,—I have the honour to submit the Annual Report of the Department of Lands for the twelve months ending December 31st, 1918.

I have the honour to be,

Sir,

Your obedient servant,

G. R. NADEN,

Deputy Minister of Lands.

DEPARTMENT OF LANDS.

REPORT OF OFFICE STATISTICS.

February 28th, 1919.

G. R. Naden, Esq.,
Deputy Minister of Lands, Victoria, B.C.

SIR,—I have the honour to submit report of the administration of lands in the Province during the year 1918, namely:—

(1.) Statement showing the number of pre-emption records, certificates of improvement, and certificates of purchase issued:
(2.) Statement of Crown grants issued, divided into different classes, showing the total acreage of Crown-granted pre-emptions, mineral claims, and purchased lands:
(3.) Statement of coal-prospecting licences, coal leases, and sundry leases issued, showing the approximate area thereof and the fees and rentals collected in connection therewith:
(4.) Statement of land-sales, showing the area of surveyed and unsurveyed lands sold:
(5.) Statement of the number of pre-emptions inspected during 1918:
(6.) Statement showing the revenue received by the Lands Branch, Victoria, from various sources:
(7.) Comparative statement of the various land transactions since the year 1906.

I have, etc.,
H. CATHCART,
Superintendent of Lands.

REPORT OF THE COMMISSIONER OF GRAZING.

November 9th, 1918.

The Deputy Minister of Lands,
Victoria, B.C.

Sir,—During the past two months, which have been spent continuously in the range country of the Province east of the Cascade Divide, certain conclusions have been reached regarding the use and management of the vacant Crown lands available for grazing purposes. These conclusions, while no means definite as to the details of local management in the various districts or as to what will be later known as sectional range units of the area covered, embrace principles of range-management which will be closely followed in the future handling of the open range in the development of the live-stock resources of the Province. I have discussed these matters with the stockmen individually and at various gatherings, and the consensus of opinion is clearly in favour of active and effective control of the grazing ranges by the Government.

Description of Range.

From the view-point of range-management there may be said to be two topographic types of range available for use: (1) The vast area lying between the Fraser River on the west, the Similkameen on the south, and the Rocky Mountains on the east; and (2) the more rugged and mountainous areas outside of the approximate boundaries of the first type mentioned.

The first type approaches more closely what is desired for range cattle than for sheep on account of its comparatively level character and general absence of the luscious, weedy annual plants found on the higher and more moist areas of the rugged and mountainous regions.

In general the forage-growth of the first type includes bunch-grass and blue-grass, with scattering bromes and rye-grasses, as the predominating plants on the lower, more open south slopes, with pine-grasses as the main forage in the timber. Scattered lupines and other weed-plants occur in the timber, but in general the pine-grasses are predominant. Although very nutritious, they are of such coarse character that they afford much better feed for cattle than for sheep. Sheep will do well on such range, but cattle will get much more out of it than sheep, as much waste of forage will usually result when it is grazed by the latter. This waste may to a great extent be overcome by careful and systematic burning, but, nevertheless, the pine-grass is not as suited to the needs of the ewe and lamb as to the cow and calf. The growing lamb matures so much more rapidly than the calf, and therefore requires a more tender ration than the pine-grass affords if it is to make its best and most profitable growth.

Scattered throughout this first general type, however, are many areas of comparatively steeper range which cannot be used to advantage by cattle and which afford excellent range for sheep. In some instances there are areas which will afford range for one or more bands of 1,200 head of old sheep to the band. There are many sections where but one band can be accommodated. Areas of this character are to be found in the vicinity of Brookmere, Clinton, Nicola, Pavilion Mountain, and other places.

In the use of this range, however, the desires of the interested settlers will predominate. Many are interested in cattle and many in sheep; whatever class of stock a man desires to run, he can make a success of his venture with reasonably good management in spite of the fact that the summer range he uses is better adapted to the grazing of one class of stock than to another. The raising of various classes of stock in any section of country will have a broadening influence on the general live-stock education of that section, and a more definite stabilization of its prosperity will result than if its operations were confined to the growing of but one class of stock.

The second or more rugged type of range is, as has been stated, very desirable sheep-range. The lower slopes afford the usual bunch and blue grass; the range of medium height, the pine-grasses; while the upper areas closer to the snow-line produce the weedy annuals so essential to the ewe giving milk for a rapidly growing lamb, which a few weeks after birth is eating freely of the herbage on such range. Above timber-line is found, often in dense growth, many of the palatable, low-growing sedges and grasses which are very desirable on any sheep-range. The many meadows available also produce abundantly, and, while in themselves they could be used perhaps as well by cattle as by sheep, they are more suited to the latter, since sheep can use all or most of the surrounding range and cattle cannot. The wet meadows of the upper ranges are often susceptible to damage by cattle on account of the trampling of the moist soil which is not in evidence in sheep-grazing.

In the use of this type, however, the desires of the settler living adjacent, who will make use of it, must prevail. It will no doubt develop, however, that as the stock industry grows, the use of such range will be divided by agreement between cattle and sheep men operating the ranch property adjacent and dependent upon it.

As in other sections of the continent where similar range is available and is being used, the canyon-bottoms and lower benches are devoted to cattle-grazing and the upper and more rugged slopes to sheep-grazing, with areas of low range set aside for the use of the latter class while passing from the winter to the summer range.

CONDITION OF THE RANGE.

As a general statement, it may be said that the condition of the lower or open bunch-grass ranges is bad, while that of the timbered range is good.

The range such as that of the first type referred to as desirable cattle-range is of such comparatively even elevation that areas of open grass lands producing bunch-grass occur throughout it all and at the highest elevations. As this type is in more or less general use without proper system of control, the open grass areas are heavily grazed during the whole of the open season. The consequence is that the grasses have not had an opportunity for years to mature and they are rapidly weakening in growth each year. In some instances the range is in a sadly depleted condition and will require years of careful management to restore it. In other instances where the use has not been very heavy in the past two or three years, proper protection during the growing season will make for a good growth of grass which will be available for fall grazing. Where heavy overgrazing has resulted in an advanced stage of depletion, it will be extremely advisable to protect the grass entirely during the spring or growing season for several years. But where the damage is not great and good results will follow two or three years' protection in the early part of the season, light grazing in the spring, so that not more than 50 per cent. of the growing plants will be consumed, will not retard restoration seriously.

Bunch-grass plants very much weakened by overgrazing seldom produce seed, the viability of which is sufficient to have a marked influence on the restoration of any area. If the plants are given the chance to make sufficient growth so that plant-food for succeeding years of growth can be manufactured and stored away in the root system, the plant will be strengthened and will rapidly increase in size and strength.

The timbered portions of range on areas which are in general use for grazing are but lightly touched. When grazed it is because the only water available is located in the timber and the bunch-grass or open portions are practically denuded of forage. This is to be expected where no system of range-management is practised, because cattle will naturally congregate and graze on areas upon which is found the most palatable and sweeter forage. The bunch and blue grass of open areas are more palatable and sweeter than the coarser and harsher pine-grasses; consequently the stock will graze the former and slight the latter if not induced to frequent and graze the timbered range.

The correction of this uneven use of range requires systematic co-operation between the stockmen who use it and the Government which controls it. The practical management should ultimately devolve upon the stockmen under the direction and supervision of the Government.

When we speak of the open range, reference is made to that which is used by stock turned out to graze from the time the home or winter range pastures are not in use, or from the opening-up of spring until the snow flies and necessitates the gathering-in of the stock on the winter ranch. This open range must furnish forage for spring, summer, and fall, and in general may be said to consist of spring feed on the lower or open areas consisting mainly of grasses, mid-summer feed in timbered areas made up generally of pine-grasses, weedy annuals, and the rushes and sedges of meadows, and fall feed on areas of low or open grass range protected during the spring in order to afford feed for fall grazing. This is the natural and only feasible division of any range to secure good results, and when the division is made a basis for the correct system of management is laid.

RANGE IMPROVEMENT.

The systematic management of a range, therefore, requires: (1) Its division into spring, midsummer, and fall range as nearly as possible; and (2) the even grazing of stock over its area. The latter case can be accomplished in the case of cattle by: (*a*) The development of

watering-places; (*b*) the correct distribution of salt; and (*c*) the construction of drift or division fences. And in the case of sheep: (*a*) By development of watering-places when necessary; and (*b*) the application and adoption of a grazing plan for each allotment.

All of the ranges examined are not alike in their make-up. Many are ideal; that is, they furnish enough spring and fall range, if properly protected, to balance the midsummer range available. Others are unevenly made up, having, perhaps, too little or too much of spring, midsummer, or fall range, and, as is often the case, the available open range on Crown lands is midsummer range only. They must therefore be managed somewhat differently, although the same principles will apply to all. For example, a range which furnishes only midsummer range and which can only be used during that period without damage resulting to the forage would require that the stock be kept on other lands until the forage is ready for use. Again, a range which had but little true midsummer range of the weed and browse type, but had plenty of the open or actual spring and fall range, would necessitate more grazing on dry range during the summer period than best results in beef or mutton products would ordinarily call for.

The improvement of ranges by water-development contemplates the development of springs and seeps by digging out, fencing, and troughing, so that the water will be evenly distributed over the range, and stock will consequently not have to travel far to and from water. Where watering-places are widely scattered there results heavy grazing near the water and light or no grazing at all at a distance from the water, or, in other words, an uneven use of the range.

This condition can be remedied to some extent by the proper placing of salt on the range, but it is always essential, if the most beneficial results are to follow, to plan for the development of springs and seeps not now affording adequate water for the surrounding range, and in this way cut down the distance of travel between water and salt.

The use of more salt on the open ranges is important, as well as its proper distribution. I find that it is the general practice to throw down the salt at the most convenient place on the range. This is generally along roads and trails, and particularly in the vicinity of water and at places where cattle are in the habit of congregating. Years of such practice has, of course, developed these congregating grounds, so that the habit of hauling the salt to these places year after year is generally well established, with the natural result that overgrazing around the watering-places is well developed, to the injury of the stock and range. There is also a heavy loss of good forage through lack of use of the range at a distance from the water.

In many cases I find this unsystematic use is retarding seriously the development of the stock industry. When but a portion of the range is being used the balance must necessarily be counted out of capacity estimates, and when the used portion is being seriously overgrazed and decreasing in carrying capacity each year there is a tendency to cut down the herds rather than to increase them and slacken up in the hay-producing development of the winter ranches. There are in the aggregate thousands of acres of undeveloped hay lands on a great majority of the ranches which will raise hay sufficient for many thousands more head of stock that can be more than well provided for with summer range. It can be said that the summer ranges of the Province are unlimited so far as they relate to the capacity of the winter ranches.

To develop a correct use of the summer ranges, therefore, all users must realize that the placing of salt in the vicinity of watering-places is a great mistake. Salting-grounds should be established at a distance from the water. An ideal range should have watering-places not more than a mile apart, with salt-troughs between them. Thus the salt-troughs would also be not more than a mile apart, and there would result a quiet feeding between water and salt which would so evenly distribute the cattle that the maximum in improvement and in carrying capacity will be attained. Practice and observation will enable the men in charge of the stock on the range to improve preliminary plans.

The construction of drift and division fences on cattle-ranges is often important, especially on those ranges where the topography permits the wandering of cattle from one division to another or on to adjacent sheep allotments. They are important in that they assist in the round-up by confining the cattle to designated ranges and preventing loss from straying.

The drift-fence is that which marks the exterior limits of the range unit, and the division-fences are those constructed to divide spring or fall from midsummer range, or, perhaps, the beef from the cow range. They are variously used, and in the protection of much of the lower or grass ranges of the Province on the more level types may eventually be very necessary. Areas like the Lumdum and Hamilton Commonages require drift and division fences to make adequate provision for their restoration.

Generally speaking, however, the development of water resources where possible and the correct distribution of salt may be relied upon to bring excellent results in developing a use of the now neglected timber areas and the protection of grass-producing range.

Referring in particular to the use of sheep-range, it may be said that water and adequate plans will accomplish all that is necessary in the protection of the allotments. Sheep are herded and the application of any plans for the use of an allotment should be easy, and little excuse can be made for not following the broad requirements of any plan.

The sheep industry is so small in the Province that but little range has suffered from overgrazing by sheep. As the industry develops and new range is opened up, the chief concern will be the prevention of heavy grazing on areas where herders as a rule find it easy to feed the sheep, and forcing a use of areas supporting excellent feed, but upon which it appears to be more difficult to herd. Each plan as compiled will contemplate, as in the plans for the use of cattle-range, the grazing of low range early, the higher and more remote range in midsummer, and a return to the protected fall range of the lower slopes, alternate grazing on the grass ranges to be practised to ensure maximum production.

ALLOTMENT.

The careful and correct management of the range will require its division between the two principal classes of stock, cattle, and horses in the one, and sheep and goats in the other. Cattle and horses can be more economically and successfully managed in allotted community ranges instead of individual allotments. They are turned loose to graze, and there is always an intermingling of stock on each distinct unit of range, which, for best results, will necessitate co-operative management by the owners of such stock working together as an association.

These associations for range-work may comprise two or more owners. Individual cattle-ranges will not be the general rule, and should not be sanctioned in any plan of range-management unless there is such isolation in evidence that the cattle cannot mix with others and friction over boundary-lines is not possible. Individualism in allotments may be considered so far as the salting and development-work on a portion of a range unit is concerned, but not to the extent of giving one man absolute control of a particular area upon which his neighbour's cattle will stray, and from which his own will drift, that he will feel called upon to complain about drift upon his allotment. Absolute isolation should be apparent before the individual cattle allotment is considered. Where one man is in the habit of turning his cattle on one portion of a range unit and another on a separate portion and they intermingle, the proposed permits should cover in their description permission to use the whole unit, and no friction arising between the users because of rights claimed to any portion of the units should be considered as ground for a just complaint.

In the allotment of sheep-ranges it is evident that applications will come from owners who have small bands of sheep of 200 to 600 head each and on up to 1,200 head to the band. I anticipate that the small flock will be very much in evidence in British Columbia in the future, even in the range country. Where such a condition results the sheepmen will experience difficulty in securing herders for small bands unless they are willing to pay good wages. With a heavy expense in this way, the raising of sheep by those who would like to do so, but who cannot see their way owing to the expense, will be prevented. The Department should therefore encourage the runninng of co-operative bands.

This plan contemplates the setting-aside of adequate allotments for each band of approximately 1,200 ewes with lambs, and encouraging several owners to pool their flocks for the summer. The expense of the herding can then be shared on a *pro rata* basis, the sheep being divided in the fall when they leave the summer range and the losses shared proportionately. Each man can attend to the breeding, wintering, and lambing of his own sheep. In some instances the possibility of running co-operatively, except as to winter feeding, may appeal to the owners, the group owning the necessary rams. Many, of course, probably most of the growers, will prefer to run their sheep apart from others, in which case adequate individual allotments should be provided.

It will be found sheep-ranges must necessarily be set aside within units of ranges of which the majority of users are cattlemen. This can be successfully accomplished by confining the sheep to a distinct allotment, but allowing the cattle to graze over the entire unit, sheep-range and all. The sheepmen will be compensated for this drift by having an adequate allotment.

The sheep being herded can be confined to lines, but the cattle grazing loosely cannot, and it would not be advisable to put the cattlemen to the expense of herding to lines when it is not necessary.

Co-operation.

As stated before, proper management will require co-operation between the Government and the stockmen. Co-operation with individuals regarding individual allotments is brought about through the compilation and application of individual allotment plans.

Co-operation with groups of users, however, will depend upon their organization in an association, with an elected or appointed range committee or advisory board to manage the range in accordance with the suggestions and plans of the Department. The possibilities in this respect are remarkable, and are largely the basis for all progressive work expected to be accomplished in correcting evils in range-management and promoting the general welfare of the stock industry.

Surplus Summer Range.

While I have not yet had an opportunity to examine into this phase of the range question, I have reason to believe there exists in British Columbia very large areas of summer range for sheep in the higher Cascades and in the Rockies which local growers cannot hope to use with local-grown sheep.

It seems clear to me, therefore, that a large field is open to the local man who cares to go outside of the Province in the spring to buy sheep, shipping them in for summer grazing, and thence on to the local or Eastern markets in the fall. This phase of the sheep business has developed in other sections of the continent and will also develop here, and forage resources, which otherwise might be wasted, will be developed and put to profitable use.

Another line of profitable endeavour will develop in the purchase of sheep on the outside and the wintering of them on the heavy-producing hay lands and crops of the Province, and their marketing during the winter months or possibly after shearing in the spring. Many sheepmen who do not care for the expense and hazards of summer grazing on the range will follow this business, which can be made a very profitable one.

Private Lands.

In any system of allotment of the Crown lands the scattered nature of the unfenced private lands will be a factor to be considered. These lands are so numerous within the areas of range used by cattlemen in the more heavily stocked districts that in some cases only a fraction of the range unit is Crown land. This will necessitate a form of permit which may be designated the "on and off permit."

This permit would be issued where the applicant for range does or does not own or control through lease the unfenced private lands in the unit, and the owner of such lands does not object to his use of them. The permit as issued would give permission to graze so many cattle on a unit of range a certain percentage of which is Crown lands.

For example, the percentage of the Crown lands in the unit is fifty, and the applicant desires to graze 100 head of cattle. The permit as issued would cover fifty head of stock, for which he would pay the Government, but should contain a clause reading: "This permit allows the grazing of 100 head of cattle on range 50 per cent. of which is Crown land."

Where the applicant does not own or control the lands and objection is raised to the use of the private lands by the owner or a lessee, the clause would be discontinued and a straight paid permit for fifty head issued, the applicant and the party controlling the private lands settling the use of such lands among themselves without involving the Government.

In all cases where the lands involved are owned or leased by the applicant, the same clause may be included in the permit each season that evidence is filed to prove such ownership or control.

Areas of private lands suitable for grazing may be owned or controlled by an applicant who desires to graze his stock on range at a distance from that in which his private lands are located. If advisable, and he waives the exclusive use of it to the Government and agrees to its use by any one to whom the Government allots it, he could be given a free permit for the number of stock his private lands would carry and be allowed to graze them on an allotment of Crown lands in some other portion of the district, or on the range for which he makes application.

BURNING RANGE.

I have examined many portions of range with the end in view of determining the possibility of the improvement through burning. Many old and recent burns, particularly in lodge-pole pine areas near Clinton, have been examined, and my conclusions at this time are that it will be unwise to undertake severe burning for the purpose of removing the timber.

The stockmen, as a rule, hold the opinion that the lodge-pole or jack-pine areas should be burned, because, as they say, the stock will not eat the pine-grass, which is the principal forage-crop under the pines, and they believe that if the timber is burned the stand will improve on account of the range being more open and exposed and the old grasses, etc., removed. It is true that burning will improve the grass range if wisely done, but it is a mistake to assume that because the pine-grass is not used it is not palatable. It has been pointed out in this report why cattle prefer not to use pine-grass if bunch-grass and other sweeter grasses are available, and it has also been pointed out how cattle can be made to use the pine-grass.

There are very few areas of lodge-pole pine range which cattle are prevented from using on account of the density of the timber. As a general thing, it is not necessary to burn the timber to secure this use. If water is available, the use of salt will accomplish it.

It is clear to me, however, that intelligent burning will assist in a more vigorous growth of pine-grass through the ash-deposit and the removal of the humus with its humic-acid deposit. From a range view-point it destroys the small seedlings which grow and restrict grazing. All burning, however, should be light burning; that is, sufficient only to destroy the old grass without injuring its root system, and to destroy the small seedlings only. The larger trees will be left to grow, thinning themselves out in a natural way, the result being park-like areas of good grazing-grounds, affording the proper shade for cattle in the hot weather, as well as for the character of grasses and forage peculiar to the various lodge-pole or jack-pine ranges.

Indications are that light burning can be accomplished more readily in the early part of the year or about June or early July. It seems unwise, therefore, to consider at this time burning during portions of the year when conditions are such that severe fires will occur and destroy the trees, both large and small. Severe fires seem to destroy the root system of the grass very extensively, and while there is a spotted growth of grass following the fire, in a few years the dead trees fall in until there is an impassable mass of tree-trunks, necessitating a second and even a third burn to open the range again. It would appear useless to burn a second time until practically all dead trees are down.

Observations on second burns in most cases convinces me that severe fires promote the growth of brush, which in a few years grows beyond the reach of the grazing animals. If burning is to be undertaken, it should be light burning only and carried out at a season of the year when only the dead grasses and small seedlings will be destroyed.

It is proposed to burn an area of range north of Clinton next June or July to determine particularly what effect it will have on the growth of the kinnikinic. Instances have been noted where this plant is growing so abundantly that it appears to be having the effect of preventing the growth of palatable forage. White clover and some tame grasses will be sown on a portion of the burn as an experiment.

An area in a 1917 burn near the 59-Mile House was sown with pine-grass to determine the fertility of the soil after a severe fire which in places appeared to destroy all vegetation.

The following tame grasses were sown by Ranger Geo. H. Stevenson on areas of the zone of the 51-Mile fire: Brome-grass and cocksfoot.

It is planned to totally protect portions of these areas to determine the effect of total protection from grazing as compared with the effect of grazing on other portions, and also to find out what will be the result in choking out the tame grasses, if any, by the native herbage under conditions attending total protection, as well as grazing.

Some bunch-grass was sown on a sample area on the Hamilton Commonage as an experiment, and a sample plot was fenced on the Lumdum Commonage to determine the rapidity of recovery of bunch-grass on the most denuded areas of that range.

COYOTE MENACE.

A few of the sheepmen have complained to me that the coyote was a great menace, and that some measure in the way of putting on Government hunters and trappers should be adopted to cope with the evil. Others do not seem to think the coyote is to be greatly feared or to be

considered as an influence sufficient to deter one from entering the sheep business. It is apparent that the man who runs a few sheep or small flock on his ranch and those who use the open range with poor herders in charge are the sufferers. The former does not realize that sheep cannot be allowed to graze under inadequate fences practically without protection in a country where coyotes abound without loss occurring. In such cases the coyote soon becomes familiar with the surroundings and practises on the range and kills sheep whenever he needs a meal. In the latter, careless herding and the bedding of the sheep too long on the same bed-ground is responsible for the loss.

The farm flock should be under a good, well-kept, woven-wire fence. A barbed wire strung along the ground will be very effective in preventing the coyote from digging under the fence. On the range, coyotes can be kept from the sheep if a few shots are fired around the bands during the day and bed-grounds are not established too long at the one place.

I have, etc.,

Thos. P. MacKenzie,

Commissioner of Grazing.

REPORT OF THE SUPERINTENDENT OF BRITISH COLUMBIA SOLDIER SETTLEMENT.

February 24th, 1919.

The Honourable the Minister of Lands,
Victoria, B.C.

Sir,—I have the honour to submit herewith my report of the administration under the "Soldiers' Land Act," being chapter 80 of the Statutes of British Columbia for the year 1918, as required by section 6 thereof. The above Act was assented to on April 23rd, 1918, and my appointment as Superintendent of British Columbia Soldier Settlement dates from September 26th, 1918, approved by Order in Council dated October 8th, 1918, notice of which appeared in the British Columbia Gazette on February 27th, 1919.

Below follows a summary of proceedings under the Act previous to my appointment:—

(1.) By Order in Council approved on June 8th, 1918, and notice appearing in the British Columbia Gazette on June 13th, 1918, the reserve on land covered by Expired Timber Licence No. 33923, situate at Porpoise Bay, near Sechelt, which is about thirty-five miles from Vancouver, which had been subdivided as Lots 4679, 4680, 4681, 4682, 4683, 4684, 4685, 4686, 4687, 4689, and 4690, Group 1, New Westminster District, consisting of eleven parcels ranging in size from about 40 to 60 acres, was cancelled for the purpose of making the same available for soldier settlement. Applications were received between the 14th and 21st days of August, and the allotment of the lands was made on August 29th by drawing. There were twenty-two applicants for this land and eleven records were granted to returned soldiers.

(2.) By Order in Council approved on June 19th, 1918, and notice appearing in the British Columbia Gazette under date of June 26th, 1918, the reserve on land covered by Expired Timber Licence No. 34578, situate at Agamemnon Bay, which is about sixty-five miles from Vancouver and about nine miles from Pender Harbour, which had been subdivided as Lots 4584, 4585, 4586, 4587, 4588, 4589, and 4590, New Westminster District, consisting of seven parcels averaging in size about 40 acres, was cancelled for the purpose of making the same available for soldier settlement. Five applications were received in respect of Lot 4584 and two applications in respect of Lot 4585. No applications were received for the remaining lots, and at the present time the only lot covered by record is Lot 4584.

The requirements as to residence and improvements in connection with these lots were the same as the pre-emption regulations under the "Land Act," except that no fees were charged or will be charged and the land is exempt from taxation under the "Taxation Act" for a period of five years from the date of the record.

While not directly under the "Soldiers' Land Act," an Order in Council was approved on June 26th, 1918, and notice appeared in the British Columbia Gazette on June 27th, 1918, providing that no fees chargeable under the "Land Act" would be collected in respect of a pre-emption record issued under the "Land Act" to a returned soldier as defined by the "Soldiers' Land Act," and also that the land covered by the record should be exempt from

taxes under the "Taxation Act" for a period of five years from the date of the record. This Order in Council is being ratified by an amendment to the "Land Act" now before the Legislature.

It may be noted in this connection that by Order in Council approved on June 4th, 1918, the interest due the Crown in respect of an agreement to purchase town lots held by a person on active service is waived from the date of his enlistment to a date one year after the date of his discharge. This Order in Council is also being ratified by an amendment to the "Land Act" now before the Legislature.

(3.) By Order in Council approved on June 17th, 1918, and notice appearing in the British Columbia Gazette under date of June 27th, 1918, Lots 1346, 1347, 1348, 1349, 2909, and 2910, Kamloops Division of Yale District, comprising an area of approximately 3,800 acres, were reserved for the purposes of the "Soldiers' Land Act." These lands have not yet been opened for soldier settlement and are held pending the completion of survey and the collection of certain data in connection with them.

(4.) By Order in Council approved on August 7th, 1918, and notice appearing in the British Columbia Gazette under date of February 27th, 1919, an area of land situate at the south end of Stuart Lake and extending along the Stuart River was reserved or set aside for settlement by returned soldiers. This land was resurveyed into areas of approximately 160 acres each and comprises a total area of 61,276 acres, being 39,982 acres of first-class land, 16,512 second-class land, and 2,900 acres which has been rated as third-class, also 1,882 muskeg land. The report of the surveyor who performed these surveys is included in the report of the Survey Branch and is published on page 72.

The administration or opening to settlement of these lands is being held in abeyance pending the reaching of a satisfactory agreement between the Province and the Dominion Government in respect of loans to the soldier settlers. It may be that it will be found more advantageous to the soldiers to have this land transferred to the Dominion Government under the authority of the "Soldiers' Land Act," and administered by them through their Soldier Settlement Board. It will, of course, be impossible to complete these arrangements until after the proposed Dominion Legislation becomes law.

Several other areas in different parts of the Province at present under reserve have been examined and are in the process of being examined. With particular reference to logged-off and expired timber licences which have already been subdivided, there are approximately 200 such parcels situate in the Coast districts which will be thrown open for entry in the near future, and the applications of returned soldiers will have preference. Preference is given to the applications of returned soldiers for all lands that are now thrown open for pre-emption entry.

Since my appointment the Government has:—

(1.) By Order in Council approved December 23rd, 1918, and notice appearing in the British Columbia Gazette under date of January 16th, 1919, this Government has acquired from the South Okanagan Land Company, Limited, some 22,000 acres of land situate along the Okanagan River, extending from a point sixteen miles south of Penticton on both sides of the river to the boundary-line, and having an average of two miles in width. This land is acquired with the object of making all or a portion of it available for settlement by returned soldiers.

Owing to the large extent of preparatory work that is necessary in the way of subdividing, building of roads, installing an irrigation system, soil examination and analysis to determine the suitability of various parts of it for different undertakings, it will most likely be the spring of 1920 before it is possible to open this land for settlement. Needless to say, the work of examination and survey is being proceeded with as rapidly as possible under the supervision of the Consulting Engineer of the Lands Department. Returned soldiers are given the preference in employment in connection with all work under the project.

By Order in Council approved on December 14th, 1918, and notice appearing in the British Columbia Gazette under date of December 19th, 1918, Lots 71 and 72, Group 1, New Westminster District, containing 300 acres and situate near Burnaby, were reserved under the "Soldiers' Land Act." The preparation of this land includes the clearing and subdividing, and is receiving the attention of the Department at the present time with a view to making it available in lots of a suitable size for returned soldiers.

While section 6 of the "Soldiers' Land Act" calls for a report of the operations under the Act for the calendar year only, it is worthy of note that:—

(2.) Under Order in Council approved on January 8th, 1919, and notice appearing in the British Columbia Gazette under date of January 16th, 1919, the Government purchased under the "Soldiers' Land Act" from the Municipality of South Vancouver some fifty lots which had reverted to the municipality for non-payment of taxes, for the purpose of providing free homesites and to erect dwellings for returned soldiers, in connection with which, by Order in Council approved on January 13th, 1919, and notice appearing in the British Columbia Gazette on January 23rd, 1919, the following regulations were approved:—

Rules and Regulations Governing the Granting of Homesites and the Building of Dwellings for Returned Soldiers.

1. "Homesites" are residential lots not less titish Columbia soldiers who follow industrial occupurpose of affording free homesites to returned Br also to the dependents of those who have been pations in or near existing centres of industry, andhan 50' x 120' which have been acquired for the killed and to returned soldiers who have been disabled.

2. For the purpose of these rules and regulations the interpretation of "soldier" shall be as set out in subsections (*a*) and (*b*) of section 2 of chapter 80, Statutes of British Columbia for 1918, being the "Soldiers' Land Act."

3. The allotment of homesites shall be made by drawing in a manner to be determined by the Minister of Lands; but priority will be given to the applications of widows and disabled returned soldiers according to the degree of disability or dependents of soldiers who have died in or on account of their service, according to degree of dependency.

4. Each applicant for a homesite shall deposit with his application a fee of $10, which fee should the applicant be successful, will be credited to the first deposit when the contract or agreement is signed, or forfeited should the applicant fail to comply with or enter into the agreement.

5. Should an application for a homesite be refused for any reason the fees paid in connection herewith shall be promptly returned to the applicant.

6. Dwellings of a maximum value of $2,000 will be built on a plan to be selected by the soldier from the approved plans of the Department of Lands on each homesite upon the entering into of a contract or agreement by the successful applicant and the payment of $50 less the $10 already paid as a first deposit, for the payment of the balance by monthly payments as amortized in accordance with the table of the Department of Lands. The said table is based on 5 per cent. interest per annum and a 10 per cent. administrative charge added spread over 20 years. A large initial payment or deposit may be made or any number of instalments of the principal at any monthly date. Should any soldier settler desire to erect a dwelling exceeding $2,000 in value he may do so upon having the plans thereof approved by the Minister of Lands, but the cost of such dwelling in excess of $2,000 shall be met by the soldier settler, the equity of the Government remaining as a first charge against the property.

Facilities will be afforded men possessing the necessary ability to do the individual work themselves under supervision.

7. The first deposit shall be payable within three months from the date of the allotment of the homesite.

8. The soldier settler shall enter into occupation of the dwelling and commence the monthly payments as set out in clause (6) of these regulations on a date not less than thirty (30) clear days after the date of mailing or delivering to him a notice in writing that the dwelling is ready for occupation.

9. When the purchaser has made such payments as shall leave a balance due to the Government equal to the amount charged for the homesite, exclusive of the dwelling, such balance shall be rebated to the purchaser, provided that ten years' residence has been met and all other conditions have been complied with.

10. All dwellings erected on "homesites" shall be insured by the Department of Lands.

The soldier settler shall pay each month in addition to the payment under the amortization table an amount equal to one-twelfth of the premium of the policy or proportion of the policy, as the case may be, insuring his dwelling.

11. Occupation by the settler, personally or by his family, shall constitute residence. Leave of absence may be obtained on application to the Minister of Lands. Two months' absence without the Minister's approval will constitute forfeiture, and all payments theretofore made shall be deemed to be rental paid for occupancy.

12. If it becomes necessary for the settler to move before the contract or agreement has been completed, he may for sufficient reason be permitted to dispose of such land on obtaining the consent of the Minister of Lands. When any homesite is so resold by the Government to another soldier settler the time of residence of the preceding purchaser may in the discretion of the Minister be credited to the subsequent purchaser.

If a sale be made of the said property to any other than a soldier settler the balance remaining unpaid to the Government shall be paid by the purchaser on such terms as may be decided upon by the Minister of Lands, provided that the first payment shall be not less than 25 per cent. of the balance remaining unpaid.

13. Non-compliance with any of the above regulations will forfeit all claim to the property, but the Minister of Lands is hereby empowered to grant such extensions of time for payments as may in his

discretion seem just, and to grant reasonable requests for removal, exchange, or withdrawal according to the merits of each particular case, and to make such disposal or settlement as may be deemed just and equitable.

14. The agreement may contain such other terms and conditions as are considered necessary.

15. Such forms as may be necessary for the information of intending applicants and the proper carrying out of these regulations shall be prepared under the direction of the Minister of Lands.

The following are given as examples of payments:—

Example—House, $1,700, less $50=$1,650. Annual payment, $132.40, or $11.04 per month. Ten per cent. administrative charge=$170, or $8.50 yearly or 71 cents monthly.

End of	Repayment of Principal.	Interest.	Repayment of Principal.
1 year	$ 49 90	$ 82 50	$1,600 10
2 „	52 40	80 00	1,547 70
3 „	55 02	77 38	1,492 68
4 „	57 77	74 63	1,434 91
5 „	60 66	71 74	1,374 25

20 „	139 18	6 86	*Nil.*
	$1,820 00	$1,100 76	.....

Amortized payment	$12 17
Administration	78
Total monthly payment	$12 95

These homesites were opened to application for two weeks previous to February 10th, 1919, at the office of the Government Agent at Vancouver, and on February 20th homesites (double lots) were allotted to fourteen applicants. As soon as possible after the plans are selected, construction of the dwellings will proceed under the direction of the Public Works Department.

While not under the jurisdiction or administration of the "Soldiers' Land Act," the following items should be noted in this report:—

(*a.*) Lands in the settlement areas in the Bulkley and Nechako Valleys have been opened for sale by the Land Settlement Board, and in the case of the purchaser being a returned soldier he is allowed a rebate of $500 on the purchase price. Up to the present eight parcels in the Bulkley and five in the Nechako have been purchased by returned soldiers.

(*b.*) Pre-emption records issued under the "Land Act" to returned soldiers since September 1st to date are as follows:—

Land Recording Division—

Ashcroft	1
Clinton	1
Fairview	2
Fort Fraser	1
Fort George	2
Hazelton	2
Kamloops	2
Nanaimo	1
Prince Rupert	2
Quesnel	1
Vancouver	19
Total	34

(*c.*) Under the "Pre-emptors' Free Grants Act" and amendments, 248 free Crown grants of their respective pre-emptions have been issued to returned soldiers.

(*d.*) Under the "Relief Act," which is administered by the Department of Lands, on receipt of an application for relief in respect of the fees of a coal and petroleum licence or lease in the name of a man on active service I find it is the practice to recommend to the Executive Council that all fees in connection therewith be stood over for a period ending six months after the end of the present war.

(*e.*) Under the "Forest Act Relief Act," administered by the Forest Branch, a man on active service is exempt from the payment of annual fees on timber licences until six months after the end of the present war, when payment without interest or penalties is to be made.

In the amendments proposed this year it is provided that the back payments can be made in instalments beginning on the first annual renewal date six months after the termination of the present war.

I wish to extend my best thanks to my staff, which is composed of an assistant (J. Mavor, a previous official in the Lands Department, recently returned from France) and two stenographers.

I have, etc.,

J. W. CLARK,

Superintendent, B.C. Soldier Settlement.

REPORT OF THE SURVEYOR-GENERAL.

The Hon. T. D. Pattullo,
Minister of Lands, Victoria, B.C.

SIR,—I have the honour to submit the following report of the Survey Branch of the Department of Lands for the year ending December 31st, 1918:—

The appropriation for Crown land surveys for the current year was $70,000, being lower than that for any year since 1907. In consequence it has been necessary to further curtail field operations and to confine the work to only the most necessary surveys.

As in the previous year, the greater portion of the field-work was confined to the survey of lands already held under pre-emption record. Among these are included records held by men in military service, who will be entitled, on discharge from the army, to free grants under the provisions of the "Pre-emptors' Free Grants Act." As the amendment to the "Land Act" of 1918 has abolished the pre-emption of unsurveyed land, it has been possible to survey this year a large proportion of the unsurveyed land held under pre-emption record, and in another year it will probably be possible to survey practically all such lands, which are more or less close to transportation, leaving only the isolated parcels which the Department does not propose to survey, and the owners of which will necessarily be required to have surveyed by private arrangement with the surveyor. It will be seen, therefore, that with practically all timber licences and pre-emptions surveyed and outstanding applications to purchase cancelled, there should be at the end of 1919 very few unsurveyed alienations on record in the Department.

This condition will considerably facilitate the administration of Crown lands, and avoid many complications due to conflicting interests which this Department has been called upon to deal with in the past.

The work of triangulating and traversing portions of the coast-line has also been continued. This work was commenced in 1916 and continued in 1917 and 1918, on account of the numerous applications for timber-sales and hand-logger licences along the Coast. The Admiralty charts which constituted practically the only information available with regard to the greater portion of the coast-line were found to be in many instances not sufficiently reliable for our purposes. The fact that the end of a large inlet was found this year to be about twelve miles out of place on the chart is quoted as an example of the necessity for this work. The work in the field consists of triangulations between points on opposite sides of inlets and tying in the corners of existing surveys. Where triangulations are impracticable, stadia traverses are resorted to. While this method does not give accurate details as to the sinuosities of the shore-lines, it is sufficient for our purposes, and has the advantage of furnishing the greatest amount of necessary information at a minimum cost.

The scheme of continuity in this work prepared in the spring was unfortunately interfered with to some extent by a drowning accident, in which J. E. Laverock, B.C.L.S., in charge of a party, and one of his assistants, J. Griffiths, lost their lives in Dean Channel.

Mr. Laverock and Mr. Griffiths were last seen on August 31st, on their way from Ocean Falls to the survey camp, and it is presumed that their boat was overturned in the storm which prevailed on the Coast that day. Mr. Laverock had been employed on Government work annually for several years, and his field-work and returns were always highly satisfactory. It is felt that his unfortunate and untimely death has removed one of the most efficient men of his profession in the Province.

Specially reserved lands for returned soldier settlement were surveyed in the vicinity of Merritt and at Stuart Lake. In the former locality twelve parcels containing 1,770 acres were surveyed. At Stuart Lake a large area of lands which reverted to the Crown under the provisions of the "Soldiers' Homestead Act" were subdivided into parcels of 160 acres approximately. About 61,000 acres of land were thus made available for soldier settlement. Detailed reports on these areas will be available in due course.

The surveys for the year include 283 parcels under pre-emption record, 68 parcels of Crown land, and 387 miles of coast-line traverse.

This must be considered satisfactory considering the adverse conditions prevailing during the season, such as the unusually wet weather in July in certain portions of the Province, the difficulty in obtaining competent and experienced labour, and the necessity of a large amount of moving from one piece of work to another.

The following is a summary of the field operations carried out during the season in the various portions of the Province:—

CENTRAL AND NORTHERN INTERIOR.

For the purposes of this report the Central and Northern Interior are defined as that portion of the Province lying north of the Dominion Government Railway Belt and east of the Cascade range of mountains. Ten surveyors were employed in this portion of the Province in the localities indicated:—

A. J. Campbell .....Swan Lake, Peace River District.
H. C. Black .....Rose Lake, Coast District, Range 5.
F. P. Burden .....Moose Springs, Cariboo District.
R. W. Haggen .....Fraser River Valley, between Quesnel and Chimney Creek, Cariboo District.
F. Butterfield .....Horsefly River and Quesnel Lake, Cariboo District.
F. Tupper .....North-western Lillooet District.
W. S. Drewry .....Eastern Lillooet District.
G. S. Boulton .....Anderson and Seton Lakes, Lillooet District.
W. G. McElhanney .....Upper North Thompson River, Kamloops District.
J. E. Ross .....Lower North Thompson River, Kamloops District.

SOUTHERN INTERIOR.

In that portion of the Province lying south of the Canadian Pacific main line of railway five parties were employed, as follows:—

F. H. Latimer .....White Valley, Osoyoos District.
B. A. Moorhouse .....Vicinity of Summerland, Osoyoos District.
C. A. E. Shaw .....Vicinity of Fairview, Similkameen District.
O. B. N. Wilkie .....Vicinity of Merritt, Kamloops District.
P. W. Gregory .....Vicinity of Princeton, Kamloops District.

Practically all the arable lands in this portion of the Province have been surveyed. The work this year consisted principally of the survey of pre-emptions located on the outskirts of the valleys, and while they contain some land which can be brought under cultivation, the majority of them contain a large proportion of high bench or more or less steep hillside. Being situated in the Dry Belt and, generally speaking, at too great an elevation for irrigation, these pre-emptions are generally conceded to be suitable only for the raising of a limited amount of stock, commensurate with the amount of winter feed which the pre-emptor may be able to grow in those portions of his land which can be cultivated, and possibly, if fortunate enough in location, augmented by wild meadow-hay.

Mr. Wilkie also surveyed into suitable parcels some lands a short distance south-west of Merritt, which have been reserved for returned soldier settlement.

MAINLAND COAST.

Five surveyors were employed on the Coast between Vancouver and Prince Rupert, as follows:—

H. H. Roberts.....Cortes and Redonda Islands, etc., New Westminster and Coast Districts.
Jno. Elliott.....Queen Charlotte Sound, Coast District, Range 2.
C. C. Smith.....Rivers Inlet and Burke Channel, Coast District, Ranges 2 and 3.
J. E. Laverock.....Dean Channel, Coast District, Range 3.
A. E. Wright.....Cumshewa Inlet, Queen Charlotte Islands District, and Roscoe Inlet, Coast District, Range 4.

Mr. Roberts's work consisted mainly of pre-emption surveys, and Mr. Elliott surveyed a few pre-emptions at Blunden Harbour after traversing the north shore of Queen Charlotte Sound

from where he left off work last year to a point where a previous traverse had been carried to from the North.

Messrs. Smith, Laverock, and Wright were employed exclusively on triangulation and the traverse-work in various inlets, and considerable progress was made on this work.

MISCELLANEOUS SURVEYS.

L. S. Cokely was employed on small scattered surveys on Vancouver Island, the Lower Mainland, and Gulf Islands.

TOPOGRAPHICAL SURVEYS.

The photo-topographical survey of the Okanagan Lake basin, which was completed in 1917, was this year extended to cover the eastern watershed of Okanagan River between Penticton and the International Boundary, including the greater portion of the lands recently purchased by the Crown for development with a view to soldier settlement. An area of about 325 square miles was covered and the mapping of this work is now being proceeded with. R. D. McCaw has, as in former years, been in charge of this work.

ALBERTA-BRITISH COLUMBIA BOUNDARY.

The Commission appointed in 1913 for the definition of the boundary between the Provinces of Alberta and British Columbia continued operations during the year; A. O. Wheeler, the British Columbia Commissioner, working in the vicinity of Howse Pass, and Mr. Cautley, representing both the Alberta and Dominion Governments, established a portion of the 120th meridian of longitude in the vicinity of Swan Lake, Peace River District.

The report of the Commission for the survey of that portion of the boundary between Kicking Horse Pass and the International Boundary was published during past years, having been prepared under the direct supervision of the Surveyor-General of Dominion Lands at Ottawa.

SURVEYOR'S REPORTS.

The general reports of the various surveyors employed during the season are appended to this report.

PRIVATE SURVEYS.

Surveys of Crown lands made at the instance of and paid for by private parties, such as surveys of pre-emptions, applications to purchase or lease, coal licences, timber licences, mineral claims, etc., are known departmentally as "private surveys." There has been a decrease in surveys of this nature from year to year since 1912, and the past season shows a decrease from 1917 in all classes of this nature, with the exception of mineral-claim surveys, which again show a small increase.

With reference to timber-licence surveys, the Statute provides that all licences must be surveyed by November 30th, 1919, leaving only one surveying season for the survey of the remaining unsurveyed licences. According to the Chief Draughtsman's report, there are 3,006 licences reinstatable under the "Forest Act" and amending Acts, and which are still unsurveyed. It is anticipated, however, that only a comparatively small fraction of these are likely to be surveyed, as a large number are known to be of no value as timber holdings owing to faulty location by the original applicants.

OFFICE-WORK.

The details of the work of the office are covered by the report of the Chief Draughtsman submitted herewith.

The organization of the staff has been maintained with very few changes during the year. The end of the war and the return of those members of the staff who have been serving in the Army will, however, necessitate some changes and reorganization during the coming year. It is gratifying to know that of the twenty-three members of this staff who enlisted, not one was called to pay the supreme sacrifice, and only four or five, as far as known at present, have been casualties.

Enlistments during the war almost depleted the staff formerly employed on geographic work, and only two men have been available for mapping during the past two years. However, as the demand for maps fell off somewhat during the war and as less field-work was being done, it has been possible to fill the most urgent requirements in this connection. Many of our maps

are now, however, getting out of date and out of print, and with the return of peace and increasing demand for maps of all descriptions it will be necessary to again increase our facilities for map production.

The most important map completed during the year is one of the northerly portion of Vancouver Island, which is now in the hands of the printers and will be available for distribution shortly. This map, on the scale of four miles to an inch, will show all surveys as well as geographic information, and will include a large portion of the Mainland adjacent to this portion of Vancouver Island, as well as the intervening smaller islands.

It will fill a long-felt want, as the area covered has hitherto been only more or less indifferently mapped. It is hoped also to republish shortly a new edition of the map of southerly Vancouver Island, published in 1913. On the completion of this work the mapping requirements as far as Vancouver Island is concerned should be satisfied for some years to come.

GENERAL.

In my report for the year ending December 31st, 1917, I ventured to predict that the work of the Branch would show a considerable increase during 1918. While the statistics would appear to show that this prediction has not eventuated to any appreciable extent as far as the routine work of the office is concerned, the special work of various natures dealt with during the year would indicate considerable expansion, which will be reflected in the next annual report of this Branch.

The recent successful conclusion of the great world war prompts me to here pay a tribute to the part played by British Columbia land surveyors in the great military struggle. According to available information, 122 surveyors enlisted for overseas service during the war. Of these, twenty-three have laid down their lives, two have been prisoners in Germany for about three years, and many others will return with wound stripes.

The rapid promotion of many of these men, in some instances from the ranks, is evidence that the contribution of the profession of land surveying from British Columbia to the nation's cause was one of quality as well as quantity.

I have the honour to be,
Sir,
Your obedient servant,
J. E. UMBACH,
Surveyor-General.

REPORT OF THE CHIEF DRAUGHTSMAN.

December 31st, 1918.

J. E. Umbach, Esq.,
Surveyor-General, Victoria, B.C.

SIR,—I have the honour to submit the following report on the work of the Survey Branch for the year ending December 31st, 1918:—

OFFICE-WORK.

The general work carried out has been similar to that done in previous years, while the volume of work handled has been about the same as that in 1917. At the present date the staff numbers twenty-eight in all. During the year three men resigned and one man enlisted. A returned soldier formerly in the Department was taken on the staff and one junior was appointed.

FIELD-NOTES.

During the year 762 field-books were received, containing notes for 766 lots. During the same period 1,346 lots were plotted and gazetted. Tracings of these lots were prepared and forwarded to the Government Agents in whose districts they were located.

The following table gives an analysis of the acreages of the various kinds of surveys gazetted during the year:—

	Acres.
Pre-emption surveys	10,835
Purchase surveys	1,634
Mineral-claim surveys	9,247
Timber-licence surveys	223,768
Coal-licence surveys	953
Lease surveys	2,342
Government surveys	60,311
Total	309,090

A comparison of these figures with those of previous years, as far back as 1900, may be found by reference to Table A attached to this report. It will be noted that there has been a fair increase over the year 1917 in the number of mineral surveys dealt with.

Table B attached to this report shows that proportion of Government surveys made in relation to the total land surveys for each year since 1900.

Timber Surveys.

Field-notes covering the survey of 296 licences were received during the year, as compared with 424 during 1917. It is estimated that of the timber licences in good standing, or renewable under the Statute, 10,687 have been surveyed, leaving 3,006 still unsurveyed.

Railway Plans.

During the year plans covering 290 miles of railway right-of-way have been finally dealt with and cleared for Crown-granting purposes.

Clearances.

As in previous years, clearance reports have been furnished by this Branch on all applications for lands dealt with by the Lands Department. These include 823 applications for pre-emptions and 12 applications to purchase. The corresponding figures for 1917 were 822 and 19 respectively. These applications, together with those dealt with by the Forest Branch, including 226 timber-sales, are all plotted and noted on the departmental reference maps. Suitable notations are also made on these maps as to the cancellation of pre-emptions, applications to purchase, timber-sales, etc.

Departmental Reference Maps.

The work of keeping these maps up to date and compiling new ones has been proceeded with as heretofore. Ten maps were recompiled and drawn on projection, while one was retraced. The method of compiling these maps on projection enables the joining-up of adjacent maps to be made correctly, and avoids overlapping and at the same time adds greater accuracy to the map itself.

Information supplied to Surveyors and others.

A nominal charge is made for the preparation of copies of field-notes, blue-prints, etc., required by surveyors and others. The revenue derived from this source amounts to $1,479.82, as compared with $1,327 for 1917. This work entailed the copying of 150 sets of field-notes, 1,171 tracings, and 950 letters.

The following is a statement of the number of blue-prints made:—

Mail and counter orders	1,496
Surveyor-General's Branch	1,400
Forest Branch	6,425
Other branches of Government service	6,795
Sundry	2,210
Total	18,326

There were also prepared 1,512 tracings (in duplicate) to be attached to Crown grants, and 84 tracings (in duplicate) to accompany land leases.

CORRESPONDENCE AND ACCOUNTS.

During the year 2,465 letters were received and 2,350 sent out, which does not include interdepartmental memoranda.

Accounts amounting to $75,038.47 have been checked and dealt with by the Accountant.

Table C attached to this report gives a summary of the office-work for the year 1918 and comparative figures for 1917.

WORK DONE FOR THE WATER RIGHTS BRANCH.

The chief work done in this connection includes the clearance of 257 applications, the preparation of plats for 334 conditional licences, and 633 Board orders. In addition, 30 revised water-rights maps have been redrawn and a new set of reference maps statused to show all the water reserves, water rights, and miscellaneous applications.

WORK DONE FOR THE FOREST BRANCH.

The general draughting-work for this Branch has occupied practically the whole time of one draughtsman. The chief work done has been in connection with aeroplane-spruce permits, and has included more or less clerical work. In addition, a portion of the draughtsman's time has been occupied in the compilation of 40-chain-to-the-inch maps for the use of the Grazing Commissioner.

GENERAL.

In addition to the above, the preparation of instructions for both Government and private surveys, including the copying of information from official records, forms a considerable portion of the work of this office.

As in previous years, the staff has also been called upon to attend to various draughting-work for other departments of the Government.

During the year a "photostat" was installed in the Department, which enables the reproduction in facsimile of all kinds of plans, field-notes, documents, etc., and is available for work of this nature for all departments.

The limit of size of prints is 18 x 22 inches. The limit of enlargement is about 2 to 1, and the limit of reduction is governed only by the nature of the original. The machine turns out copies with the work in white on a black background. By a second operation the work comes out black on a white background.

In connection with the above machine, it was found necessary to construct a dark room, which room is available for other work of a photographical nature, and it has been found possible to make enlargements of the photographs taken in connection with the photo-topographical survey carried out during the year. These enlargements were formerly made elsewhere at a considerably greater expense.

The work in connection with this machine occupies practically the whole time of one of the members of the staff, and after its utility becomes more generally recognized it will no doubt require the undivided services of one man.

GEOGRAPHIC SUB-BRANCH.

As in 1917, only two draughtsmen have been available for the compilation and preparation of maps for reproduction by lithography during the past year. Only one map was actually published during the year—namely No. 3E, known as the "Peace River Pre-emption Sheet."

The compilation of Map No. 2C, "Northerly Vancouver Island," was completed and is now in the hands of the printer.

Corrections to Map 2A, "Southerly Vancouver Island," were made, and it is hoped to republish this map very shortly.

A reissue of Map 3L, "Graham Island, Queen Charlotte Islands Pre-emption Sheet," is also in the hands of the printer.

Sketch-maps for the preparation of blocks were also prepared for the Mines Department and Lands Settlement Board. In addition, the above Branch supervised the publication of a small map of British Columbia to accompany Bulletin No. 23.

Of the various lithograph maps available for distribution by this Department, some 14,726 were issued during the past year.

A list of lithograph maps and a list of departmental reference maps are attached to this report as Tables D and E respectively.

I have, etc.,
F. O. MORRIS,
Chief Draughtsman.

APPENDIX TO REPORT OF CHIEF DRAUGHTSMAN.

TABLE A.—SHOWING ACREAGES OF EACH CLASS OF SURVEYS GAZETTED EACH YEAR SINCE 1900.

Year.	Pre-emptions.	Purchases.	Mineral Claims.	Timber Limits.	Coal Licences.	Leases.	B.C. Govt. Surveys.	Totals.
	Acres.	Acres.	Acres.	Acres.	Acres.	Acres.	Acres.	Acres.

NOTE.—These reference maps show lands alienated and applied for, "Timber Limits," "Coal Licences," etc., surveyed and unsurveyed. They are compiled from all available data and are constantly being amended, and their accuracy is therefore not guaranteed. They were prepared originally for departmental use, and, having proved of value to the public, blue-prints of same are now on sale.

Victoria, January 1st, 1919.

VICINITY OF SWAN LAKE, PEACE RIVER DISTRICT.

By A. J. Campbell.

December 30th, 1918.

J. E. Umbach, Esq.,
Surveyor-General, Victoria, B.C.

Sir,—In accordance with your instructions, I proceeded to the Peace River District by way of Edmonton and Grande Prairie. The longitude of a point near Pouce Coupe, in the Peace River Block, had been determined in 1917 by telegraphic observations. From this point R. W. Cautley, D.L.S., of the Interprovincial Boundary Commission, located the position of the 120th meridian. He produced this meridian south, past Townships 25 and 26, of the British Columbia surveys in that district. This position of the 120th meridian, which is the east boundary of British Columbia, lay between 18 and 19 chains east of the east boundaries of Townships 25 and 26. These had formerly been known as the British Columbia boundary. Thus this strip of land was added to the Province. My instructions were to survey this strip into lots and also to complete the survey of Townships 26 and 27.

We left Grande Prairie with an incomplete party in the hopes of being able to obtain men from among the settlers around Swan Lake. Men were secured and the work was proceeding with the greatest possible dispatch, when a member of the party was taken ill with the Spanish influenza. This dread disease spread through the party until, finally, every member except one was either down with it or convalescing from it. I was thus compelled to cease operations with the work allotted to me in an incomplete state.

The country in the vicinity of Swan Lake is rolling, with long even slopes. From Swan Lake, which lies in the northerly part of Township 26, a long gentle slope rises to the south boundary of the township. This elevation holds, generally, through Township 27 in a gently rolling series of low hills, practically all of which could be put under cultivation. A few small creeks of good water were found, and these probably contain running water throughout the year. Several dry creek-beds were crossed.

The district is served by a good wagon and motor road from Grande Prairie, which is the present terminus of the Edmonton, Dunvegan & British Columbia Railroad. This road enters into British Columbia from Alberta in the southerly part of Township 26, passing to the south of Swan Lake, at a distance of approximately seventy-two miles from Grande Prairie, and follows on to Pouce Coupe, in the Peace River Block, which is about eighteen miles from Swan Lake. The main line of travel serving Pouce Coupe and Swan Lake Districts is along this road. Railroad surveys have been made from Grande Prairie, and it is possible that the district will have the advantages of the railroad before many years. From Spirit River to Pouce Coupe the Edmonton, Dunvegan & British Columbia Railroad has a line partially constructed. The great hope of the settlers in the vicinity is that the railroad surveyed from Fort George to Pouce Coupe will be constructed in the near future. This will bring the district into very much closer relation with the Province to which it belongs.

There is a weekly mail service from Grande Prairie to Pouce Coupe, which is the nearest post-office. It is possible that a post-office will be established in the vicinity of Swan Lake at an early date. The settlers generally have an arrangement with the driver of the stage to leave their mail at their residences or at some convenient point along the route. A Government telegraph-line follows along the road from Grande Prairie to Pouce Coupe, which is the nearest telegraph-office. At present the closest connection to the outside markets for the disposal of grain, cattle, etc., is by way of Grande Prairie, but it is very possible that before long settlers will be able to dispose of their produce without the disadvantage of such a long haul.

The soil generally is a rich loam over clay or sandy clay subsoil. In places that have been visited by several forest fires the surface soil has been burnt to the clay or sand, but in time such places will return to their original condition, due to the extremely heavy growth of rich grasses and peavine. The district is primarily a cattle country. Good grasses, peavine, and vetch grow luxuriantly. The cattle run out through the winter, but of necessity require to be fed through the midwinter months. Two tons of hay per head of stock is considered sufficient. Garden produce, such as potatoes, turnips, parsnips, cabbage, etc., of an exceedingly good quality can be grown. While up to the present not much has been done with grains in the immediate vicinity, there is no doubt that wheat and oats can be raised with great success. The Pouce

Coupe District, which is subject to practically the same climatic conditions, is becoming famed for its yields of grain.

The greater part of the district under discussion is covered by small poplar and willow-brush more or less dense. Considerable open stretches are found in the neighbourhood of the road and Swan Lake. Some spruce and tamarack of good size grows on the north of the lake. To the south through Township 27 the growth becomes more dense, thick willow, and in places alder-brush is seen. In the southerly part of this township there is larger timber in clumps and in stretches along ridges and low-lying lands. Jack-pine, spruce, and poplar to a diameter of 18 inches, with an average of 6 to 8 inches, is found in these places. There is exceedingly thick windfall in this part. The country has all suffered from forest fires and in places has been burnt over several times. In these the old growth has completely vanished and a new growth of small poplar and willow has sprung up.

As we went into the country in the fall of the year, I am not in a position to speak from a personal observation concerning the rainfall and other climatic conditions. From reports received the summers are bright and warm, with sufficient rain. The ice leaves Swan Lake early in May and generally commences to freeze over about the middle of October. This year ice commenced to form around the shore of the lake on October 20th, and the lake was completely frozen over early in November. Summer frosts are likely to occur, but generally early in the season. This year there was a heavy frost over the greater part of the Peace River District early in July, but the grain apparently was not greatly injured, as good yields were harvested in most parts. In this connection the experience of one settler in the vicinity of Grande Prairie can be mentioned. He had 100 acres of wheat and after the frost decided to cut it for green feed. For some reason 5 acres were left and these later gave a yield of 30 bushels to the acre.

Moose, deer, and bear are numerous. Few were seen by members of the party, but numerous tracks were found in the new snow, particularly those of moose. Grouse and some prairie-chicken were noted, but reports say it was an exceedingly poor year for these. Rabbits are very scarce, but from indications have been very numerous and will probably be so again. Swan Lake is famed for the quantities of ducks and geese that rest there and thousands of them were seen. Whitefish and pike are plentiful in the waters of the lake.

I have, etc.,

ALAN J. CAMPBELL, B.C.L.S.

ROSE LAKE, COAST DISTRICT, RANGE 5.

BY H. C. BLACK.

December 14th, 1918.

J. E. Umbach, Esq.,
Surveyor-General, Victoria, B.C.

SIR,—I have completed the surveys mentioned in your instructions of October 30th in the vicinity of Rose Lake. The country in this district south of Rose Lake and west of Palling is timbered mainly with poplar and jack-pine, with some spruce. The timber is open and suitable for grazing, the undergrowth containing a good percentage of peavine. As the railroad has been fenced in this danger to stock has been removed. There are also some pieces of willow bottom scattered about which when cleared up should make good hay land.

There are some ten settlers here, some of whom have brought in a little stock, and others are expected in in the spring. They have already cut out two roads, one to Rose Lake and the other to Palling, but these need improving. They are in communication with the Dominion Government and hope soon to have a post-office established at Rose Lake. The present post-office and Government telegraph-station are at South Bulkley. A small store has also been started at Rose Lake, where the necessaries of life may be obtained.

I have, etc.,

H. C. BLACK, B.C.L.S.

MOOSE SPRINGS, CARIBOO DISTRICT.

By F. P. Burden.

October 10th, 1918.

J. E. Umbach, Esq.,
Surveyor-General, Victoria, B.C.

Sir,—I have the honour to submit a general report on the country surveyed by me during the present season. The portion surveyed lies about twenty-five miles from the City of Prince George in a southerly direction, and is traversed by the Fort George-Blackwater Road. The immediate vicinity in which most of my work was done is known as Moose Springs, a name derived from a large spring of excellent quality situated beside the road in the pre-emption of O. B. Hughes.

Generally speaking, this is a rolling country, having low-lying hills or ridges, usually running from north to south, with level benches or level depressions between. As before stated, the Fort George-Blackwater Road runs through this region and provides the only means of access thereto. For a road in a new country it is in reasonable shape and is being improved from year to year. Cars can now run over it, though it can hardly be called a motor-road. Branching off from this, about two miles south of Twenty-one Mile, is a settlers' road, built by pre-emptors to enable them to reach their locations. It extends south-easterly for about eight miles, but is barely passable in spots and is built with but little attention to grades. The nearest post-office and market is at Prince George, reached by the wagon-road above referred to.

During the summer considerable prospecting has been done in this vicinity, and a number of claims having good copper-showings have been located. No development-work has yet been done, but interest is being aroused in this part of the district, and it is only a question of time until systematic prospecting and development will prove or disprove the presence of minerals in paying quantities.

The soil on the ridges is usually a sandy loam or gravel. On the level benches or valleys it is a black loam or chocolate-coloured loam.

Very little farming has been done, but excellent results have been obtained in gardens, all manner of vegetables being produced, and of fine quality. Remarkably fine sugar-beets were growing in Duncan MacKenzie's garden, while the potatoes in O. B. Hughes's garden were unsurpassed by any I have seen this season. Small fruits also flourish, but fruit-trees have not yet been tried, although a few miles east, on the shores of West Lake, I believe apples have been grown.

This area, with the exception of a few wet meadow-like spots, is thickly wooded, with jack-pine and poplar predominating. In some places the jack-pine is large enough for tie-timber. Under the ordinary methods of first-hand clearing the cost would run from $40 up to $75, but doing this on a large scale with the proper equipment, this could be reduced 50 per cent.

During spring and summer there is sufficient rainfall to ensure a good growth, and there is a heavy snowfall in winter, lasting usually until May, and beginning to fall in November. Summer frosts are still a detriment, but I have no doubt the clearing and cultivation of fair-sized areas will do away with these to a great extent.

Game is fairly plentiful, moose and deer being the most important. Fair-sized catches of fur are still made every winter. This includes beaver, lynx, fisher, marten, and mink.

Altogether, this area compares very favourably with other portions of this district now being settled.

I have, etc.,
F. P. Burden, B.C.L.S.

VALLEYS OF BAKER, NARKOSLI, AND MAKIM CREEKS, CARIBOO DISTRICT.

By R. W. Haggen.

December 20th, 1918.

J. E. Umbach, Esq.,
Surveyor-General, Victoria, B.C.

Sir,—I beg to submit the following report on the surveys made by me during the past season:—

The territory covered was the Fraser River Valley between Soda Creek and Kersley and the valleys of Makim, Narkosli, and Baker Creeks, in addition to which two pre-emptions were surveyed at Goose Lake, on the Quesnel-Fort George Road. All the outlying lots in this section were tied in, with one exception, and twenty-six pre-emptions surveyed; while data was gathered as to topography throughout the section, so that the new issue of the Quesnel Sheet of the pre-emptors' maps may be the more complete.

The first work undertaken was the survey of pre-emptions in the valley of Baker Creek, between fifteen and thirty-two miles west of Quesnel. Three of these were taken up with the intention of farming rich bottom lands, while the others cover swampy areas which may, after drainage, be converted into hay meadows. On four of the places hay was cut this year, but I was disappointed in the quantity per acre; it is all sedge, but will doubtless fulfil the purpose of keeping stock alive during the winter. However, I should judge that it is necessary to cut at least 2 acres of hay per head of stock. The meadows as a rule do not lie along creeks, but around small lakes. When drained, it has been the experience in other parts of the country that such meadows cannot be depended upon. In wet seasons they will produce a good crop, while a dry spring, or light snowfall in winter, will result in a very slim crop. The past season was not favourable, and this doubtless accounts for the light crop. However, I think there is feed and range available for 300 head of cattle in the district near Puntchesakut and Puntataenkut Lakes.

There is considerable good range available for several miles up the valley of the Middle and South Forks of Baker Creek, in pot-holes and in poplar, where peavine grows well. On some of the fire-killed areas there is a good growth of summer feed; others are barren.

On the bottom lands the cost of clearing would probably be $40 to $60 per acre. On these timothy grows well, and probably clover would yield a good crop. On account of the altitude and frequency of summer frost only hardy vegetables can be grown. Potatoes are grown for the use of the settlers, but they are, naturally, not of a marketable quality. Root-crops, cabbage, and cauliflower, however, grow well.

Most of the settlers have been on their places for several years and seem well pleased with their progress, though none could make a living off their pre-emptions alone until considerably more improvement has been made; in fact, most of the places contain so small an area of land that could be made productive that they never would support a family. However, each settler has some stock that is increasing and produces some revenue; he has a comfortable home, can live economically, and by means of trapping in the winter and working out in spare times he is enabled to make a comfortable living, and is probably better off than many a man in the cities. They at least have their living, and their stock would represent savings, apart from the value of the improvement of their holdings, which has a certain selling value. No doubt in a year or two there will be a school in the settlement. There is no post-office yet, but the places lie along the mail route from Quesnel to Nasko, where there is a monthly mail service.

The settlers tell me that they rarely feed their stock before Christmas, and turn out in April. In the winter there is rarely 2 feet of snow. I presume that the low temperature in winter would probably be about 60 degrees below zero.

During the trapping season the settlers arrange among themselves for the feeding of their small bands of stock together. Each season the fur-catch contains a fair number of fox, chiefly cross, but some silver and black, which have a good selling value. The other fur is beaver, weasel, musk-rat, and an occasional fisher or lynx.

The locality seems to be poor for game. There are few deer and grouse. In the fall there are quantities of ducks and geese. I also saw a rather rare sight in the district, a flock of pelicans. In the marshes around the lakes there are some of the despised "sand-hill cranes," which are really excellent to eat, though not easy to shoot. In Baker Creek and Puntataenkut Lake there are trout of various sizes.

About twenty-five miles to the west of this settlement, in the lower end of the Nasko Valley, there are some good herds of cattle.

Vicinity of Goose Lake.

On completion of the work in this locality I moved to Goose Lake, on the Fort George Road, and twenty-five miles from Quesnel. Here two pre-emptions were surveyed, one containing a portion of the meadow around Goose Lake and the other containing some meadow land along West Creek, the holder being absent on military duties. The first of these pre-emptions contains only a few acres of very poor meadow, and the balance of the land is of poor quality, but would afford some pasture. The place on West Creek contains the best land in this locality, but is not large. By clearing willows 40 acres of hay land might be utilized. Lying along a creek, this meadow has not the drawback of meadows around the lakes. By damming the creek the ground can be flooded each year, then drained off so that it is dry in haying-time; thus a more reliable crop is secured. If worked to its capacity this place would probably carry thirty-five or forty head of stock. The climate, however, is rather more severe than that of the Baker Creek Valley, and undoubtedly there are severe summer frosts. Outside the hay meadow there is no agricultural land, the sides of the valley being rough and stony, with a dense growth of jack-pine.

There are plenty of beaver along this creek, and the fur-bearing animals are doubtless to be found in the vicinity. It is ten miles north of the Baker Creek Valley, but there is a high ridge between. There are ducks and geese on the lakes in the fall.

During the days of heavy travel on the Fort George and Fraser Lake Roads Goose Lake was a regular stopping-house, and it was at this time that settlers went to this locality, and also farther to the north along the road in the vicinity of Swan Lake. All these places are, however, deserted. There is usually an operator at the Blackwater Telegraph-office, on the Yukon Line, and one at Bobtail Lake, forty miles westerly; apart from these, the country is absolutely deserted after one passes Bouchie Lake, six miles from Quesnel. In the winter the Inland Express Company keeps a man at Goose Lake to look after horses. It is rather a change from the days, a few years ago, when I have been one of twenty paying 50 cents for the privilege of sleeping on the dirt floor in the old Goose Lake Cabin, and glad to get shelter; and memory also reverts to a night in a cabin at Blackwater when it was 35 degrees below. That cabin was not chinked, a folding stove was intended to provide warmth against a wind that blew the snow clear through the cabin, while we tried, unsuccessfully, to thaw bread broken into fragments with an axe. Now the cabins are comfortable but deserted; then they were incomplete and crowded.

In these days, with numbers of horses on the road, any kind of hay was valuable on account of the demand, which accounts for the meadows being taken up. Most of the places have been Crown-granted and abandoned, but as other portions of the district are settled up some settlers will probably again be found along the road with small bunches of stock.

Near Mouth of Narkosli Creek.

The next work done was on the west side of the Fraser River, between Higdon and Narkosli Creeks. Two of the parcels, the owners of which are overseas, are, I think, about the poorest pre-emptions I have ever seen, and I am at a loss to understand why they were ever recorded. One consists of a rocky hillside along the Quesnel-Alexandria Road, and the other of a swamp, that shows no sign of producing hay, on the summit of the plateau. Of the other parcels, one contains a little flat near the mouth of Narkosli Creek sufficient for a settler with other means of support to raise a garden and sufficient feed for his stable. He has raised excellent vegetables during the past season. The other parcels were on a bench above the road, ten miles from Quesnel; they contain some good land, which is now covered with a growth of birch and cottonwood, which could be cleared at a cost of $25 to $40 per acre. A good spring provides domestic water. As a general rule this bench would, I think, be immune from summer frost, and good crops of roots and grain should grow without irrigation. From the nature of the vegetation I should judge that clover would also grow well. A rough road from the Quesnel-Alexandria Road runs through this land.

This locality has good access to Quesnel. The main road to Narkosli Creek is suitable for motoring, and the creek is only fourteen miles from Quesnel. A steamer on the Fraser River

provides freight and passenger service during the summer months. Quesnel is the post-office for the locality. There is no school. The benches along the Fraser suffer from an occasional summer frost, but generally crops do well. Irrigation is necessary for hay-crop, but not for grain. Generally speaking, the soil is a sandy loam, but there are patches of sand and gravel. There are some clumps of fir timber, but the vegetation generally consists of jack-pine and aspen.

The benches along the river here vary in width up to one mile; then a steep hillside rises to the plateau above. This plateau in general consists of rolling land, wooded with jack-pine, and somewhat stony; the soil is hard-pan to near the surface. There are scattered hay meadows small in extent; through the jack-pine the grass is generally of a poor feeding quality, but in open patches there is good range.

Messrs. Baker, Higdon, Wright, and Roddie are running cattle in this locality, probably 220 head altogether, and there would be summer feed for a larger number. Mixed farming is the industry to which the lands along the Fraser River are best adapted.

Alexandria, East Side of Fraser River.

Three pre-emptions were next surveyed in the vicinity of the Cariboo Road, in the Alexandria District, between twenty and thirty-five miles south of Quesnel. Two of these were owned by soldiers. The first lot lies in a draw about a mile from S. Hilborn's ranch, at the 201-Mile post, Cariboo Road. In this draw there is some very nice land, where the soil is a deep loam, the arable land being some 30 acres in extent. The vegetation consists of a rather dense growth of cottonwood and willow, and would cost at least $50 per acre to clear. There would also be considerable probability of summer frost. Root-crops and oats should grow, however.

Lot 9527, the next lot surveyed, is, I should say, useless as a pre-emption, though the settler probably thinks otherwise. It is hilly, dry, and wooded with fir which is not of good quality. There might be 500,000 feet of merchantable timber available on the whole area. There is fairly good range on the side-hills. The land lies to the south of Cuisson Creek and about a mile and a half up the hillside from the 190-Mile post, Cariboo Road.

The other pre-emption surveyed in this locality contains a fraction along the Fraser River, immediately south of the Alexandria Indian Reserve. There is some good land in the flats, but it is dry, and without irrigation the crops raised are very poor. A portion is open and grassy; the balance is wooded with cottonwood, willow, and brush. Near the river a considerable portion has been hydraulicked, and is in consequence of no agricultural value. This lot is near the 185-Mile post, Cariboo Road.

From Cuisson Creek, at the 190-Mile post, to this place there is a wide bench along the river, and it has been settled for years. Portion of the bench is owned by the Indians, and some under old pre-emptions, the owners of which are dead. Without irrigation the crops raised are very poor, and with such an excellent water-supply as Cuisson Creek available one cannot understand why irrigation systems were not constructed years ago. It is probable that sufficient water is available for the whole bench, as there are excellent storage-basins in the creek-valley, and the creek always has a good volume. Thirty years ago Chinese miners built ditches and dams and utilized the water. The ditches extend the full length of the bench. It is probable that lack of ambition and co-operation account for the state of affairs that has been allowed to exist. One man told me he "always had a good half-crop." In the seasons I have seen these crops I should say that through lack of proper farming methods the land has become so run out that it does not raise one-fifth of what it should. One field has been in oats each year for a quarter of a century, and the crop this year did not yield more than 100 lb. of oats per acre, and these were mostly wild oats. Windt Bros., who recently purchased the old Cuisson Ranch at the mouth of the creek, are installing an irrigation system. The line of the Pacific Great Eastern Railway passes along this bench, and probably, when that line is complete, new owners will have the other ranches, and one may hope, in the future, that the "Alexandria Flats" will do their duty as they should.

Upper Narkosli Valley.

I next surveyed two pre-emptions in the Narkosli Valley, about eight miles west by road from the Alexandria Ferry, on the Fraser River. This creek runs through a fairly open, grassy valley, and along the creek there are some good flats on which timothy will grow well. In many places there is a dense growth of willow. There are a number of unsurveyed Indian allotments along the valley, and four white settlers have also located.

The valley is here at an altitude of some 2,500 feet. There is considerable summer frost, and the hay-crop is, I think, the only crop that would be reliable. The soil is a sandy loam, and the flats along the creek are free of rocks. There is some range along the valley, where the cattle from the ranches near Alexandria feed. The Narkosli is a large creek, with three branches which rise some twenty miles from Alexis Creek. I have measured the stream in October, when it is probably at its lowest, and it then had a flow of 60 cubic feet per second. A portion of the water is now diverted to irrigate the Sunnyside Ranch at Alexandria. I hope to see the day when it will also be used to irrigate the benches between its mouth and Higdon Creek, and when the present system to Sunnyside Ranch will be enlarged to include a goodly portion of the benches on the west side of the Fraser Valley at Alexandria.

On the South and Middle Forks (Twan and Webster Creeks) there are some excellent hay meadows, from 10 to 80 acres in extent, on which a good crop of "sugar-cane" hay it cut, two hundred and fifty head of cattle are now wintered on these meadows, in addition to horses.

I tied these lots to Lot 9494, Tingley Creek, which had previously been tied to surveys in the Fraser Valley. On this tie there are a couple of swamps that may possess possibilities as hay meadows. I am also informed that there are other meadows to be found in the district. This tie did not pass through any agricultural land.

The next tie was from the most southerly lot on Twan Creek to Lot 433, an old Crown-granted hay meadow which was not made use of for several years. Much discussion had arisen as to the creek on which this meadow lay, whether on Twan or a fork of Makim Creek. It is actually on a branch of Tingley Creek. Several people have staked it during the past few years, and various descriptions of its location were given. In these cases, with Gazette notices before me, I am reluctantly bound to conclude that the stakers were badly lost in the woods.

A road to this meadow leads by way of McRae's meadows to Riske Creek, some thirty-six miles distant. An old trail also leads to Twan's meadows, five miles, and another, which is almost undiscernible now, to Lot 102, Yorston's meadows, on Makim Creek.

This meadow, on Lot 433, is now owned by P. D. McRae, a stockman of Riske Creek. I have seen few meadows which equal it in yield per acre. While the meadow is scarcely more than 80 acres in extent, the crop is nearly 120 tons. It has a good bottom and is easy to flood and drain.

At this time I was compelled to suspend the field-work for a month and pass the time in the unpleasant precincts of an isolation hospital; the "flu" germ was very active in Cariboo.

Mouth of Hawks Creek.

Upon resuming work I surveyed a pre-emption at the mouth of Hawks Creek, three miles below Soda Creek, and, incidentally, made a tie between lots along the Fraser River. The pre-emption contains about 25 acres of bench, which would be productive if irrigated. In its present condition grain and vegetables can be raised. The timber is fir, small in size, and there is some open bench. The cost of clearing the timber would be $40 to $50 per acre. There is a good road to Soda Creek. Along the river, on either side of this lot, the land is very rough and wooded with scrubby fir.

Meldrum Creek, near Callanan Lake.

Some outlying lots on Shell and Meldrum Creeks were next tied to the surveys at Callanan Lake, which had been tied previously to the Chilcotin township surveys. On Shell Creek there is no land that is of any value, with the exception of small meadows which were taken up a number of years ago.

The valley of Upper Meldrum Creek is generally rolling and wooded with jack-pine and poplar. There are numerous lakes, the largest being Callanan, Meldrum, Natsy, and Dester. The only land that is at all suitable for farming is on the shores of Callanan Lake, and that is not of very good quality.

The meadows along Meldrum Creek are also disappointing, the hay being of a very poor quality. However, it brings the stock through the winter.

The road from Riske Creek, thirteen miles from Callanan Lake, to Makim Creek follows the valley for some distance, and trails lead to Meldrum Creek Settlement, on the Soda Creek-Chilcotin Road.

MAKIM CREEK.

The last work of the season consisted in tying in some lots to Lots 102 and 109, Makim Creek. Between Lots 109 and 9181 the country is swampy and of no value. Between Lots 102 and 242 there is a small meadow which has been staked as a lease; the balance is mostly rolling, stony, jack-pine country, with a few grassy pot-holes. Lot 242 appears to be a miserable meadow, and, so far as I know, it has never been utilized.

Along Makim Creek there are some excellent meadows, held by Messrs. Yorston, Cotton, Arthur Bros., and Moon. About 1,800 head of cattle from the Chilcotin District are wintered on the meadows of Makim and Meldrum Creeks; the Makim Creek hay is of good quality.

MAKIM CREEK TO ALEXANDRIA.

Lots 102 and 103, Makim Creek, were originally taken up by William Adams in connection with Sunnyside Ranch, Alexandria, and a road was built between the places. Until a few years ago this road was considerably travelled. This season, when returning to Quesnel, I came out over it, but it is badly covered with windfalls and will hardly be of use as even a trail now. In one place we spent three hours making one mile of headway, and only travelled twenty miles in ten hours.

The old Hudson Bay Trail from Narkosli Creek to Alexis Creek is also badly covered with fallen timber, and it is practically impossible to follow it now. As this trail provides an excellent short route from the Upper Chilcotin to Alexandria and the Fraser Valley, it is a pity that it is not kept open.

INDUSTRIES.

The chief industries of the Cariboo District at the present time are farming, stock-raising, and mining. The farming is chiefly confined to the Fraser River Valley. Excellent root-crops are grown and various grains. Wheat is milled at Soda Creek and local flour used throughout the greater part of the district. The vegetables will compare favourably with those raised in any part of the Province. Several of the farmers have good dairy cattle, and a fair proportion of the butter used is made in the district. Most settlers have a few hogs and there are small flocks of sheep.

The stock-raising industry is the mainstay of the Chilcotin, Alkali, Lac la Hache, and 150-Mile House localities. Individual ranchers have herds varying in number up to as high as 1,700 head. In the fall the cattle are driven to the Pacific Great Eastern and Canadian Pacific Railways, at 59-Mile and Ashcroft respectively. This is a flourishing industry at the present time owing to the high price of beef.

Mining is at present confined to placer-grounds in the Barkerville and Horsefly, while one claim is operated at Cottonwood Canyon, on the Fraser River, twenty miles above Quesnel. However, the output this year is disappointing. Low values of platinum have also been found. Whether there is "pay" in the district will be found out in the future. Scheelite containing tungstic acid occurs at Hardscrabble, near Stanley. In the range to the east of the Fraser River there are several outcrops of copper which may be of value when the railway is completed. At Birrell Creek, Quesnel River, gold and platinum are being obtained. There is a large coal-body at Australian Creek. In addition to the foregoing, there are good deposits of diatomaceous earth, carbonate of lime, and clay, which may form the basis of some future industry. Kaolin is reputed to have been found near Sheep Creek, but I have not seen the samples.

TRANSPORTATION.

The main artery of transportation in the district is still the old Cariboo Road, and it will continue so to be till the Pacific Great Eastern Railway is completed. From this road branches run to various parts of the district. On the Fraser River there is a steamer service between Soda Creek and Fort George, and freight is carried at very reasonable rates. There is, however, one bad drawback to a river-steamer service in the northern waters, so far as the farmer is concerned. About the middle of September, before his crop is ready to market, the water is so low that the service becomes erratic, and by the first of November the steamer is unable to operate at all; the steamboat service is from May 1st to October 31st. This involves the holding-over of practically all freight for the outside until the following summer. However, there does not usually seem to be much more produce raised in the district than the local market demands; though, with transportation and an outside market assured, there is no reason why much more produce could not be raised. This year there is reported to be a surplus of wheat.

Settlement.

Owing to conditions incident to war, cessation of railway-work, and enlistments, a number of settlers have left the district. In one locality there were over sixty settlers in 1914; to-day there are not over ten. Many of these obtained Crown grants before leaving for other fields. No doubt some will now return to these places, but many are permanently abandoned so far as the original locators are concerned. This condition occurs largely throughout the district. At present there is little demand for the land, and the settlements will doubtless fill up again when development is renewed in the district. Some localities are good settlement areas.

Game.

As the district is large, it contains many varieties of game and fur-bearing animals in the different localities. The big-game hunter can find much enjoyment in the Barkerville region, where the moose considers himself monarch; at least, one sees him frequently along the margins of the lakes and rivers, and he is the picture of open defiance, ready to fight when molested. The grizzly bear is also at home in this region, and some splendid specimens have been obtained. On the hills caribou are numerous, and to the north-east one enters the mountainous country where the goat has elected to live. Of fur-bearing animals, marten, beaver, and lynx are the principal. In the Quesnel Valley and along the Fraser and west of the Fraser there are some deer. Fair catches of fur are made all over the district. On the large creeks and in Quesnel River there is excellent fishing.

I have, etc.,
R. W. Haggen, B.C.L.S.

HORSEFLY RIVER AND QUESNEL LAKE, CARIBOO DISTRICT.

By F. Butterfield.

October 23rd, 1918.

J. E. Umbach, Esq.,
Surveyor-General, Victoria, B.C.

Sir,—I have the honour to submit the following report on territories covered during the past summer:—

These territories contiguous to Horsefly and Quesnel Rivers comprise one of the oldest portions of our Province. History affirms that Peter Dunlevy, whilst at the mouth of Chilcotin River searching for gold, was directed by an Indian to meet him at a certain time and place. The appointment was kept and Dunlevy was introduced to what ultimately became the famous Horsefly mines. This was in 1858. For years afterwards there was a rapid influx of people to the Cariboo; indeed, the 1859 rush was directly responsible for the foundation of New Westminster. From Horsefly the miners extended energetic operations northerly, and Quesnel River (remarkable rather for inactivity at present) in 1860 gave employment to "600 miners, who earned from $10 to $25 per man per day." Since the decay of mining there has developed apparently an agricultural effort, sometimes more and very often less successful. The amount of success depends upon the varying conditions the individual farmer is called upon to contend with, and I believe, to a greater extent than in most places, upon his wisdom and foresight.

Every year he has to prepare for a five-month winter siege, during which time he must feed his stock; and every summer he hopes, against all expectations, the frost will spare his crops. The inevitable summer frost is a source of torment to the agriculturist. Unfortunately, owing to the high altitude of the district in general, it is problematical if the farmer can ever be immune from its scourges, as is the case in some of the "muskeg" districts, where clearing and drainage have been so beneficial. Here, as in all ranching localities at the present time, much difficulty was experienced during the past summer in obtaining hired help for haying. At the time of my leaving this had developed a serious aspect owing to exceptionally heavy precipitations and the necessity, in consequence, of handling hay rapidly. I understand, however, that September proved as exceptionally fine as August had been wet, so it is not expected there has been an undue depreciation in the hay-crop.

On account of so much moving over long distances at a time it was impracticable to keep records of temperatures and rainfall, and likewise, unfortunately, only a very rough idea could be gleaned of the adaptabilities of soil and climate to crops. However, notes were made of all noticeable points of this nature likely to be of worth and interest. These are embodied in this report under their suitable headings.

CHARACTERISTICS.

Horsefly River flows into Quesnel Lake about sixteen miles from the lower extremity. In its course it drains probably 600 square miles of territory, flowing westerly and then northerly and discharging into Horsefly Bay. Quesnel River, or at least that portion of it with which I have to deal, drains Quesnel Lake, making its confluence with the North Fork at Quesnel Forks about seven miles and a half distant from the lake. The only tributary to these waters of any importance in this report is Moffat Creek, which flows northerly, uniting its waters with those of Horsefly River at the big bend. The creeks flowing into the included section of Quesnel Lake are insignificant; the largest is only a few links in width.

The most notable characteristics of the country are its narrow valleys and usually high hills. These are more marked on approaching Quesnel Lake and Quesnel Forks. Indeed, the old mining town of Quesnel Forks is literally hemmed in. There is much available grazing territory above Horsefly Bay, but little or no agricultural land of any description from there to Quesnel Forks.

Harpers Camp, the most populated settlement, is situated near the junction of Moffat Creek with Horsefly River. It marks to all intents and purposes the end of communication and the Horsefly Road. The other six or seven miles of the old Horsefly Road, which was built, as the name implies, for the benefit of Horsefly Mine, has seen very little travel for a number of years. The whole district is liberally supplied with roads, but, alas! most of them are in poor shape, as the travel does not now warrant their upkeep.

ACCESSIBILITY.

At the present time the most important of these after leaving the Cariboo Road is the Horsefly. I refer to the road between the 150-Mile House and Harpers Camp. The road running from the 108-Mile House to Harpers Camp bears the same name, though locally it goes under the name of the 108 Road to distinguish between the two. As I have only been over a portion of the latter I can only speak from hearsay, but I understand it is an impossible route for the greater part of the year. The 150 Road, however, is in very fair condition, excepting very wet periods, when it has a tendency to develop "chock-holes." A weekly mail stage (horses or auto, according to road condition) carries passengers between the 150-Mile House and Harpers, while occasionally one of the several automobile companies operating out of Ashcroft send in a car. Any small party will find this by far the cheapest form of transportation.

About fourteen miles of new road has recently been completed from Harpers Camp up the north side of Horsefly River to some distance above Wood Jam Ranch. This is quite good for motor traffic, but its continuation (the old road) is in miserable condition. Harpers Camp is the junction of several roads in addition to these—Beaver Valley Road, in good condition; the old Wood Jam Road, now practically out of use, rocky, steep, corduroy, and culverts decayed; and also there is the continuation of the old Horsefly Road, the usual route to Quesnel Lake. This latter is in surprisingly good condition considering the small amount of traffic which goes that way, and could be made perfectly good should circumstances ever warrant a small expenditure. From Horsefly Mine to Squaw Flats the road is of the roughest description for any kind of vehicle, but yet provides a means of transportation far superior to pack-train.

It is really a settler's road, having been built partially over one of the cordwood roads originally cut to convey wood to Horsefly Mine, and partly, I believe, cut through the timber by Mr. Hooker, a settler at the mouth of Horsefly River. A great amount of laborious grading for one individual to accomplish has been performed on the last half-mile. Here the road follows side-hills on a very fair grade down to the river-level at Squaw Flats. From Squaw Flats it is possible with some manipulation to travel by boat the remainder of the distance to Quesnel Lake, but the labour involved on returning, lining up and dragging over bars, rather mars the advantage of water over land transport. Mr. Hooker's road extends some two miles beyond Squaw Flats, but here had to be abandoned, the nature of the country involving very heavy grading. From here, however, he built a pack-trail terminating on the bank of Horsefly River about half a mile

from the bay of the same name. This latter portion of the river is quite smooth and presents no difficulties. Although wagons and pack-horses are readily obtainable at Harpers Camp, it is a distinct advantage to procure the services of some one who has a working knowledge of road and trail. There are some three or more boats on Quesnel Lake fitted with engines of varying types, as also several craft without motors, but communication with the owners is commonly a lengthy process. From Quesnel Dam (at the foot of Quesnel Lake) one road runs to Little Lake, while a second connects via Quesnel Forks with 150-Mile House. As this road is largely cut in the rock, much of it will stand the wear of ages. One rock-slide, which could be remedied in a few hours' work with the shovel, is the only obstruction between the dam and the forks. A network of highways are open from Quesnel Forks to the many points in the mining district. Inquiries made of an authority elicited the information that the Polley Lake Trail was impassable even for a saddle-horse.

	Miles.
Distance from 150-Mile House to Harpers Camp	38
Distance from 150-Mile House to Quesnel Lake	55
Distance from 150-Mile House to Wood Jam Ranch	50
Distance from 150-Mile House to Quesnel Dam (via Horsefly)	71
Distance from Quesnel Forks to Quesnel Dam	7½
Distance from Quesnel Forks to 150-Mile House	68

While accessibility at the present time is no great problem, the matter of handling freight would be a serious one were there a sudden need for large quantities. The Pacific Great Eastern, which is located within easy distance of the Horsefly, will be a great benefit in the future.

Timber.

There is no lumber industry in any part of the district, to my knowledge; none is imported, as, when needed, boards can be whipsawn from convenient local timber. Although no merchantable timber came under personal observation, I am informed there are several good tracts that could be profitably cut were export facilities improved. Tracts of timber are reported to exist on Quesnel Lake. The lower end of the lake, however, suffered from fires some years past, leaving little but the stubs of what has at one time been a good stand of fir. Ninety per cent. of the remaining cedar, it might be said, is hollow.

Mining.

A more comprehensive knowledge than I possess is necessary to do this subject justice. There are still men in the district of clear memory who can look back to the days of '63 and converse on minutest details. Most of these, in company with other younger men, are of opinion Cariboo has yet much gold in store. At the present time mining is very quiet. Assessment-work, which usually means minimum work, is carried on as a matter of course. A company operating at Harpers Camp, which only recently put its plant in working-order, is using an ingenious dredge calculated to handle most dirt in least time. Up to present date its energies have been expended on old tailings, but results, as yet, have not been disclosed. It is rumoured that the Bullion, a well-known mine on Quesnel River, will be working again when conditions are favourable. Gold appears to be the only mineral which receives any consideration, although it is well known the mountains contain much of the baser metals. Prospectors are scattered here and there searching the creeks and old beds for new finds, while a limited number of older men content themselves with washing on their old claims. It would be pure presumption, however, to say they earn a living thereby. Horsefly gold is of the flour variety, while that of Quesnel River is said to be of a coarser nature. Shortage of water is somewhat of a handicap to the gold-miner. Many of the creeks emanating from small lakes have to furnish miners with this essential. Only too often these fail and operations cease in consequence. While the small watercourses are so uncertain, the large waterways are of a precipitous character and could be utilized as extensive power sources.

Farming and Agriculture.

A dearth of vegetables in the Horsefly District, a condition which I am told prevails annually, this summer unmistakably pointed out the enormity of the summer-frost detriment. During June and July the only means of acquiring potatoes was that of having them brought in from 150-Mile House. On July 24th, when all truck-crops were promising very favourably,

the district was visited with 10 degrees of frost. Needless to say, this had temporarily a disastrous effect, more especially on potatoes. However, in the latter end of August, although their crops had been considerably retarded, farmers congratulated themselves on an improvement over recent years. Truth to tell, most agriculturists look upon the successful growth of truck-crops as the impossible, and therefore take no means to circumvent the ravages of frost. Usually they plant a small patch and leave its future for Providence to decide. I did see smudges in use on two occasions, but Jack Frost had already done his worst. As there is some local market for potatoes, etc., it would probably be worth some enterprising farmer's while to install an overhead irrigation system of sufficient height to permit ordinary agricultural operations. This might be used as a frost-preventive by employing a fine spray set in operation nightly, and would provide a readily available supply of water in case of an exceptionally dry season. I noted at various places much "common scab" amongst potatoes, in most cases traceable to seed, continuous cropping, or wood-ashes of bush fires. Old potatoes were hard to acquire and worth 5 cents per pound in July, and earliest new potatoes came in at the end of the month.

Crops are all late, due to late springs and insufficient heat in the soil for seed-germinating. This tardiness is unduly enhanced in some localities by wet soils with insufficient drainage. Drainage requirements are very marked in all lowlands, and the soils are usually sour in consequence. There appears to be a prevailing desire to create swamps rather than drain them, in order to have swamp-hay for cattle-feed; not that timothy will not grow—as a matter of fact, precisely the contrary is true. With a little care at the beginning one or two farmers have obtained luxuriant stands. Nevertheless, timothy is very scarce in a country well adapted for hay. If the past season was at all typical of a Horsefly summer, there should be no need for irrigation. The months of June and August were much too moist to suit survey-party tastes, while July, although drier, had quite an ample precipitation. Still some of the residents possessed of garden-patches complained of "drying out." Possibly this was true where the soil was of a coarse texture and friable nature, but the hillsides with their deep green appearance bore no supporting evidence. As stock-raising gives little trouble and good grazing can be found almost anywhere along the Horsefly or on neighbouring hills, it is the most remunerative and satisfactory form of agriculture practised. The stockman needs large enough holdings to guarantee sufficient range, an ample supply of water, and somewhat extensive hay meadows.

Having these assets, together with reasonable luck, he ought to be successful. The hay meadows are absolutely essential. As already stated, calculations have to be made for provision for five months' winter feeding. Vetches and some form of clover resembling alsike grow luxuriantly, the latter especially needing only the encouragement of a little clearing. Beef is seldom consumed locally, mutton and bear-meat being the common viands of the district. Beef was recently sold at 11 cents on the hoof, but I think 10 cents is the more general price paid. Beef, hides, and furs, I believe, are the only commercial articles exported to the outer world. Demand for these as well as local consumption products exceeds the supply. Altogether there must be several hundred sheep in the district, and it is very gratifying to note, while coyotes are plentiful, they do not interfere with their successful increase. As small tracts of land will not furnish a living, the entertainment of communistic-settlement ideas is out of question here. Some complaints are heard of "winter killing." As this is a direct consequence of excessive moisture, adequate drainage ought to be provided wherever it applies.

Soils.

In a district whose soils are of different origins, or at least whose soils have undergone many different changes, it would be impossible to classify them without exhaustive study. No attempt has therefore been made, but some little notice was taken of soils in vicinities where surveys were in progress. Generally speaking, there appears to be some shortage of bases as is indicated in the higher lands; where, though, there may be little organic matter or moisture, soil shows slight acidity. This may account to some extent for the beautiful wild fruit gathered each year by residents of Harpers Camp.

Fish and Game.

The district of Horsefly and Quesnel Lake can only be described as a paradise for hunter and trapper. The large numbers of fur shipped annually, the beautiful heads of moose, caribou, and deer to be seen in settlers' cabins, and the tales that are told, all testify to this. Several

families rely absolutely on trapping to earn their daily bread, while many are to a greater or less extent dependent on the same source of livelihood. Amongst animals trapped are bear, beaver, coyote, fisher, lynx, marten, mink, musk-rat, otter, and weasel. Big game, comprising black and grizzly bear, moose, caribou, and deer, is most plentiful in the region of Quesnel Lake. Coyotes are responsible for the destruction of many deer, if the observations of residents are a base for calculations. Five deer were seen at one time last winter, driven down by coyotes and slaughtered on the ice of Quesnel Lake. Game birds are decidedly scarce, and rabbits, once so plentiful, are now seldom seen. This is attributed locally to the exceptionally severe winter of three years ago.

The fish-supply is quite on a par with that of game. Practically all lakes and creeks are well stocked with trout of varying sizes up to 10 lb. Quesnel Lake far exceeds this, rainbow weighing up to 16 lb. and char even to 40 lb. The largest fish taken by us measured 35 inches in length.

Moffat Creek and along Old Wood Jam Road.

In the vicinity of Moffat Creek there are suitable lands available for settlement in small scattered areas. A large proportion of the lower lands, flooded by beaver and overgrown with a dense underbrush, carry a black muck soil, usually underlaid with sand of varying texture. The ground rises from the creek in benches, where a medium sandy soil of yellowish appearance with a fine whitish to yellowish-grey sandy clay subsoil is usual. Stony, even rocky lands are quite common, and above only applies to the better portions of a naturally broken territory. What has been said of Moffat Creek applies to lands to which the Old Wood Jam Road is tributary, only the proportion of rock to soil is greater in the latter. Soils formed by weathering of rocks on the innumerable small hills have through centuries been washed and deposited in the hollows. In addition, often small lakes and ponds have been created in these places, around the shores of which are found soils limited in extent, but rich in humus.

Wood Jam Ranch and Vicinity.

Range lands comprise the prevailing feature in the vicinity of Wood Jam. The ranch itself, which is spoken of almost as a mile-post, consists of about 600 acres, mostly range. At some comparatively recent date, a fire, said to have been caused by lightning, swept the hills west of here and south of the river, leaving little in its wake for the settler to remove. Mr. McKenzie (Wood Jam) has experimented two years with alfalfa, but has only had partial success, although his experiments lead to the belief that, once established, alfalfa will be profitably grown. Hundreds of acres along the Horsefly River are flooded annually, a major cause for delayed spring operations. There has been some desire on the part of local farmers to have investigation made with a view to ascertaining the feasibility of shooting out the so-called "canyon" which is said to be responsible for this backing-up and resulting inundation. It has been said, if this were scientifically and economically performed, Horsefly River ought to pay its way by surrendering sufficient gold from the canyon to deplete expenditure. To say the least, this is very questionable. Such soil as there was a possibility of examining in the very little time at disposal, without interference with customary survey operations, proved to be a silty clay loam with little or no variation to a depth of 28 inches. It displayed slight acidity, no carbonate action, a considerable colloidal content, and in places a decided inclination to bake, though not so cohesive but what it would respond to ordinary cultivation practice. That specie of clover of which mention has already been made is very abundant in places.

The residents of aforementioned districts, in addition to some who reside on the shores of Quesnel Lake, receive their mail at Harpers Camp, where also the majority purchase supplies. Harpers Camp has recently acquired a second store, the proprietor of which, A. Campbell, is expecting a fair business and has made provision accordingly. Freight charge from Ashcroft to Harpers, at the lowest possible rate, is 4 cents per pound. The round freight journey takes approximately one month, and, as there is now only one freighter on this road, it is a slow and tedious freight route. Supplies can be obtained in much less time by Inland Express to 150-Mile House and by stage from that point. This, however, is much more expensive and inadvisable unless in cases of absolute necessity. Mutton is worth 22 cents per pound at Harpers Camp, and whilst beef is not for sale locally, it can be obtained at 150-Mile House, for 16 cents.

QUESNEL LAKE.

Quesnel Lake is remarkable for scenic beauty and notable for historical relationships. Its expansive waters are well stocked with trout and char and its neighbouring hills teem with animal life. Although agricultural land along its shores between Horsefly Bay and Quesnel Dam is practically *nil*, in a few places settlers have established their homes.

These, most of whom make a living through trapping in their endeavour to become to a large extent self-supporting, have grown fruit, beautiful and in quantities far in excess of their needs, while their gardens this summer were a pleasure to gaze upon. Here frost had had no sway, the huge expanse of water no doubt controlling the temperature. The soil is usually of a brownish-yellow appearance, a sandy loam with clay predominating occasionally. All gradations in texture can be found from coarse gravel to silt. Much of the soil at first glance appears to be wholly gravel, but on closer examination much finer material is determined. Although the subsoil is finer, there is still a tendency for the soil to dry out; much therefore depends on rainfall. There are probably 1,000 acres near the mouth of Horsefly River of very good land that should be eminently suited to fruit-growing. This amount might be doubled at some future date should Quesnel Dam ever be removed. Quesnel Dam (at the foot of Quesnel Lake) was originally constructed to retain the waters of Quesnel Lake for brief periods while the gold was being removed from the bed of Quesnel River. From all reports the scheme was an absolute failure, and the dam, which assuredly was a great undertaking for a mining company, remains, serving no purpose, but holding the lake at from 10 to 12 feet above its natural level. The dam itself will resist all nature's attempts at reduction for many years to come, but the gates are already giving, and their entire failure, unless given attention, may be expected any time. In such an event it is difficult to predict the ensuing consequences. It seems highly probable the current will cut away the bank on the north side of the gates (indeed, this is already taking place) and form a new channel. As the bank at this point and for some distance below is high and steep, the wagon-road which traverses the side-hill would naturally be damaged. If the lake should become rapidly lowered it is quite probable the freeing of such a huge volume of pent-up water would do damage at points lower down the river. Evidence of the former lake-level is visible everywhere. Standing dead timber out in the lake (at Horsefly Bay to distance of half a mile), almost total absence of beach where formerly it is said an auto might have been driven, and also Mitchell's Landing on the north side of the lake, where pack-trains were disembarked in early days after being ferried across from Mitchell's Bay, all furnish ample proof. This landing is now observed from a boat submerged in 8 feet of water and some distance offshore. As the dam only adds 12 feet extra head to the river, which itself is a straight run of white water, there seems to be little possibility of the dam ever becoming essential for power purposes.

At various times during the summer, more especially while journeying between Squaw Flats and Quesnel Lake, holes of 20 feet or so in diameter and several feet deep were remarked, as also others of more diminutive dimensions. The larger ones no doubt are of ancient Indian origin, the kind usually known as "kikalie holes," while it is assumed the smaller ones rendered service in the performance of culinary operations. There are now no Indians nearer than the Cariboo Road.

I have, etc.,
F. BUTTERFIELD, B.C.L.S.

NORTH-WESTERN LILLOOET DISTRICT.

BY FRANK TUPPER.

November 23rd, 1918.

J. E. Umbach, Esq.,
Surveyor-General, Victoria, B.C.

SIR,—I have the honour to submit the following report on the work done by me in the Lillooet-Cariboo District during the past season:—

The land surveyed is scattered over a large extent of country and necessitated a considerable amount of travel by wagon and pack-train. Commencing near the west end of Williams Lake and extending southerly along the Fraser River Valley, I surveyed eleven pre-emptions and four

Government lots. Six of these lots lie north of the 52nd parallel in the Cariboo District, and the balance to the south of the said parallel in the Lillooet District. Having completed the survey of all the unsurveyed pre-emptions in this locality, I then moved camp to Brittany Creek, in the Chilko Lake country, Lillooet District, where I surveyed three pre-emptions and two Government lots. From here I moved to the vicinity of the Big Creek Post-office, also in the Lillooet District, where I completed the survey of nine pre-emptions. The total acreage surveyed during the season was 4,944 acres. Owing to the scattered nature of the work a large amount of tie traverse was necessary, and no less than 42.5 miles of such were run.

Agricultural Possibilities.

With regard to the land surveyed along the Fraser River Valley, and which consists for the most part of stony hillsides with bunch-grass and elevated benches, I found the soil on the benches to be of good quality, but irrigation is necessary to make a success of farming operations. With water this soil is capable of growing almost anything, as the elevation is comparatively low and summer frosts are not frequent. At Four-mile Creek, on the ranch of Dr. C. Boyd, very fine crops of oats, barley, alfalfa, and vegetables of all kinds, including tomatoes, are being successfully raised under a small system of irrigation.

Brittany Creek.

This country is fairly level and thickly timbered with small jack-pine, and is interspersed with patches of swamp and meadow land of more or less limited extent, from which considerable quantities of wild hay can be cut. Outside of these meadows, however, and extending eastwards, the country is of the poorest possible description. A great deal of it has been swept by a fire in recent years, and in places this burnt country extends for miles where nothing remains but dead jack-pine and bare rock, what little soil there was having been burnt off. The elevation is high, somewhere in the neighbourhood of 4,000 feet, and we experienced severe frost almost every night we were in this inhospitable country. Farming here is an absolute impossibility.

As regards stock-raising, although I saw very little country that could be classed as summer range, I was told by one of the settlers, F. Angers, that there was good range country on the north side of the Chilko River. There is also a strip of fair range country running along the south side of the Chilko River from the mouth of Brittany Creek to Chilko Lake. Mr. Angers plans to put up winter feed at his meadow on Lot 4866 and to run his cattle over the above-mentioned range country during the summer months.

Big Creek.

There are quite a number of settlers on Big Creek, in the vicinity of the Big Creek Post-office, where stock-raising is the principal occupation of the settlers, but fair crops of oats and roots are successfully raised. Potatoes are not a regular crop on account of the uncertainty of the season, summer frosts being somewhat frequent. H. E. Church, who owns the ranch at the Big Creek Post-office, goes in for dairying on a somewhat extensive scale, and was turning out about 500 lb. of butter per month at the time of my visit. This butter commands a ready sale at Hanceville, Alexis Creek, etc.

The pre-emptions surveyed in this locality are distant some miles south and south-west of the Big Creek Post-office, where the elevation is somewhat higher. They consist for the most part of isolated patches of meadow land situated usually several miles apart, there being no two claims adjoining. They are all connected, however, by a wagon-road which is rather rough and rocky throughout. The country surrounding these pre-emptions is poor, being of a rolling nature with light soil, very rocky, and timbered with jack-pine. There are occasional open patches of grass land which make fair summer range. It may be classed as fair stock country, but farming is not likely to prove a success and is not likely to be attempted to any extent.

Transportation.

The pre-emptions along the Fraser Valley are blessed with a first class road running to 150-Mile House, on the Cariboo Road. This road touches the Pacific Great Eastern Railroad (now under construction) at the west end of Williams Lake, where it is said there is to be a divisional point. Settlers in this locality will, when the line is completed, have easy transportation for their products to the markets on the Coast and elsewhere.

From Big Creek Post-office there is a fair wagon-road to Hanceville, a distance of about twenty-two miles, which is on the main stage road from the Chilcotin country to Ashcroft, etc.

As regards Brittany Creek, the only means of access to this country at the present time is by pack-trail from Newton's ranch, which is situated on the main Chilcotin Road, about twelve miles west of Alexis Creek Post-office. This trail follows up the Chilko River on the left bank to the outlet from Chilko Lake, where there is a canoe crossing. Here it is necessary to take all freight across in canoes and to swim the horses, as the water is of considerable depth and the current very swift. This point is about fifty miles from Newton's ranch.

From here there is a pack-trail known as the "Old Nemiah Valley Trail" which runs in an easterly direction and crosses Brittany Creek in about eight miles.

CLIMATE.

In the Fraser Valley, which is considerably lower than the surrounding country, the summer climate is very favourable for the growing of crops. The winter is cold; occasionally the temperature goes as low as 40 degrees below zero. The annual rainfall is said to be about 15 inches, and 2 feet is about the average snowfall. I was not able to obtain much information about the winter climate at Brittany Creek, but on account of the high altitude the winters, I think, would be very severe. During the summer, at the time of my visit, the days were perfect, but, as I before stated, we had severe frost almost every night. The annual rainfall is said to be about 16 inches. At Big Creek the summer days were perfect weather, with occasional frosty nights. The winters are said to be very cold, with about 2 feet average snowfall.

GAME.

In all the different localities in which I was working this year game was exceedingly scarce. A few ducks and an occasional grouse were about all that were to be seen. In some places deer, I was told, were very plentiful in the fall. Fish, however, were plentiful in all the streams, rainbow trout being the most common variety.

CONCLUSION.

In conclusion, I would say that with irrigation the bench land surveyed in the Fraser Valley is very suitable for farming, and that the settlers here will shortly have transportation and a ready market for all they can grow. As to Brittany Creek, farming is an impossibility, but stock-raising may prove profitable for one or two ranchers, as the amount of summer range appears to be very limited.

Big Creek country may be classed as a fair stock country, but farming is not likely to prove a success and is not likely to be attempted to any extent.

I have, etc.,

F. TUPPER, B.C.L.S.

LILLOOET DISTRICT.

BY W. S. DREWRY.

December 17th, 1918.

J. E. Umbach, Esq.,
Surveyor-General, Victoria, B.C.

SIR,—I have the honour to report that in accordance with your instructions I proceeded to Lillooet District and surveyed a number of pre-emptions.

BEAVER DAM AREA.

Work was first undertaken in what is known as the Beaver Dam section, embracing the basins of 57 and 59 Creeks, west of the Cariboo Road. Much of this area had been previously surveyed, a considerable acreage being apparently held by grant from the Crown. It is an exceptionally fine section of country for cattle; and sheep would probably do well, since there is much open pasture in addition to a considerable number of meadows. The pine and poplar forest is quite open and the surface generally fairly level. At present the range is used almost exclusively for cattle.

Good trout-fishing may be had in both 57 and 59 Creeks; the fish in the former being more numerous, but those in the latter averaging larger in size, some of them reaching a pound in weight. Very little sign of game was observed in the woods, the absence of grouse of all varieties being noticeable, although a few years ago they were quite plentiful throughout the tract.

Deposits of carbonate of magnesia were observed in various localities, but considerable of it appeared to contain so much impurity as to make its value doubtful. In the vicinity of Meadow Lake these deposits are said to be of good grade and marketable.

The Bonaparte Country.

The next section of country visited was east of 70-Mile House, along what is known as the Currie Road, leading to the forks of Bonaparte River. This also is a range country suitable in parts to dairying and grazing, containing numerous meadows and lakes.

The waters of some of the lakes hold upwards of 2 per cent. of soda in solution, and are consequently not suited to human use, although freely partaken of by cattle or horses. It is possible that by pumping and the use of evaporating-pans a considerable quantity of carbonate of soda might be recovered in an inexpensive manner, which would pay settlers who would not be required to devote their whole time to its recovery.

Lying south of Currie Road, toward Bonaparte River, is a considerable tract of country unmapped and only partially explored. A hurried trip seemed to indicate that some good open poplar land lies along the slopes of Bonaparte River. This area could be easily opened by a short road from the bend of the Cariboo Road, north of Chasm Creek, toward the mouth of Fly Creek and the settlement about the forks of Bonaparte River.

The whole Bonaparte country seems to be primarily a grazing and dairying country capable of producing good fodder-crops.

Bridge Creek and Canim Lake Country.

Under your telegraphed instructions a long move was made to Canim Lake, where a dispute had arisen between the Canim Lake Indians and an applicant for land. After retracing a portion of the Indian Reserve boundary, this matter was satisfactorily adjusted by the survey of 160 acres along the north boundary of the reserve, adjoining its north-east corner. The balance of the land in this immediate vicinity was considered unsuitable for settlement, so no further surveys were made.

In travelling through Bridge Creek Valley from 100-Mile House it was noted that while in 1913 there was but one settler between the Cariboo Road and Canim Lake, now a number of families have established themselves, and fields of grain are replacing the poplar and pine. Other later settlers were building comfortable-looking houses and roomy barns; so that with a post-office and school in operation it seems as if permanent settlement had been accomplished. Several good gardens were noted, although in some localities complaint was made that frost had injured potatoes. As is frequently the case, it appeared to have been low-lying places that suffered, while the higher land escaped.

Silver Lake Valley.

Silver Lake Valley, some four miles north-west of the Canim Lake Indian Reserve and three miles from the Canim Lake Road, was then visited and three pre-emptions surveyed. There is a chain of three small lakes, the most westerly of which is Silver Lake, a beautiful sheet of water about three-quarters of a mile long by about one-quarter wide. These lakes are connected by a small creek, the water eventually discharging from Silver Lake through 111-Mile Creek into Lac la Hache. Rainbow trout are plentiful in the upper and lower lakes, and grayling are numerous in the shallow water along the shores.

Bradley Creek Valley.

From the most northerly of the pre-emptions in Silver Lake Valley a meridian tie-line was run northerly over the mountain three miles and a half to Bradley Creek, where two disconnected pre-emptions were surveyed and tied in. This creek is a considerable tributary of Eagle Creek, flowing into Canim Lake from the north, about seven miles from its westerly end. In places the valley attains a width of nearly half a mile and contains a limited amount of very good bottom land and meadows. At present this locality is rather inaccessible, being reached by a rough Indian hunting-trail some six miles long over the mountain from Silver Lake valley. One settler had a very fair stand of several acres of timothy, but no other attempt at agriculture appeared to have been made.

The valley rises on a very gentle grade from Canim Lake to 2,550 feet above sea, and frost ravages were less apparent in late September than on the slightly higher lands along Canim Lake Road.

RUTH LAKE VICINITY.

Having completed our work in the upper section of Bradley Creek Valley, we returned over the mountain to Ruth Lake, an unmapped sheet of water about two miles and a half from Canim Lake Road, north of Lot 2941, and surveyed a parcel of 160 acres containing Becker Lake, which it is proposed to drain. This scheme appears to be feasible, as there is considerable fall to Ruth Lake, which in turn drains into Bradley Creek.

Ruth Lake, about two miles long by three-quarters wide, is an extremely beautiful sheet of water and contains rainbow trout, which were frequently observed leaping from the water in considerable numbers. The lands east and west of the lake are high fir-clad ridges, but there is said to be very good land at its northerly extremity. Along the southerly end are small stretches of poplar-flats lying from 50 to 100 feet above the lake.

On the west side of Becker Lake there is a fine poplar-flat; but to the east the country rises in high granite ridges clad with fir. It was noted that the granite was of unusually fine texture, and if transportation were available would no doubt be of value.

A road has been constructed from Canim Lake Road to Ruth Lake, with the intention of continuing to Bradley and Eagle Creeks, which, when completed, will open up some good country now quite difficult of access.

While in the vicinity of Canim Lake a trip was made to Jim Creek, flowing from the south into Canim Lake, where B. McNeil has a farm of 165 acres cleared and mostly broken. A very fine garden of some 3 or 4 acres was particularly examined as showing what the locality is capable of. At Canim Lake Reserve it was noted that frost had cut down potato-vines; but at Jim Creek there was no indication of frost, most of the garden vegetables common to the latitude being well grown, including tomatoes just beginning to ripen.

Young apple-trees appeared to be thriving, having made good growth during the season. Some varieties of flowers and roses had also been grown. These exceptional conditions at an elevation of 2,550 feet above sea-level possibly arise from the fact that Canim Lake is about three miles wide at this point, and the large body of water may exercise such a tempering effect that frosts experienced in surrounding country away from the water are not felt.

The trip and examination were undertaken because there is a tract of some 2,000 acres near Mr. McNeil's farm, which, although timbered, might well repay the labour of clearing and prove the foundation of a prosperous small settlement.

93-MILE CREEK.

Having completed work in the Canim Lake section, we returned to 93-Mile Creek, on the Cariboo Road, camping at the crossing immediately adjoining, where we surveyed a very excellent pre-emption containing over 100 acres of meadow. The southerly portion is dry, while the northerly portion was wet in spite of a considerable fall to the south. This apparent paradox is perhaps explained by the fact that during part of the year the creek shows running water at the road crossing, but sinks within 100 yards, reappearing probably in the shallow lake on the easterly boundary of the land surveyed, whence it runs as a creek in a well-defined channel for a few hundred yards, and again sinks for a considerable distance. The northerly portion of the meadow is divided from the southern part by a dam partially natural and, it was thought, partly ancient beaver-dam which holds the water back. A channel cut through this dam and a few drains leading to it would render the whole of the meadow good hay land, and make this one pre-emption capable of carrying upwards of 100 head of stock, using surrounding country as summer range.

There are other 160-acre lots unsurveyed along this valley almost equally as good as that above described. The altitude approaches 4,000 feet above sea-level so not a great deal can be expected in an agricultural way; but timothy and clover will grow luxuriantly, as is amply proved by what has taken place about the old road camp at that point. This fact is important as there is a considerable acreage of good land east of the Cariboo Road in this vicinity.

I have, etc.,

W. S. DREWRY, B.C.L.S.

VICINITY OF PACIFIC GREAT EASTERN RAILWAY, BETWEEN PEMBERTON AND LILLOOET, LILLOOET DISTRICT.

By George S. Boulton.

October 29th, 1918.

J. E. Umbach, Esq.,
Surveyor-General, Victoria, B.C.

Sir,—I have the honour to submit the following report on surveys of pre-emptions lying between Pemberton and Lillooet, and also in the Fraser River Valley between Lillooet and Texas Creek:—

The first work undertaken was the survey of six pre-emptions on the west side of the Fraser River between Lillooet and Texas Creek. A. F. Hautier, since taking up his pre-emption on the south side of Texas Creek, has made considerable improvements; he has about 40 acres of level bench land, and this, together with the adjoining lot on the east which he has purchased, should make a very fine ranch. None of the other pre-emptions contain agricultural land to any great extent.

There is a good road from Lillooet to Texas Creek running through several ranches on which large crops are grown.

Two pre-emptions were surveyed on Seton Lake, one at the east and the other at the west end of the lake. The country along both sides of Seton Lake is very rugged and broken, and what land there is of any agricultural value has already been alienated from the Crown.

At the portage between Seton and Anderson Lakes are several small ranches which are being developed; the ranchers here are devoting their attention chiefly to fruit. Several pre-emptions were surveyed along the west side of Anderson Lake, taking up the balance of land of any value. The country to the east of the lake for almost its entire length is of a very mountainous nature, rising steeply from the shore. From the south end of Anderson Lake along the valley of the Gates River are a number of small ranches, the owners in the majority of cases being on active service.

Leaving the wagon-road about a mile from D'Arcy Station, near the north boundary of Lot 3127, a good pack-trail runs to Blackwater Lake, a distance of five miles and a half, and on to Birkenhead Lake, another four miles and a half. Traverse connections were made along this trail, linking up the various groups of surveys in this vicinity.

The Pacific Great Eastern Railway are now operating three trains a week each way during the summer from Squamish to Clinton, and two trains a week in the winter.

There is a good stand of timber—fir, spruce, cedar, and pine—in the country adjacent to D'Arcy which will create quite an industry when logging operations are commenced.

Considerable activity in mining is being displayed, and this district is being thoroughly prospected, development-work on the properties on McGillivray Creek being carried out.

As summer resorts Anderson and Seton Lakes merit attention from the public; trout-fishing on the lakes and in the creeks is excellent. Good accommodation is to be had at D'Arcy and also at the east end of Seton Lake.

I have, etc.,
George S. Boulton, B.C.L.S.

UPPER NORTH THOMPSON VALLEY, KAMLOOPS DISTRICT.

By W. G. McElhanney.

October 18th, 1918.

J. E. Umbach, Esq.,
Surveyor-General, Victoria, B.C.

Sir,—I have the honour to submit the following report of this season's surveys on the North Thompson River, north from Clearwater River:—

The valley of the North Thompson River is narrow, averaging about a mile in width. During the construction of the Canadian Northern Pacific Railway most of this land was alienated either by pre-emption or purchase. Many of these pre-emptions were occupied and improved, houses and barns built, and some clearing done. There were ties and bridge-timber

required for the railroad, and these were largely obtained from the pre-emptions, so that the work of the settlers was profitable. But with the close of construction this market fell off, and the settlers found difficulty in getting enough land cleared and in cultivation to make a living. A great many held on till they had completed their pre-emption duties and obtained their Crown grant, by which time their finances and their courage were at a low ebb, and the war and increased industrial activity elsewhere opened an avenue for many of them to leave. I would roughly say that two-thirds of the pre-emptions are now vacant, with cleared land going back to its original state and houses and buildings going to decay. Some of this land is good, especially that in close proximity to the river; but clearing is costly, and with the exception of cedar poles, railroad-ties, and in some cases shingle-bolts, there is no market for the timber on the pre-emptions. Mills or industries are required where men can find employment during part of the year, at least while living on and improving their holdings. There are individual cases of enterprising men who have held on, cleared land, and acquired enough stock to be able to live fairly comfortably. Garden produce does very well and expenses are not heavy.

The pre-emptions which I surveyed this year are mostly at the outskirts of the valley land, a small corner being flat or valley land and the remainder on the hillside. The hillsides are, as a rule, very thickly covered with a dense growth of small hemlock, spruce, cedar, birch, and poplar which has sprung up since the great fires that swept the hillsides bare. This land in its present state is of little value. It is impossible to clear these hillsides economically except by wholesale burning of large areas, and it would then be most suitable for grazing if seeded at once. The small area that can be cultivated is, in nearly all cases, all that the pre-emptor uses, and the remainder is only of value to him for any timber that he may be able to use from it or to obtain control of certain water privileges.

In the vicinity of Messiter, near Hell's Gate Canyon, the four pre-emptions I surveyed this year were mostly on a stony hillside separating the North Thompson River and the north branch of Salmon Creek. This hillside is covered with a light growth of poplar, easily cleared, but having very little land of agricultural value. The portions in the valley of Salmon Creek are better land, but this is heavily timbered with cedar and hemlock, is very wet, and the cost of clearing and drainage would be heavy. Only small portions of each pre-emption could be cultivated, and the remainder would be most suitable for grazing land.

At Avola there is one of the best mill-sites on the river at the mouth of a slough. The current is sluggish here and logs and shingle-bolts can be easily held. A shingle-mill has been in operation here for the past two years, but is now closed. There is some good land on both sides of the river, both above and below Avola, but it is subject to overflow. I surveyed three pre-emptions in this vicinity, each having a few acres of good level land and the remainder steep hillside covered with a thick growth of small timber.

Around Wire Cache two pre-emptions were surveyed. These belonged to soldiers on active service and were for the most part bench land or hillside timbered with tie-timber, the land being gravelly.

Vavenby is one of the oldest settlements on this portion of the river. Land has been occupied and cultivated here for over twenty years. The most of the valley land has been taken up previously, and the land surveyed this year, consisting of six pre-emptions, is almost entirely on the hillside and is most suitable for grazing purposes. There is a great deal of thick brush interspersed with scattered fir suitable for tie-timber. The timber is more scattered here than farther north, and grazing is better. The most of the pre-emptions were being acquired by adjoining owners who required additional land for cattle or sheep. The sheep industry is being carried on here quite extensively by one man who has a flock of about 500. These range on the top of the mountain in the summer in care of a shepherd, and are fed in the valley in the winter with hay grown on the valley lands. This country is mineralized and extensive prospecting is being carried on this year. A mine has been opened up within a mile of the railroad and shipments are likely to be made soon.

At Birch Island I surveyed only one pre-emption on a bench about 600 feet above the railroad. This land has been burned over and has grown up with poplar and willow. The land is rolling, somewhat stony, but appears productive, and is freer of frost than the low-lying land adjoining the river. There is considerable mining development here. A wagon-road has been built from the railroad for seven miles up the mountain, where development-work is proceeding

on a large deposit of low-grade copper. Should the results be satisfactory it will aid materially in the development of this district.

The remainder of our work was in the vicinity of the Clearwater River, where we surveyed four pre-emptions. The soil here is light and inclined to be stony. It is not very suitable for agricutural purposes, but more for grazing.

The climate in this portion of the North Thompson Valley is wetter than around Kamloops, but still not so wet that irrigation can be dispensed with. Occasional frosts occur during the summer, but these are less harmful on the bench lands than along the river. The snowfall is from 18 to 24 inches on an average. Summer months are usually fine, with plenty of sunshine and rapid growth.

Vegetables and small fruits can be grown almost anywhere in the valley. Apples are produced as far north as Vavenby. Less hardy fruits do not thrive well on account of the frosts. Hay is a staple crop, and where sufficient irrigation can be obtained gives good results, two crops at least being obtained. Summer feed is scarce, as the hillsides are too thickly covered with brush.

Game is scarce in the valley, but on the mountains adjoining there are bear, caribou, deer, etc.

At present this district is very backward on account of so many settlers being away at the war or engaged in some allied occupation, but with conditions normal again there is room for a limited number to engage in general farming, stock-raising, mining, and lumbering.

I have, etc.,
W. G. McElhanney, B.C.L.S.

LOWER NORTH THOMPSON VALLEY, KAMLOOPS DISTRICT.

By J. E. Ross.

November 22nd, 1918.

J. E. Umbach, Esq.,
Surveyor-General, Victoria, B.C.

Sir,—I have the honour to submit the following report in connection with my survey of pre-emptions on the North Thompson River:—

The work was a continuation of last season's. The country in general is somewhat similar, but there is less open grazing land and the hills are more rugged and heavily timbered or covered with a thick growth of brush.

I found the pre-emptions to be surveyed were even less favourable for farming than those of last year. Some of the pre-emptions had not been occupied or improved; some had been occupied intermittently and very little improved; some rather isolated, and others so inaccessible that it was impracticable to reach them with a good wagon-road. Only a few were suitable for farming.

Your instructions were to the effect that only pre-emptions actually occupied or held by pre-emptors in military service were to be surveyed, and that lands not particularly suitable for settlement were not to be surveyed. In carrying out the instructions I found it necessary to survey only about one-third of the number allotted to me. On the remaining ones I reported the particulars as fully as I knew.

The soil on the hills and benches is sandy and gravelly. Except the land has a considerable depth of black soil or sufficient water for irrigation, it is not worth taking up. It seems a pity that so much time and work have been expended on the uplands while there are thousands of acres lying idle along the river-banks. One reason that these bottom lands have not been settled on is that they were held at a high figure some few years ago, though such does not appear to be the case at the present time. The cost of clearing, which would reach $100 per acre in some parts, is another obstacle.

Lumbering was very brisk in this section. Several sawmills and logging camps were in operation. Besides lumber and railway-ties, a considerable quantity of electric poles, piling, and fence-posts are shipped from here. At the present rate of cutting, the timber in this part will be exhausted in a few years. The marketable timber comprises fir, pine, cedar, and spruce.

Quite a revival in mining has taken place lately on the North Thompson. More substantial development-work has been done during the past year than ever before. At the Queen Bess

Mine, near Blackpool, quite a force of men was engaged all summer. They had just completed a 400-foot tunnel leading to the main body of ore while I was in the neighbourhood. The manager was greatly pleased with the result. At Birch Island a wagon-road seven miles long had just been finished to the Lydia Mines. Since then machinery has been hauled up and a plant installed. A vaulable discovery near Vavenby has been quite recently reported. The coal-mines near Chu Chua, from which coal was shipped some twenty years ago, are to be tested by diamond-drill as soon as they are out of litigation.

Game appears to be gradually getting scarce. We only noticed several deer and a few grouse.

The Canadian Northern Railway, with stations every six or seven miles, has proved a great convenience to the settlers, but the mail service is poor, and while the mail clerks' strike was on it was very bad.

My survey operations were carried on under considerable difficulty, chiefly on account of the scarcity of suitable men. The mosquitoes were not more numerous than usual, but rather more persistent for reasons that I am not able to explain. Drinking-water was scarce on the hills owing to the dry weather in the first part of the season. During August the brush was wet almost continuously.

I have, etc.,
Jos. E. Ross, B.C.L.S.

WHITE VALLEY, SOUTH-EAST OF VERNON.

By F. H. Latimer.

November 20th, 1918.

J. E. Umbach, Esq.,
Surveyor-General, Victoria, B.C.

Sir,—Work was commenced on a group of pre-emptions lying south of the Coldstream Ranch, chiefly held by men on war service. A wagon-road leads up past Coldstream Ranch stables, with branches to several of the claims, the grade being 7 to 15 per cent., with some short steep rises up which a car can be taken with difficulty. Towards the end the grades and condition of road become impossible, except for a powerful team and light load.

Considerable wood has been taken out from some of the claims as obtained in the process of clearing, but not much other work has been done on any of the claims beyond building good cabins, also stables in some cases, and small clearings of 1 to 2 acres. All but one claim is covered with brush and timber, so that the problem of getting the land in condition for crops will be heavy, $50 to $80 per acre. Water is obtainable on all the claims, either from small streams or springs or from wells sunk in hollows.

A portion of the south end of three claims—Pre-emption Records 6482, 6581, and 6563—lies on a high rolling plateau which rises towards the south in rock cliffs varying from 75 to 150 feet in height. This plateau, so far as explored, is covered with jack-pine and balsam, with numerous natural wild grass meadows, swales, and swamps, on or around which is found thick alder, willow, birch, spruce, and balsam and occasional mountain-ash. These latter could be cleared and the necessary drains made without much difficulty, and could be made to produce considerable hay.

Access can be gained to this plateau conveniently, either up the east bank of Deer Creek in Section 8, Township 6, through a break in the cliff a short distance east of the centre of Section 4, or by way of the road and pack-trail which leads from the Coldstream Ranch through Sections 10 and 3 towards Aberdeen Lake.

The general slope and creeks on these claims fall towards the north, some of the smaller streams sinking on reaching the bottom lands of the main valley, excepting during high water.

After moving camp eight miles and surveying one pre-emption in Section 2, Township 9, in vicinity of Cousen's Bay on Long Lake, camp was moved to Section 6, Township 3 (elevation 3,400 feet), on south slope of a group of high rock peaks called by some "Bluenose," which form a prominent landmark when coming out from Vernon on the White Valley Road.

Five claims were surveyed in the vicinity of this camp, two of which are being occupied and improved and cultivated, the remainder being held by men overseas. All these lands have been covered with timber at one time, but have in considerable part been overrun by fire, and

in South Half of Section 12 has left very little except standing dead stubs, windfall, and a heavy second growth of willow, tamarack, and alder. On the remainder the timber is chiefly tamarack and fir, with the addition of cedar, balsam, and a little spruce next the streams or in hollows, but not in commercial quantities. In most cases the disposal of the wood as cord or stove wood will assist in carrying the settler along while clearing the land, though the haul to the only market—Vernon—is about thirteen to fifteen miles.

A good wagon-road (excepting that grades run up to 12 or 15 per cent. in some places, going south) runs from the main valley through Sections 7 and 6 to south-west corner of Lot 4162, from whence one settler's wagon-road leads through Lot 4174 to Lot 4175, the other branch going south to north-west corner of Lot 4172, continuing from the latter point southerly to a group of lakes, swamps, and natural meadows, including Summit Lake, Fish Lakes, Haddo Lake, and Aberdeen Lake. On the two latter, dams have been constructed to store water for the Grey Canal, these lakes being one of the sources of Jones Creek, from which creek the Grey Canal is diverted near the south-west corner of Lot 3654 (in Section 8, Township 3).

Having completed the survey of these claims, camp was moved to near a watercourse close to south-east corner of Lot 3521, from which three claims were surveyed and designated as Lots 4528, 4530, and 4531, all of which are held by men overseas. Not much work has been done on any of them except in building cabins, small clearings, and making trails on which to get from wagon-road to the cabins.

The well-cut-out pack-trail previously mentioned as leading from the Coldstream Ranch to Aberdeen Lake passes diagonally across Lot 4530. I have been informed that much of the cement and supplies required in construction of dam on Aberdeen Lake was packed in over this trail.

In general, these claims are situated on a high rolling plateau covered with jack-pine, some tamarack and balsam, with many natural hay meadows, marshes, and lakes, in the latter of which is good trout-fishing. The clearing on these meadows is generally light, and the soil a deep black loam or muck that can be easily drained.

The elevation of this plateau is rather high (about 3,400 feet) and is subject to late spring and early fall frosts, though the first frost this season was on September 25th, and the first snow in Camp No. 4 being a light fall of 1 inch on October 22nd, followed by a fall of 2 inches on October 23rd and 24th.

Camp was next moved to vicinity of south-east corner of Lot 3654 (Section 9, Township 3), the distance in an air-line from Camp No. 3 being two miles, but requiring a travel of fourteen miles by way of Lots 435, 432, 436, and 3654, owing to intervening deep valley and canyon of Jones Creek and existing roads. The last half a mile before reaching camp is up a very steep, rough, and sideling settler's road, though a good road can be made with moderate expense, the distance from Vernon by most direct route being sixteen miles. The elevation of this camp was approximately 2,790 feet near H. Ashman's house.

Four claims were surveyed from this camp, two of which are for men overseas. These claims have also been all covered with timber-growth, chiefly consisting of tamarack and fir, with addition of considerable cedar and balsam in creek-valleys. Jones Creek lies to the west of this group, and along the east an unnamed small tributary of Harris Creek runs. At the time of survey there was only running in this latter tributary about ¼ second-foot, but the appearance of the creek-channel would indicate that the stream must be of considerable size during high water.

Portions of these claims are on high knolls or ridges, on which the soil is light, with considerable rock, but the benches are of a clayey loam, and there are indications of considerable underground seepage coming out as springs near the creeks mentioned in preceding paragraph.

Heavy rains set in while at this camp during the last week of October and first week in November, accompanied by thick mists, the rain showing as snow at an elevation of about 1,500 feet above camp.

Very little game was seen this season, though numerous deer-tracks were observed to the east of Long Lake and some on Upper Jones Creek. A few black bear are in the vicinity, and a limited number of blue, willow, and Franklin grouse.

Timothy was seen growing in many places over or in the vicinity of the pre-emptions surveyed, particularly near Camps 3 and 4 on Lots 4165, 4162, 4173, 4163, 4164, 3521, 4174, and 4175, also in Sections 9 and 10, Township 6.

I have, etc.,

F. H. Latimer, B.C.L.S.

VICINITY OF SUMMERLAND, OSOYOOS DISTRICT.

By B. A. Moorhouse.

December 17th, 1918.

J. E. Umbach, Esq.,
Surveyor-General, Victoria, B.C.

Sir,—I have the honour to submit the following report on my season's work during 1918 in the vicinity of Okanagan Lake:—

Following your instructions, surveys were made of scattered pre-emptions, some of which had been held under record for a number of years, situated on the west side of Okanagan Lake from the Municipality of Summerland on the south to Wilson's Landing on the north, which latter point is nearly opposite Kelowna. This district takes in the towns of Summerland and Peachland, and also the smaller settlements of Minneola and Altamont on the west and Glenrosa and Westbank on the north.

Owing to the district being well supplied with roads fit for motor travel, which connect the settlements and also have branches up most of the small valleys down which the numerous creeks flow to Okanagan Lake, the lands under consideration are more accessible and to that extent more valuable than the majority of pre-emption holdings in some parts of the Province.

Generally speaking, the lands in the valleys nearer Summerland are already planted to orchards and yield splendid crops of the best fruit and other produce, as they have a successful irrigation system practically ensuring certain harvest each year.

The first camp was located one mile west of Faulder, which is a small station on the Kettle Valley Railway about seventeen miles west of Penticton, on the Coast-Kootenay branch of the Canadian Pacific Railway, and about ten miles west of Summerland by road. From Faulder this road turns north to Fish Lake, about eight miles up the Darke Creek Valley, passing through the little sawmill town of Minneola, about half-way. Minneola has a school, post-office, store, and a few good houses and many other buildings surrounding the sawmill.

The land to be inspected before survey operations were possible was so grouped at great distances apart that it is only possible to report upon the same in groups.

In the valley of Darke Creek, in which Minneola is situated, all the bottom and side-hill lands are rapidly being denuded of the merchantable timber, leaving the lands in an easier state for preparation as farm and orchand lands, which will be possible as soon as a successful irrigation system is completed.

In the southern portion of the valley below Minneola sawmill there is at present very little of even the bottom lands under cultivation, as all the water from Darke Creek is used by the sawmill, thus depriving land-owners of water for agriculture; but to the north of Minneola some of the land at present under cultivation suggests the possibilities and proves the producing value of the land even under the uncertain flow of water for irrigation from Darke Creek.

Five pre-emptions and three lots were surveyed adjacent to the townsite of Minneola; the soil on the benches and hillsides being a good sandy loam, excellent for fruit land if irrigation could be applied thereon. The majority of the lots contain excellent pasture, and on some parts hay and other crops could be grown when the normal supply of water from Darke Creek is again available.

The sawmill at Minneola has about completed its work of cutting timber from some 2,000 acres of land, most of which is now semi-ready for irrigation, and some of the surveyed lots along with the longer-established pre-emptions will likely be divided into small fruit-farms when a comprehensive irrigation system is assured.

Two pre-emptions were surveyed nearer to Fish Lake, the owners having done considerable improvements.

Four places were surveyed to the west of Faulder as far as Canyon Creek and on the south side of Trout Creek, which lands lie at an elevation of from 500 to 800 feet above Trout Creek on the summit between it and Shingle Creek. A fairly passable road goes through this property and connects with both Penticton and Summerland.

The land here was mostly used for range. There were some 200 sheep and many cattle pasturing there this summer. The accessibility to water is of prime importance, and for this reason the survey of Lot 4457 was diverted from usual methods in order to utilize Trout Creek.

This district is very park-like, slightly sloping to the north and south from the summit,

where several small lakes and a few excellent springs are to be found. The timber is mostly fir and pine scattered over the land, intermingled with dense patches of young willow and other growths. This part of the country appears to be a sportsman's paradise, as deer and duck have been found there in large numbers.

Some pre-emptions directly north of this district across Trout Creek were inspected and found to be at present not sufficiently useful to warrant survey, the barren hillside lands being particularly dry, as all the springs during the last few hot summers have disappeared, to the detriment of the land-owners high up near the summit.

Three pre-emptions surveyed were within the limits of the Municipality of Summerland, the owners all appreciating the value of having their places surveyed. The proximity of these lands to the 10 acres of orchards make them particularly useful for near-by pasture lands.

In all, eighteen places were surveyed from Camp No. 1 and seven inspections made.

Camp was moved by the Kettle Valley Railway up to the Trout Creek Valley a distance of fourteen miles to Altamont, a busy sawmill community at which there is a store, post-office, many houses, and station, etc. The mill here has turned the timber from the surrounding hillsides into lumber available for buildings, etc., and incidentally made the lands more easily prepared for cultivation.

Of the five places surveyed here, four belonged to soldiers who will no doubt return to further develop their lands, as the soil generally is good sandy and black loam, and where irrigation can be placed thereon; fairly level and easily cleared. The hillsides are covered with bunch-grass and make good range for cattle.

An old wagon-road from Altamont to Faulder and also farther west along the railway to Osprey Lake requires some repairs in order that when needed by settlers a fair road can be got to Summerland. Some of these places have small natural meadows easily made irrigable from Trout Creek. On the south side of the creek the hills are densely covered with black pine.

The next move was to Deep Creek, which is close to the southern boundary of Peachland, and along this creek twelve pre-emptions were inspected, of which seven were surveyed; also certain tie lines, etc., made.

These lots to the south of Deep Creek on the adjoining high plateau between Deep and Eneas Creeks are all the property of soldiers, and now used solely for range purposes; but there is some level land with rich black loam soil, and also some small natural meadows which are easily cultivable. The majority of the land is rolling bunch-grass range with scattered fir and pine, with dense clumps of willow and other small brush in places. Water for domestic purposes is scarce.

There is an old construction-road which can be repaired in order to give these pre-emptions access to Peachland when necessary.

Other scattered pre-emptions were surveyed up the South Fork of Deep Creek, most of the lands being covered by dense young jack-pine, except for the natural open meadows to be found near the summit of the divide between Deep and Trout Creeks. The Peachland Municipality and others use the meadows and reservoirs for storage of irrigation-water during the season. There is a fair road right to the summit, where construction of dams has taken place a few years ago.

Surveys were also made up Trepanier Creek, but owing to the absence overseas of owners, these, with many other places surveyed this season, are either idle or used solely for range land; but upon the return of the owners these places should receive a new lease of usefulness, especially when it is realized that the places are now entirely the property of the soldier pre-emptors by Crown grant from the Government.

Inspections were made of Westbank and Glenrosa properties and two places surveyed up near Bear Creek.

The season was exceptionally fine for outdoor work and the district fairly free from forest fires. No summer frosts, and no accidents of any kind occurred.

I have, etc.,

B. A. Moorhouse, B.C.L.S.

VICINITY OF FAIRVIEW, SIMILKAMEEN DISTRICT.

By C. A. E. Shaw.

November 27th, 1918.

J. E. Umbach, Esq.,
Surveyor-General, Victoria, B.C.

Sir,—I have the honour to report that under your instructions I made surveys of a number of pre-emptions between Fairview and the International Boundary-line on that part of the range lying between the Okanagan and Similkameen Valleys.

This range is rolling and broken with deep valleys and a number of small lakes, some of them salt, and one (Spotted Lake) has been worked extensively for Epsom salts, some thousands of tons having already been shipped from it. The hills are usually clear of timber on the south slopes and covered with bunch-grass, but on the north are generally timbered, mostly with fir of fair size and quality, and many of the valleys have groves of cottonwood in them.

The soil of this range is usually of excellent quality, deep black loam with clay subsoil. Dry seasons are the great drawback to this district, the past season being the worst on record in this respect. Many springs and streams were dry for the first time on record, and the crops, where irrigation was impossible, were practically a failure. On this account nearly all the settlers whose land was being surveyed were away from home working elsewhere.

The climate of the Okanagan and Similkameen Valley is mild, with a long summer season. Snow falls on the hills, but very seldom lies in the valleys. The rainfall is light, and summer frosts are practically unknown in the valleys. Where water for irrigation purposes can be obtained, all the tender fruits and vegetables, such as peaches and tomatoes of the finest quality, can be grown in abundance. At Keremeos, for instance, a few miles to the west, where a cannery was built about three years ago, 100 tons of tomatoes a day were delivered during the season; and I have no hesitation in saying that when the Okanagan and Similkameen Valleys are placed under irrigation they will be able to supply not only British Columbia, but also the Province to the east, with all those species of tender vegetables and fruit that are with difficulty raised elsewhere.

Fairview, which is the mail centre for this (Okanagan) district, consists of a post-office, store, and a few houses; the Government offices are also located here. It is situated in the Okanagan Valley about twelve miles north of the International Boundary-line. Penticton, the market town for the district, is about thirty-two miles farther north at the south end of Okanagan Lake. Excellent roads connect the two places, and the Kettle Valley Railway, which passes through Penticton, provides transportation to the Coast and also to the East. Steamers on Okanagan Lake provide access to Vernon and also to Sicamous, on the main line of the Canadian Pacific Railway. There is also a wagon-road from Fairview to Keremeos, sixteen miles to the west, and farther south a road runs through the Richter Pass to the Lower Similkameen. This in the future is intended to form a link in the International Highway. There are also two good roads leading east to the Boundary country—one from Fairview and one from Osoyoos, about ten miles south, where it crosses a narrow point in the lake of that name. The road through Richter Pass connects with this.

Deer are fairly plentiful in the higher ranges of the district. There are mountain sheep and goats in certain sections. Grouse are plentiful. There are scattered flocks of prairie-chicken, and in the fall and winter ducks are numerous in the Osoyoos and other lakes in the valley. Geese are also to be found at times, and in Vaseaux Lake a flock of swans has remained winter and summer for many years. Pheasants and quail were introduced into the Okanagan and Similkameen Valleys about four years ago and are now becoming fairly plentiful. In Osoyoos Lake, which is the lowest point in the interior of British Columbia (986 feet above sea-level), are various species of trout. Carp, which were introduced some years ago, are numerous, and in the fall a species of red salmon from the sea come up in large numbers to spawn.

I have, etc.,
C. A. E. Shaw, B.C.L.S.

NICOLA VALLEY, KAMLOOPS DIVISION, YALE DISTRICT.

By O. B. N. Wilkie.

October 9th, 1918.

J. E. Umbach, Esq.,
Surveyor-General, Victoria, B.C.

Sir,—I have the honour to submit the following report of the country surveyed during the past season in Nicola Valley:—

Merritt is the principal town in this section and is reached by the Kettle Valley Railway, being forty miles in a southerly direction from Spences Bridge, on the Canadian Pacific Railway. From Merritt the Kettle Valley operates trains through Southern British Columbia, connecting at Princeton with United States railway-lines and giving a direct route to travel from the States through Spokane by way of Princeton to Merritt.

Merritt is a thriving little city of about 1,500 inhabitants, the principal industries being its coal-mines, which furnish employment for a large number of men. Business is represented by two large departmental stores, one drug-store, three general stores, one men's furnishing goods store, two meat markets, and several other smaller shops of various kinds. It has two banks, two garages, and owns its own water and electric-lighting plants.

Agriculture in the Valley.

Merritt is the centre of a considerable agricultural community and good Government roads radiate from it in all directions. General farming is successfully carried on, the land requiring irrigation for the most part to grow good crops.

Dry-farming is being tried out. A dry-farming experimental station established by the Government has been in operation for the past five years above Quilchena, at the head of the valley, at an elevation of 3,800 feet. Splendid cereal crops have been produced there under scientific dry-farming methods. One year it produced a yield of 90 bushels of oats to the acre.

The altitude of the valley within a radius of fifteen miles from Merritt ranges from 1,500 to 2,000 feet, while the upper portion reaches about 2,600 feet. However, farming is carried on at elevations of 4,000 feet in the sections surrounding it, but the ranchers on the higher levels make stock-raising their principal source of income.

Crops grown.

All the staple varieties of vegetables do well in the valley and all small fruits can be grown successfully. It is not considered a fruit district, but certain varieties of tree-fruits can be grown. The Government has a small orchard at Lower Nicola, about five miles below Merritt, and the trees are doing very well. Good crops of wheat, oats, barley, and rye are produced, and hay is a staple product. Merritt furnishes a good market for produce. Poultry does well here and the district is especially adapted for turkey-raising.

Stock-raising.

There are many large cattle-ranches in this vicinity, and practically all the ranchers go in for stock-raising more or less. Sheep-raising is coming to the front and promises to become one of the important industries of the section. Considerable pork is produced. The "porkers" raised here are singularly free from disease and hog-cholera is practically unknown. There is excellent grazing for cattle and sheep in the hills surrounding the valley, and cattle run out on the open range till well along in the winter.

The valley needs a good creamery, and it would undoubtedly be of great benefit to all the settlers.

Climate.

The climate of this valley is certainly one of its greatest assets. Glorious sunshine and clear, bracing atmosphere make it an ideal place of residence for those in search of health. The summers are mild, the nights always cool, while the winters are clear and cold, with medium snowfall. Motor-cars continue in use on the roads most of the winter season. Summer frosts occur very seldom. You may say they are an exception and not the rule.

MINING.

In addition to the coal-mines spoken of above, considerable interest is taken in the development of mining for gold, silver, copper, iron, gypsum, etc., in the territory adjacent. The prospects for the development of the mining industry in general look very promising. Several properties are being worked at the present time.

LUMBERING.

At the lower end of the valley near Canford the Nicola Valley Pine Lumber Company has a large plant, and the getting-out of logs for this mill has been a profitable source of income to settlers. The logging camps up the Coldwater River employ many men. The timber is principally pine and fir, running about 5,000 or 6,000 feet to the acre.

NICOLA LAKE.

Nicola Lake, whence flows the Nicola River, from which the valley takes its name, is one of the beauty-spots of this section. It is seventeen miles long and about two miles wide and is an ideal fishing resort. In fact, all the streams and lakes in this vicinity furnish excellent sport for the enthusiastic trout-fishers.

The town of Nicola is situated at the foot of the lake, and here the Government office for the district is located. It also has the distinction of being the oldest town in the valley. A branch line of the Kettle Valley Railway extends from Merritt to Nicola.

My party proceeded from Merritt by wagon-road to a point near Midday Creek, about six miles in a south-westerly direction. Here we surveyed twelve parcels of land, of approximately 160 acres each, for settlement by returned soldiers. Also some other pre-emptions.

This land has an elevation of about 3,000 feet. It is undulating country with some open land, with groves of small poplars and willows. There are also portions with a fair growth of pine and fir, running about 2,500 to 3,000 feet to the acre.

In regard to clearing the land for crops, it would cost in the neighbourhood of $50 per acre to clear the poplar and willow patches. The pine and fir areas I consider would be unfit for cultivation, but would make good pasture.

Several streams run through these parcels of land which would furnish irrigation in the early part of the summer. They were dry, with the exception of a few pools at intervals, at the end of July. The soil is gravelly loam, very similar to that of the Quilchena Dry Farm. There is a road open into these lands and it is only three miles from Walkerville, a flag-station on the Kettle Valley Railway.

From here we moved to Rey Lake, a distance of thirty miles north of Merritt, a wagon-trail being open to it. Here we surveyed several pre-emptions, principally owned by men on active service. This lake lies at an elevation of 4,000 feet, the country adjacent being undulating, with patches of small poplar. The timber on the wooded slopes consists of black pine and fir, which cannot be considered of commercial value as the fir is not of good quality. Considerable clearing has been made of the poplar groves by the pre-emptors. There are several large natural hay meadows on the east side of Rey Lake on which wild hay is cut and cattle wintered. Summer frosts were observed in August.

From this point we went on to Mamete Lake and surveyed some isolated pre-emptions taken up by men who are now at the Front. The general character of the country is similar to that of Rey Lake, with the exception that the timber is of better quality and the elevation is about 3,200 feet.

There are several large ranches located in the valley adjacent to Mamete Lake.

We proceeded from there to Eight-mile Creek and surveyed a few soldiers' pre-emptions. In this section most of the land cleared is sloping hillside and the elevation is around 4,000 feet. Hay and grain are the principal products. Some sheep-raising is carried on.

From Eight-mile Creek we moved on to the north end of Nicola Lake, where we also surveyed some pre-emptions. With the exception of the lands laid out for settlement by soldiers, our duties throughout the season were mostly confined to the pre-emptions previously taken up by men who are at the Front.

All through this section the lands in the valleys have been taken up years ago and are now productive ranches. Hence, new settlers looking for Government lands must go farther afield. However, throughout all these mountain districts one finds bench land and small valleys which

make good farms when cleared and put under cultivation. We noticed many such small holdings in process of development and found settlers doing well with them. The soil is good, and the many small streams furnish water for irrigation purposes, which can be put on the land at small cost.

Hunters and trappers find a variety of game in the mountains and along the streams. Deer is plentiful, as well as bear, lynx, and coyotes. There are beaver, mink, and ermine along the streams. In the way of game birds, ruffled and willow grouse are here in abundance, and the many lakes provide a happy hunting-ground for ducks and geese in the fall of the year.

A government telephone system connects Merritt with the district and also with most parts of British Columbia.

I have, etc.,
O. B. N. Wilkie, B.C.L.S.

VICINITY OF PRINCETON, KAMLOOPS DISTRICT.

By P. W. Gregory.

November 23rd, 1918.

J. E. Umbach, Esq.,
Surveyor-General, Victoria, B.C.

Sir,—I have the honour to submit herewith the following report upon the lands surveyed by me during the past season:—

The work comprised the survey of pre-emptions situated along Allison (One-mile) Creek, Hayes (Five-mile) Creek, and Summers Creek, flowing into the Similkameen River near Princeton from the north.

In all, forty-six pre-emptions were included in your instructions, and, as specified, none were surveyed unless occupied or improved or found to belong to men engaged on military service. Forty only of the forty-six pre-emptions were examined, reported on, or surveyed, when it was deemed advisable to bring the field-work to an end. Of these forty, nineteen only fulfilled the required conditions and were surveyed, whilst twenty-one, being unimproved and apparently abandoned, were not surveyed. Of the nineteen surveyed, five belonged to men absent on military duties, eight only were under occupation at the time of survey, and six were considered sufficiently improved to warrant completion of the surveys.

It would appear unnecessary for me to again describe the district in this vicinity, as it was covered in my report on the season's work for 1916. Mention, however, should be made of the present activity due to railway-construction and mining development. The Kettle Valley Railway has in course of construction a branch line from Princeton to the mine of the Canada Copper Corporation, Limited, a distance of about fourteen miles, which will probably be finished towards the end of next summer.

Three miles south of the town this mining company is erecting a concentration-mill for the treatment of its ores by the oil-flotation process which will have a 2,000-ton daily capacity. Around the mill the small town of Allenby has sprung into existence.

The lands surveyed by me during the season lie generally along the creeks mentioned, and they are readily accessible by roads from Princeton following the creek-valleys. A Ford car was used in moving men and equipment from point to point, and proved indispensable, as horses were almost impossible to hire, the demand being far greater than the supply, a condition applying also this year in a degree to men. The valleys are all narrow, varying from a quarter to three-quarters of a mile wide. The pre-emptions concerned were seldom found to include more than a third of their area of bottom land, the greater part lying along the steep hillsides and benches bordering the creeks. The growth along the bottoms is usually dense, consisting of willow, alder, poplar, and birch, whilst the hillsides and benches are timbered with fir and yellow pine from 12 to 50 inches in diameter. The soil in the bottoms is a rich loam and on the hillsides and benches sandy and frequently very rocky.

Along Allison (One-mile) Creek a wagon-road extends from Princeton northward a distance of about twenty miles, still lacking about eight miles to connect up with the main road from Merritt passing through Aspen Grove. If completed, this route will shorten the distance between Merritt and Princeton by some sixteen miles, making the journey fifty-six as compared with

seventy-two miles over the present travelled route via Tulameen and Otter Valley. Several small but none the less picturesque lakes are encountered through this valley, around which the wagon-road winds, affording additional attraction to the traveller. There are five or six ranches along Allison Creek devoted to mixed farming, the tilling of the soil, the rearing of cattle, sheep, and poultry, and the making of butter. Good crops of hay, grain, and vegetables were seen.

The valley of Hayes Creek, better known as Five-mile Creek, is wider than that of Allison Creek, but lacks adjoining range lands. Here also is a moderately good wagon-road following the creek, but wanting a few miles of construction to link up with the road running westward from Summerland and the Okanagan Lake. Osprey Lake is the present limit of the road on the Princeton side.

The valley of Summers Creek is very similar to that of Allison Creek, to which it is tributary. A road extends as far north along it as Lot 3348, from whence a good pack-trail leads on a water-grade to Missezula Lake, a distance of eight miles.

The country generally covered in my surveying operations is mineralized. Exposures occur along the hillsides flanking the valleys, showing deposits of copper ores, and along Allison Creek, magnetite. Outcroppings of coal are to be seen along Summers Creek, being probably the northerly fringe of the Princeton coal-basin, extending southerly eleven or twelve miles to the foot-hills of Copper Mountain, and estimated to cover an area upwards of forty square miles. The coal is sub-bituminous. Only one company—the Princeton Coal and Land Company, Limited—is actively engaged in coal-mining in this basin. The coal is shipped to Vancouver, Vancouver Island, and many points in the Interior served by the Kettle Valley and Canadian Pacific Railways, as well as to a number of points in the neighbouring State of Washington. The output for the twelve months ending March 31st, 1918, was about 44,000 tons, of which about 14,000 tons were sent across the International Boundary.

The West Kootenay Power and Light Company, Limited, which derives its energy from Bonnington Falls, has under construction a power-transmission line to the mill of the Canada Copper Corporation at Allenby, to which allusion has previously been made, and it is understood that provision will be made for the supply of power for other industries within this district.

The local need is not so much the settler to clear and cultivate the land as capital in the hands of capable mining men taking advantage of the special facilities afforded to develop the mineral resources. A great deal of work has been done in prospecting by W. C. McDougall and his associates on the Regal Group, Allison Creek, and by Uhler and Cox on the Shamrock Group, Hayes Creek.

Our surveying operations took us to Red Creek, a tributary of Hayes Creek. This region of the country was thoroughly burned over by forest fires in the summer of 1914, in effect clearing a way for the prospector through the dense tangle of jack-pine, underbrush, and windfalls formerly covering this watershed. As a consequence several promising locations have since been made.

I have, etc.,
P. W. GREGORY, B.C.L.S.

LOWER MAINLAND COAST AND ISLAND, NEW WESTMINSTER, AND COAST DISTRICT, RANGE 1.

BY H. H. ROBERTS.

November 12th, 1918.

J. E. Umbach, Esq.,
Surveyor-General, Victoria, B.C.

SIR,—I have the honour to submit the following report upon the surveys carried out by me in New Westminster District and Range 1, Coast District, during approximately two months of the past survey season:—

In organizing my party, your instructions that preference should be given returned soldiers over other applicants and that men should not be drawn from industries connected with the war were carried out. A gasolene-launch and a rowboat fitted with an Evinrude engine facilitated the work and added to the efficiency of the party. The work allotted to me consisted chiefly of

the survey of unsurveyed pre-emptions on Cortes and Redonda Islands; on the Mainland, work extended from the vicinity of Melanie Cove, Desolation Sound, northwards to Churchhouse, near the entrance to Bute Inlet.

Redonda Islands.

The islands, known as the East and West Redonda, are situate near the entrance to Toba Inlet, being separated from the Mainland by Pryce and Homfray Channels and Desolation Sound. Waddington Channel leads from Desolation Sound north-westward between the two islands. About three miles from the south-easterly entrance of Waddington Channel, Pendrell Sound branches off to the northward, extending six miles, with an average width of three-quarters of a mile, and nearly dividing Redonda Island into two parts.

The work at West Redonda Island consisted of the survey of one piece of vacant Crown land adjacent to surveys made by me in 1917 and fronting on Black Lake. Black Lake is situated in the south-east portion of the island and drains into Salt Lagoon, Waddington Channel. Lot No. 5015 was assigned to this parcel, which contains an area of 96 acres, of which about 10 acres are first-class land.

On the East Redonda the land rises to a great height, and the country is extremely rugged, making surveying operations difficult and in many places impossible.

Lots 5017 to 5020 are situated on the east side of the East Redonda, and all of them front on Homfray Channel, with the exception of Lot 5019, which is separated from this channel by Crown-granted Lot 3628. The areas of good land on these lots are limited. The settler on Lot 5018 possesses an exceptionally fine garden producing potatoes, carrots, turnips, cabbages, onions, cucumbers, and apples. The same settler has found hogs serviceable in clearing and preparing land for cultivation.

Mainland.

Of surveys on or near the Mainland, that of Eveleigh Island was the southernmost. This island lies at the entrance to Melanie Cove, which is situated in the north-east part of Desolation Sound. It is about three-quarters of a mile in length, with a maximum width of a quarter of a mile, and is separated from the Mainland by a narrow passage which dries at low tide. This island was recently logged, and at the time of survey the smoke from the burning of logging debris made it difficult to make accurate triangulation ties to surveys on the Mainland and Redonda Islands. Eveleigh Island is low-lying and for the most part rocky and broken, with scattered areas of land carrying a light soil. Practically all the timber of merchantable value has been logged off, the standing trees being chiefly scrub fir, cedar, and hemlock.

Homfray Channel is about fifteen miles long, being a continuation northward of Desolation Sound. My instructions called for the survey of six pre-emptions on that portion of the Mainland fronting on this channel. Only two of these pre-emptions were included in my work, the other claims being unoccupied, unimproved, and (excepting one parcel which carried more than the statutory amount of timber) not particularly suitable for settlement.

Lot 5016, fronting on Homfray Channel, is about three-quarters of a mile south of Lloyd Point, which is a point of call for steamers and has a post-office. This area was recorded in favour of a pre-emptor on military service who has made the supreme sacrifice. It contains little land of agricultural value, but carries a considerable amount of fallen cedar which will be suitable for shingle-bolts.

Lot 1834 is near Atwood Bay, in the northern end of Homfray Channel. This parcel contains 185 acres, of which 15 acres are classified as first-class land. The settler's improvements consist of a house and garden.

The Mainland in the vicinity of Homfray Channel was at one time covered with a good growth of fir, cedar, and hemlock, but a greater part of the timber has been logged or destroyed by fire. Large areas are now covered by a second growth of fir, hemlock, and alder.

Churchhouse.

Churchhouse is the name given to an Indian settlement on the Mainland near the northerly end of Calm Channel. This channel is nine miles long in a north-westerly direction, and lies north of Lewis and Sutil Channels, leading from them to Bute Inlet; its shores rise abruptly to a great height. At Churchhouse a pre-emption adjoining the Indian reserve was surveyed. The question as to the boundaries of this pre-emption has in the past been the cause of considerable friction between the settler and the Indians, but it is hoped that the adjustment of

the boundaries will prove satisfactory to all parties. Churchhouse has a good store and post-office and is furnished with a weekly boat service by the Union Steamship Company. The chief occupation of the Indians is fishing and hand-logging.

CORTES ISLAND.

Cortes Island is situated at the head of the Strait of Georgia, lying between Read Island and the Redonda Islands. The island is well settled and is traversed by several good roads and trails. The chief settlements are at Manson's Landing and Whaletown on the west side of the island, and in the vicinity of Seaford and Squirrel Cove on the easterly side. These points have stores and post-offices and are well served by boats of the Union Steamship Company. Section 12 and portion of Section 13, situated in the south-east portion of Cortes Island, were subdivided into seven parcels, varying in area from 80 to 160 acres and held under pre-emption records. With one exception, all the settlers are in active occupations, and their improvements consist mainly of houses, outbuildings, gardens, and clearing.

GENERAL REMARKS.

The vicinity of the season's work is about a fourteen hours' journey from Vancouver, and is supplied with a good boat service by the Union Steamship Company. Some of the settlers are engaged for a considerable portion of the year either in logging camps or at hand-logging; others, during the summer and fall, are occupied with fishing, the principal waters being Toba Inlet and Bute Inlet.

In the logging camps, summer resorts, Powell River, and Vancouver the settlers have good markets for everything that they can produce.

I have, etc.,

H. H. ROBERTS, B.C.L.S.

QUEEN CHARLOTTE SOUND, COAST DISTRICT, RANGE 1.

BY JNO. ELLIOTT.

November 18th, 1918.

J. E. Umbach, Esq.,
Surveyor-General, Victoria, B.C.

SIR,—I have the honour to submit the following report on the work done during the past summer:—

This work consisted of a survey of the mainland shore of Queen Charlotte Sound and portions of contiguous waters from Shelter Bay to the mouth of Smith Sound, also of two pre-emptions on Branham Island and eight others on the shore of the sound east of Blunden Harbour.

Along such portions of this shore as are exposed to the open sound all vegetation has been destroyed within the limits of the area reached by the surf, and for some distance farther the trees are all stunted and distorted into most fantastic shapes by force of the winds, which at times must be very great. But where the shore is sheltered by adjacent islands and in the lagoons and inlets the forests come to the water's edge, and at high tide the lower branches sweep the water. About midway between Buccleugh and Rayner Points there is a striking exception to the above description; there, for about two miles and a half, lies a stretch of firm sandy beach which if close to some large centre of population would no doubt be of great value as a summer resort. Behind this beach lies a strip of low-lying level land covered with small scrubby timber, and which appears to connect by a low pass with the westerly end of Belize Inlet.

There are indications of coal in several places. A number of claims have been staked and in some cases surveyed, and some prospecting has been done, but with what success I do not know. I saw no traces of any other mineral.

Deer are plentiful all along the Coast, and during the migratory season great numbers of wild geese are to be found in any of the bays in which a large area of tide-flat occurs. Beavers must have been plentiful some years ago, and from signs found this year I believe that they are again slowly increasing in numbers.

There is a salmon-cannery in Nugent Sound, off Seymour Inlet, and a considerable number of hand-loggers scattered along the main inlet and its various tributary inlets, sounds, and lagoons, and these are so far the only industries in this district.

The nearest port of call for steamers is Hardy Bay, on Vancouver Island, communication with which is usually by gasolene-launch; and the possession of a good boat is, in fact, the first requisite of any one intending to do anything in this locality.

So far there has been no settlement along this shore on the Mainland, but on Branham Island, lying off the mouth of Seymour Inlet, several pre-emptions have been recorded, though very few of them have been occupied. This island is separated from the Mainland on the east by Schooner Pass, which in places is not over 250 feet wide, and on the north by Slingsby Channel, having a width of about half a mile; in both these channels the tidal current is very strong, attaining a velocity of over ten miles an hour in portions of Slingsby Channel, but on the south and west the island is exposed to the open sound.

In consequence of this, while the north-easterly part of the island carries the amount of timber normal to this region, the south-westerly portion is much more lightly wooded and contains considerable areas of open grassy land, usually very wet and nearly always broken by rock-outcroppings. If the wild grass could be supplanted by tame without having to do any extensive cultivation of the soil, it might be possible to do something with stock, but, failing this, I do not think that any other kind of farming would prove successful.

The pre-emptions surveyed east of Blunden Harbour are similar to adjacent lands surveyed and described last year, the only difference noted being the number of small lakes met with this year. These lakes, though they could be lowered somewhat by breaking the beaver-dams at the outlets, are so deep and their beds of such contour that such lowering would be of little benefit.

I have, etc.,

John Elliott, B.C.L.S.

RIVERS INLET, FITZHUGH SOUND, AND BURKE CHANNEL, COAST DISTRICT, RANGES 2 AND 3.

By C. C. Smith.

December 19th, 1918.

J. E. Umbach, Esq.,
Surveyor-General, Victoria, B.C.

Sir,—With reference to my surveys carried out for your Department during the past season, I have the honour to report as follows:—

My work consisted principally of tie traverses, shore traverse, and triangulations extending from the North Arm of Moses Inlet, through Rivers Inlet, Fitzhugh Sound, and Burke Channel to Labouchere Channel. My outfit consisted of one 40-foot launch, one Linton rowboat, one small rowboat, and a Peterborough canoe. An Evinrude motor was used in the large rowboat.

As was the case last year, the old surveys of the lots were very hard to find. For instance, all trace of the survey of Lot 2 at Koeye River has been obliterated, and the only evidence remaining of the position of the lot is the shape of the shore-line. In order to facilitate adjoining surveys it is very desirable that these lots should be resurveyed.

In traverse and triangulation the same methods were employed as I used last year. In the triangulation of Fitzhugh Sound some of the sides of the triangles were very long and targets were erected with four cross-heads, two being 1 foot x 6 inches and two being 1½ x 4 feet.

At the southerly end of this triangulation a base approximately three miles long was measured by stadia, and at the northerly end, at Restoration Bay, a base 65 chains long was chained as accurately as possible without using base-measuring apparatus.

Agricultural Possibilities.

Of the land bordering the shore from the head of Moses Inlet, around by Schooner Pass, up Fitzhugh Sound, and along Burke Channel to Labouchere Channel, there is none that a settler could improve and make a living on under present conditions. There are a few acres around the mouths of some of the creeks that would contribute to the support of a settler's home if he had other means of support. There are some areas of partly open meadows similar to the

pre-empted areas at Millbrook Cove and Takush, on which an experimental farm would appear to be a capital investment, as these will not grow timber and might by some method of treatment yet unknown be made capable of agricultural development.

Other Industries.

At present fishing and logging are the industries being carried on, and with proper conservation these industries can be made perpetual here. Approximately 800 people engage in fishing in these waters during the fishing season, which lasts about two months. One man alone made $1,800 that I know of, and some may have made more. An average would probably be $500. But unless some limit is put on the catch the industry is threatened with extinction. As yet salmon is the only fish caught, but there are herring, cod, and other species which will permit of the industry being carried out during a longer season.

The country is almost all heavily timbered with cedar, hemlock, balsam, and spruce. Excepting in the creek-valleys, the timber is of medium grade and is not large. So far only the large timber in the creek-bottoms has been logged, but the supply of this is limited, and the high-lead system of logging is leaving a great deal of waste. Before long the pulp-mills will have to use more cordwood, and this will give permanent work for a large number of small operators.

This part of the Coast is well stocked with game. Deer are plentiful, as also are black bear and goat. Marten, mink, fox, bear, and wolf are caught in fair quantity by the trappers.

On account of the many small bays and harbours these waters are splendid for small-boat transportation. In the late summer and fall, however, Burke Channel becomes very rough occasionally. North winds strike it suddenly and violently, and as the tide runs strongly the seas become very choppy. In Fitzhugh Sound, Safety Cove, Goldstream Harbour, and Namu are the main harbours, but many other bays are available for launches.

I have, etc.,
C. C. Smith, B.C.L.S.

CUMSHEWA INLET, QUEEN CHARLOTTE ISLANDS, AND ROSCOE INLET, COAST DISTRICT, RANGE 3.

By A. E. Wright.

December 10th, 1918.

J. E. Umbach, Esq.,
Surveyor-General, Victoria, B.C.

Sir,—I have the honour to submit the following report on the economic conditions in the area contiguous to my survey operations while triangulating in the vicinity of Cumshewa and Selwyn Inlets, Moresby Island, and in the vicinity of Roscoe Inlet near Ocean Falls.

Cumshewa Inlet.

This is an inlet about eighteen miles long and one mile and a half wide, separating Louise and Moresby Islands. Its shores are for the most part low and covered with a heavy growth of exceptionally fine spruce timber. The north or Moresby Island shore rises gradually to the Interior Plateau and has an elevation of from 300 to 800 feet. The interior between Cumshewa and Skidegate Inlet is heavily timbered, especially in the river-bottoms and on the shores of Skidegate and Mosquito Lakes. On the north or Moresby Island shore the rocks exposed are sedimentary in origin, consisting of sandstones and shales, with bands of impure limestone. Many interesting fossils are seen on the north shore of Cumshewa Inlet, and especially on Fossil Island.

The greater part of the south or Louise Island shore is granite intrusives and is much steeper, although also covered with a heavy growth of valuable timber.

The minerals so far discovered are contained in some twenty mineral claims on Louise Island, one mile and a half south of the abandoned Indian village of Clew, at an elevation of 1,100 feet. The ore is a high-grade magnetic iron and development consists of test-pits, stripping, etc.; the quality is excellent.

On the north shore, near Lot 172, half a mile from the beach, is a group of Crown-granted claims called the Homestake Group. The ore is gold, silver, lead, zinc. About 2,000 feet of tunnels, crosscuts, etc., have been driven; but the property has not been worked for several years.

Cumshewa Inlet, along with all points on Moresby Island, has weekly steamer connections with Prince Rupert, Victoria, and Vancouver. These steamers call at all the principal logging camps. There is as yet no settlement in the district.

The only land in the vicinity which is at all suitable for any form of agriculture has either been purchased already or is held as timber licences, and will not be available for settlement until the valuable timber is removed.

The nearest pre-emptions are on the shore of Gray Bay, on the east of Moresby Island, about six miles north of the entrance to Cumshewa Inlet. W. Rudge, who resides with his family at Copper Bay, a few miles north of Gray Bay, has several head of cattle, which graze along the shore almost the entire year. Farther north on Sandspit, at the entrance of Skidegate Inlet, are several prosperous farms which supply beef to the logging camps and canneries.

There are no wagon-roads or trails in the vicinity of Cumshewa Inlet, the nearest being a foot-trail between Copper and Gray Bays.

By far the principal industry is the logging of aeroplane spruce, which has attained large proportions during the last year through the fostering of the Imperial Munitions Board. Some eight or ten camps are established on Cumshewa Inlet alone, and the industry should continue to flourish, even though the spruce may not now be needed for war purposes. The spruce is towed to the Northern Mainland sawmills at Prince Rupert, Ocean Falls, and Swanson Bay in Davis rafts. It is there sawed and shipped over the Grand Trunk Pacific to the factories in Toronto and Great Britain. The spruce timber in this inlet is particularly adapted for the manufacture of aeroplanes, and so far 18,000,000 feet of Nos. 1 and 2 aeroplane spruce has been shipped from Cumshewa Inlet alone.

Large quantities of salmon, principally cohoes and humpbacks, are caught each year and canned by the cannery at Abford, in Skidegate Inlet.

Selwyn Inlet.

The head of Selwyn Inlet is connected with Cumshewa Inlet by a narrow neck of water called Louise Narrows, which is only navigable at high water by small boats. The shores of Louise Narrows are for the most part steep and heavily timbered, and several hand-loggers were operating there this summer.

At the head of Selwyn Inlet are two other inlets—namely, Sewell, bearing south-westerly, and Lagoon, north-westerly. These inlets are both heavily timbered and are now being logged. The head of Sewell Inlet is connected to the head of the North Arm of Tasu Harbour by a good trail about three miles and a half long.

About a mile from the head of Lagoon Inlet, Colonel MacMillan, of Vancouver, has built a salmon-cannery, which was completed in time to take a large part of the season's catch.

At Thurston Harbour, on Selwyn Inlet, the Imperial Munitions Board has erected all the apparatus necessary for the formation of Davis rafts, together with a wharf, wireless station, and a storehouse for the convenience of hand-loggers, and a hospital and houses, etc., for the workmen employed. The rafts from this vicinity are towed to the Northern Mainland, there sawed, and shipped to the Eastern aeroplane-factories. So far, 13,000,000 feet of Nos. 1 and 2 spruce, suitable for aeroplane-manufacture, have been logged from this vicinity.

The Imperial Munitions Board had practically completed the erection of three sawmills at Thurston Harbour to take care of the logs cut during the winter, as it is dangerous to attempt to tow rafts to the Mainland during the winter. I understand that these sawmills are now being dismantled, as the necessity for local sawing as a war measure is no longer there.

The climate of these parts of the Queen Charlotte Islands is not as wet as that of the Mainland in the same latitude, and some of the logging camps were threatened with having to close down on account of the lack of water in the latter part of July. There is little or no snowfall, except on the higher ground.

A small variety of black bear is the only game which can be said to be numerous. They frequent the creek-mouths and beach during the salmon run, and one was bold enough to scratch himself on the legs of a transit left out overnight, without upsetting it. There were a few varieties of ducks and some geese in the vicinity during the summer, but they do not come in great numbers until late in the autumn.

ROSCOE INLET.

Roscoe Inlet is connected with Fisher Channel by Johnson Channel, which commences about fifteen miles south-west of Ocean Falls. Johnson Channel is about eleven miles long and one mile wide, and Roscoe Inlet is twenty miles long and about one mile wide. The shores are rough and precipitous, and no trails or roads of any kind are in the area embraced in this report. A few pre-emptions are found near the lower end of Johnson Channel and on Gunboat Passage, but as one goes northward along Johnson Channel the country becomes too rough to be of any use for agriculture.

The shores of both Johnson Channel and the lower portion of Roscoe Inlet are covered by a growth of good cedar, spruce, and hemlock; and several hand-loggers and three logging camps were operating this summer, all the logs being sent to Ocean Falls. The greater part of the timber, is however, better suited for the manufacture of pulp. Some of the larger creek-bottoms contain some very good spruce.

There is very little land here which could be used as pre-emptions outside of those already mentioned, and these are too far from markets, post-office, etc. The post-offices at Bella Bella and Ocean Falls are about equidistant.

There is no mining activity on either Johnson Channel or Roscoe Inlet, and the general appearance of the country does not look inviting from a prospecting standpoint. Roscoe Inlet penetrates into the heart of the Coast Range, where the country-rock is a particularly hard white granite, which rises almost perpendicularly out of the inlet and is very rugged in appearance. There is practically no timber on this part of the inlet, except in the creek-bottoms.

Considerable salmon are caught during the summer at several points on the inlet and taken to the cannery at Namu.

Game in the form of deer and black bear are plentiful, the latter being particularly numerous on the creeks near the head of the inlet; and there are probably some grizzlies, although no tracks were seen. Goat are also found on the steep mountain-sides near the head of the inlet. Grouse, geese, and several kinds of ducks were seen in the summer, and should be much more numerous later on in the fall.

The climate is typical of the Central Coast, being usually pretty wet, although this summer, along with all the rest of the Coast, it was quite dry. The snowfall is very heavy and usually stays until the end of March or beginning of April.

I have, etc.,

A. E. WRIGHT, B.C.L.S.

MISCELLANEOUS SURVEYS, WEST COAST, VANCOUVER ISLAND, AND LOWER MAINLAND COAST.

BY L. S. COKELY.

November 5th, 1918.

J. E. Umbach, Esq.,
Surveyor-General, Victoria, B.C.

SIR,—During the past season I was engaged on miscellaneous surveys on Vancouver Island and on the Coast of the Mainland, the first two months and a half being spent on the west coast of Vancouver Island.

The various districts of the west coast of the island are much the same, there being little arable land in proportion to the entire area. Much of the country is mountainous and very rough and broken, of little value, except for the timber and what minerals may exist. The timber varies in quality, and while large tracts of good fir exist, most of the timber is hemlock, cedar, and spruce. Throughout a very dense undergrowth of salal pervades the timber, and near the shore this is almost impenetrable.

The climate is mild, with little snow near the sea. The rainfall varies from 80 to 120 inches. During the clear summer weather dense fogs drift in from the ocean and leave the timber as wet as a heavy rain would.

The mineral resources are largely unknown, as very little prospecting has been done; the nature of the country and the heavy timber render it slow and expensive to prospect. There would appear to be copper in abundance, and several mines are shipping ore, the largest being the group on the South-east Arm of Quatsino Sound.

The country is sparsely settled, and what settlement there is is near the Coast in the vicinity of the various industries. Owing to the mountainous character of the country there are very few roads or trails, and most of the travel is by water. There are many good inlets and sounds which afford protection from the rigors of the open Pacific, and it is along the shores of these that the canneries and sawmills, which are the chief industries, are located. The Canadian Pacific steamer "Princess Maquinna" makes three trips a month up the Coast, calling at all the ports.

Game is not plentiful; there are very few deer and a few black bear and panther. There are no grizzly bear on the island.

My first camp was near Port Renfrew, on the Strait of Juan de Fuca. We found the country here similar to other parts of the Coast; the timber is rather small, consisting of spruce, cedar, and hemlock, with a dense undergrowth of salal. The surface is broken with many small ridges and ravines, and the soil is very poor, being mostly rock. The nature of the surface and the dense growth of salal made surveying operations very slow and tedious. There were very few settlers in the part in which I was engaged, there being a small settlement at Port Renfrew, where a salmon cannery, opened this year, is the chief industry.

Our next move was to Pachena Bay, just south of Barkley Sound. Here we were on the open Pacific, and we had a very rough trip around Cape Beale from Bamfield in a launch. The water is shallow and the seas break heavily in the bay, which affords no shelter for boats. The country is heavily timbered, with hemlock predominating, and with the ever-present undergrowth of salal. Some good land lies along the shore of the bay, and not far inland is an open muskeg flat of about 150 acres which was taken up and Crown-granted years ago, but no use is being made of it. A little farther west toward Cape Beale is Trout Lake, around which was a small settlement a few years ago, but which is entirely deserted now. The soil here is very poor and the country rough and broken. In the vicinity of Pachena Bay are a few settlers, the majority of whom are Russians, none of them having extensive improvements. Four miles from Pachena Bay and connected by wagon-road is Bamfield, the terminus of the Pacific cable. The Pacific Cable Board has a well-equipped office building employing a large staff. There is quite a village here of the employees and their families. Bamfield is easily accessible, as a launch runs three times a week from Port Alberni, and the C.P.R. steamer calls three times a month.

From Pachena Bay we took a launch across Barkley Sound to Mayne Bay. We found the water too rough and had to camp on an island in the sound until the sea calmed. At Mayne Bay we were very isolated and did not see a soul all the time we were camped there, there being no settlers. Most of the land is held under timber licences and there is little arable land. About five miles from Mayne Bay is Sechart, where a whaling-station is located, but it was not in operation this season.

After completing the work on the west coast I returned to Victoria about the first of September and paid off my party.

My next work was more in the nature of an inspection survey, and I took only one man with me. This arrangement had its advantages and disadvantages, as in our first camp on Jervis Inlet, between Vancouver and Powell River, we were visited during our absence by a drove of beach-combing pigs which just about cleaned us out. As a result we spent several weary hours in building a log fence around our tent. The chief industry here is logging, and much of the country is heavily timbered with fir of good quality. We also noted several good farms that had a look of prosperity.

From Jervis Inlet we moved to Powell Lake. Here we were engaged in making a triangulation survey of parts of the lake and a complete triangulation of Goat Lake. In this work we were seriously hampered by the smoky state of the atmosphere, due, no doubt, to the heavy forest fires that raged in the vicinity during the summer.

The country around the lakes is very mountainous; we measured one peak which came right to the edge of Goat Lake and found it to be 6,000 feet high. There is very little arable land and logging is the principal industry. There are two logging camps on Goat Lake and two sawmills on Powell Lake.

Powell Lake is drained by Powell River, a stream about half a mile long, which was dammed by the Powell River Company to such a height that the water was raised in the lake about 15 feet. When it is considered that the lake is about thirty miles long it will be seen what a vast storage-reservoir the company has. The lake is quite a pleasure resort for the people of Powell River, and many house-boats and launches are to be seen on the water.

The townsite of Powell River is the property of the Paper Company and is well laid out and beautifully kept. The houses are all well painted and the streets are laid out with ornamental shade-trees. The people are prosperous, as the plant pays good wages. The paper-mill itself is a large concern, turning out 250 tons of newsprint a day. It supplies paper to nearly every daily paper on the Coast, including the American cities. They have well-equipped buildings and a very good dock. Naturally most of the working-people are employed in the paper-mill, but there are a few other sawmills and shingle-mills which employ a portion of the residents.

From Powell Lake we went to Denman Island, and were engaged on the subdivision of the reserve on the southern portion of the island. We also surveyed a few small islands near by for the Dominion Government. Denman Island has been settled for many years and the inhabitants are prosperous. There are many good farms and the island is very well suited for raising sheep, as there are no panther present. About half-way up the island is a Government wharf, and a store, post-office, and church are near by. The C.P.R. furnishes a semi-weekly boat service direct from Vancouver and Nanaimo.

The last two months we used an 18-foot boat and an Evinrude engine, which we found to be satisfactory, except the last two weeks, when the weather was too rough to be able to depend on using the boat when needed.

I have, etc.,
LEROY S. COKELY, B.C.L.S.

LANDS FOR RETURNED SOLDIER SETTLEMENT NEAR FORT ST. JAMES, STUART LAKE, RANGE 5, COAST DISTRICT.

BY J. H. GRAY.

January 14th, 1919.

J. E. Umbach, Esq.,
Surveyor-General, Victoria, B.C.

SIR,—I have the honour to submit herewith general report upon the survey operations carried out last season in the Stuart Lake District jointly by D. J. McGugan, B.C.L.S., and myself. The tract subdivided and examined in detail consists in all of 61,359 acres situated upon either side of Stuart River, directly south and east of Fort St. James, at east end of Stuart Lake.

This entire area, on account of location and physical variety has been divided into three groups—viz., A, B, and C—to which reference shall be made.

Group A.—This group comprises forty-six originally surveyed lots or parcels of land, aggregating 22,917 acres, situated on the west or right bank of the Stuart River, directly south of Stuart Lake, having a river-frontage of nearly ten miles, with a general depth, southerly, of five miles.

Group B.—Group B comprises fifty-two original lots, aggregating 28,539 acres, occupying an area some seven miles square, north and east of Fort St. James, at the east end of Stuart Lake.

Group C.—Group C includes fifteen original lots, containing 9,220 acres, lying to the south-east of Fort St. James, in the valley of Necoslie River, which flows north-westerly into Stuart River, where the latter leaves that lake.

GROUP A.

Comparison with other Groups.—Group A (22,917 acres) of the land so far subdivided includes more generally and to a greater extent than the other two groups areas possessing the requisite and attractive conditions inviting to settlement—viz., the best of soil, light clearing,

with a percentage of open land, regular surface, and, with the exceptions noted, good water-supply; moreover, a fairly good wagon-road connection already established with railway communication.

Classification.—The total, 22,917 acres, contained on Group A has been divided as follows:—

	Acres.
First-class land	19,377
Second-class land	2,080
Third-class land	960
Muskeg land	500

The land on the area specified "first-class" consists of a light and dark chocolate-coloured loam, extremely consistent as to grade, irrespective of tree-growth, throughout the whole tract.

First-class Lands, 19,377 Acres.—This soil is very fine in texture, thereby containing capillary moisture to a maximum extent. In August last it was necessary to only kick up an inch or so of soil to find dampness.

It would appear that the soil deepens in colour and possibly becomes more "clayey" upon the Stuart bank, but at no point were found churnings or lumps, resulting from vehicular traffic that might not be easily pulverized in one hand.

This land is entirely free from stones or rock, and excepting the steep sides of the trough of Todd Creek, about 60 feet deep, and a few lateral gullies, there is nothing to prevent, but the standing timber, the whole area from being ploughed.

The overlying leaf-mould or humus varies from 2 inches to ½ inch in depth, dependent upon tree-growth. Poplar creates the greatest thickness, decreasing to but a thin covering where solely evergreen timber prevails. In the same way the natural covering of wild grasses, vetches, and berry-bushes, for the most part luxuriant amongst poplar, diminishes in extent in proportion to the greater or sole evergreen growth, but, as before stated, the excellent character of the land or soil remains unchanged.

Second-class Land, 2,080 Acres.—Under the heading of "Second-class Land" is soil generally a lighter quality of loam, intermixed with a varying percentage of gravel and boulders, the latter on the higher elevations or tops of local ridges. These areas, although cultivable, would not at the present time be sought, nor attract attention, except as possible cattle-runs, whenever the more attractive areas become "fenced in."

This indifferent land is found on the westerly boundary of group, from Lot 1646 south to Lot 1605.

Third-class Land.—The third-class area (960 acres) may be eliminated entirely from any sphere of utility, beyond a possible supply of building-timber. Otherwise this is an area of useless land, occupying practically the whole of Lot 1648 and centre of Lot 1649.

Merchantable timber comprising fir, spruce, and pine is found here; the whole aggregating a supply of some 7,000,000 feet, which, although possibly a useful adjunct to near-by settlement, could not compare with other sources of similar supply, approximate generally to the settlement area.

Muskegs are scattered.—An area of 500 acres of this class of land is to be found in Group A, about 70 per cent. of which is open. Pending more data as to the feasibility and cost of drainage, these have been classed as "lost lands" at the present time.

Unlike other classifications, muskeg is by no means isolated, but occurs at various intervals ranging in extent from 2 to 40 acres. Their position and extent in relation to each quarter-section may be learned from the detail reports.

Clearing, Group A—First-class Land, $21 per Acre (Average Cost).

The following remarks in respect to clearing relates to the area of first-class land only, some 19,377 acres.

An attempt has been made to estimate the cost of preparing the surface for rough-ploughing in the various degrees of tree-growth. This cost ranges from the minimum in open poplar through changing percentages of this timber with spruce and pine and willow, to a maximum in sole evergreen growth.

Useful Timber eliminated.—In the figures of estimated clearing cost of the first-class land area there has been eliminated some groves of "building" spruce and pine, having a diameter of from 12 to 14 inches and aggregating about 500 acres in extent.

This has been done in the belief that the value of such timber is greater than the cost of removal, which removal under ordinary circumstances would be brought about only by degrees, as requisitioned for useful purposes. The enclosure of this class of timber under the head of ordinary clearing, where the material to be removed is valueless except possibly for fencing, would tend to mislead.

Clearing Cost under $21 per Acre.—It has been adjudged that with this elimination the maximum cost of ordinary clearing would not exceed $30 per acre, nor again cost less than $10, and hence is estimated the following:—

1,000	acres	costing	$30 00
6,641	acres	costing	25 00
6,368	acres	costing	20 00
4,151	acres	costing	15 00
717	acres	costing	10 00
18,887	acres	averaging	$20 81 per ac.

Relating to the above figures, I beg to repeat here what was written in my sub-report of August 18th last:—

"Before concluding, a word on the subject of clearing cost. In body of report are quoted figures of cost in relation to various localities.

"I recognize the risk in stating a price, especially in the absence of any practical experience. It might be explained, however, that what has been quoted is an endeavour to obtain an average rate over the whole parcel dealt with, unless otherwise specified. This would greatly vary in accordance with the manner in which the work was executed. I have tried to base my estimate of cost upon operations as usually followed by the ordinary settler—viz., of cleaning up the open and easier patches of land at his disposal and permit time to work upon his heavier woods (supposedly already slashed or killed).

"Should it be determined to clean up, say 50 square acres forthwith, the cost would certainly exceed my figures. Again, if 'straight-ahead' clearing were to be organized and prosecuted upon a community and large scale, I am of the opinion that they would be largely reduced."

There shall be found many quarter-sections in which, by following the stretches of more or less expansive open land or light tree-growth, it would be possible to clean up acreage under the minimum cost stated, and in many cases practically without.

Natural Water-supply.

Owing to the low altitude of the flanking ridge on the south (the watershed between this and the Nechako Valley), streams are infrequent, the water-supply here being confined practically to Todd Creek, which, after receiving Rabbit Creek, its principal feeder, some two miles within the tract, flows northerly, parallel to the Stuart River, *but in the opposite direction*, in a trough some 60 feet deep.

Numerous small lakes or ponds are scattered about; these, however, could not be counted upon to contribute potable water-supply during the summer months.

The Stuart River bounds the tract on the east, providing a bountiful water-supply of excellent quality (although not always convenient) to the areas adjacent.

Percentage of Dry Quarter-sections.

The distribution of the natural water-supply, as is usually the case, is inadequate to meet the general demands of the entire settlement area.

The first-class land as at present subdivided is composed of quarter-sections or parcels of land to the number of 128. Of this number, seventy-two are without a natural supply of good water, or about 56 per cent., while on fifty-six subdivisions, or 44 per cent., a good water-supply was found.

Wells.

What difficulties may be encountered in the sinking of wells is not known, since, owing to the absence of any settlement on this the west side of Stuart River, no undertaking of this description has been attempted. On the east or Fort St. James side wells have been sunk and water found at varying depths, from 20 to 40 feet.

An amelioration of this situation could, of course, be effected by varying the subdivision so as to distribute the existing supply to the greatest extent possible, since where found, principally Stuart River and Todd Creek, this essential is good and abundant. The lakes and ponds referred to would answer for stock.

Transportation, Group A—30 Miles from Railway.

The Government wagon-road from the Grand Trunk Pacific Railway at Vanderhoof to Fort St. James traverses the length of Group A, being practically twenty-five and thirty-five miles respectively from the former place and railway at its south and northerly boundaries. This road is used by automobiles in the summer and is a fairly good means of communication, subject to the usual disabilities attending country roads during change in seasons. Connection with the railway could be much reduced and still pass through a good line of country at its southerly end.

The crossing of the Stuart River to Fort St. James is at the present time by cable-ferry. A bridge just below the present ferry-site would be a simple affair.

Settlement should be inaugurated in Group A.

Group A, just described, constitutes the most favourable field in which to start settlement. The place within it at which a community point or headquarters should be established is on the present wagon-road at the point on west boundary of Lot 1551, where a bend in Todd Creek crosses and recrosses that line. This combines good water-supply with established line of communication, besides being approximate to several sleigh-roads and trails which traverse this tract in various directions. It is central and some of the most attractive subdivisions in the group surround it.

Cattle and Winter Feed.—Since a small herd of cattle shall be an essential adjunct to the settlers' undertaking, the question of available winter feed, in the beginning at least, is of first importance. Wild hay meadows of any extent in Group A are held under Indian reserve, excepting that in Lot 1656, which lot is already Crown-granted.

The lack of hay meadows here could be effectually met by utilizing temporarily, upon a community basis, the areas of this description in Group B; also the acquisition of Lots 1654 and 1656 may be considered advisable on general grounds.

Lumber—Local Price $35 per 1,000 Feet B.M.

Mill now operating.—A small mill is now established on the north shore of Stuart Lake, about six miles from Fort St. James. This turns out much more material than present needs require, and possibly there may be found cured lumber in stock. The present rate is $35 per 1,000 feet B.M.

Mill-site.—Should it be determined to augment this institution, there is a convenient and reverted Timber Limit 638P, Lot 4932, three miles from river-mouth on north shore of Stuart Lake, which would be available for a mill-site if water and a sheltered nook exists in which to place the plant. This shelter is requisite since this shore of the lake is exposed and shallow.

Stuart Lake Main Timber-supply.

Access to Stuart Lake.—The main timber-supply for not only Group A, but the entire settlement area as proposed, shall come from Stuart Lake, and there is no finer timber in the north than found on its shores. It would therefore seem desirable that access to the lake from within Group A should be secured.

Mouth of Stuart River Best Shelter.—Attention is directed to the alienated area lying to the north and east of Lot 1665, whereby this access would be effected, and what perhaps is of more importance, control over the sheltered waters within the mouth of Stuart River. This question, however, requires more research and expert decision.

Group B, 28,539 Acres.

This group occupies a shallow valley stretching north-easterly from the south end of Stuart Lake for a long distance.

General Description.—The area subdivided includes not only all the good land which lies in a strip some eight miles in length, averaging three miles wide, but extends north and south from this strip up the slopes of the flanking ridges in second- and third-class areas.

Tree-growth.—Evergreen growth in spruce and pine is in greater percentage and heavier than in the lands hitherto described, resulting in greater clearing cost. Open or hay meadows are found to a greater extent, as are also *drainable* muskegs. The general altitude is also greater than in Group A.

Group B suitable for Stock-raising.—In a general way Group B is better adapted for stock-raising than any other of the lands reserved, and beyond the few choice locations in the neighbourhood of Stuart Lake it is likely to be sought for this purpose, combined with a minimum of mixed farming. The whole district lends itself to the production of fine stock, in which, besides the luxuriant natural feed, the presence of a maximum of lime in the water may have something to do.

It is a good horse country, in many instances these run out all winter, but this is not advantageous treatment. A safe estimate would be three and a half months feed for horses and five months for horned stock.

The limited experience so far as practised seems to demonstrate the breeding of local animals with imported bulls to be more successful than the importation of unacclimated beasts —the same with horses.

Classification.—The 28,539 acres contained in Group B have been divided as follows:—

	Acres.
First-class land	13,465
Second-class land	11,752
Third-class land	1,940
Muskeg land	1,382

First-class Land, 13,465 Acres.—The first-class or really good areas of Group B are composed of the same chocolate-coloured silt met with in Group A. There is by no means, however, the same depth of this soil, nor its widespread and consistent excellence. These remarks would not occur only in comparison with such an exceptionally good tract of land as is found in Group A.

In the matter of open land or hay meadows and water-distribution it is better served than either of the other two groups, while the eight sections nearest to Fort St. James offer to immediate settlement inducements quite as attractive.

Hay Meadows.—In the acreage stated for first-class land is included 400 acres of what may be termed wild hay meadow, from a proportion of which hay is now being taken.

It is to this area reference was made in speaking of "winter feed" for settlers in Group A. Where it occurs the covering growth is willow, the removal of which is not costly, so that preparation for even only the wild grasses and their (meadow's) enlargement would guarantee the economical wintering of so much more stock.

Second-class Land, 11,752 Acres.—Second-class land, 11,752 acres, of same character as already described, occurs as the slopes of the adjacent ridges lying north and south are ascended. Owing to the large percentage of evergreen growth, summer feed in places is scant, but at least one-half of this area would be excellent cattle-run.

Third-class Land, 1,940 Acres.—Third-class land, 1,940 acres. This area consists for the most part of rocky tops of the flanking hills, and beyond the (in many cases) good growth of milling-timber are of no value.

Muskeg, 1,382 Acres.—This area is practically contained in one locality, known as the "Grand Muskeg," occupying portions of Lots 4752-4751 and 4725, on the imperceptible height of land between the waters flowing westerly into the east end of Stuart Lake and those into Ocock River on the east, the waters of which, after first flowing into Pinchi Lake, also reach Stuart Lake farther to the north and west. This muskeg is considered "drainable" at reasonable cost, but estimating this cost would require such examination as has not been given.

Lime.—It might here be remarked that, relative to the reclamation and "sweetening" of any such land, the district abounds in limestone, from which an excellent article of lime has been produced, and should be economically procurable.

CLEARING, GROUP B—FIRST-CLASS LAND, $25 PER ACRE.

The clearing cost relates only to the area included under head of first-class lands—viz., 13,465 acres. This has been determined at the average rate of $25 per acre.

Areas near Fort St. James.—The area referred to as "nearest Fort St. James offering inducement to immediate settlement" might be placed somewhat lower, since quite open land is to be found at intervals.

Clearing Second-class Land.—Clearing second-class land is placed at $30 to $35 per acre, and would include a large percentage of good building spruce and pine.

Natural Water-supply, Group B.

A glance at the map indicates that many small streams, all providing a perennial supply of excellent water, flow down from the northerly ridge and meander through the length of the better lands.

Subdivision.—The first-class area, 13,465 acres, consists of eighty-seven quarter-sections or parcels of land.

Percentage of Wet and Dry Parcels.—Of these, fifty-one, or practically 60 per cent., have access to a natural water-supply, while thirty-six or 40 per cent., are without water.

Lakes.—The two lakes that occur in Group B both contain good water.

Wells.—No wells have been sunk in this locality; it is, however, thought that no difficulty will be found in getting water at reasonable depth.

Transportation—Principally Hay-roads.

As stated, a Government wagon-road connects Fort St. James with the Grand Trunk Pacific Railway at Vanderhoof, a distance of about thirty-eight miles. This same road extends another mile to the Roman Catholic Mission on Stuart Lake. From the "Mission" the Manson Creek (Government) Road is roughly constructed and runs northerly to the northern boundary of tract.

Another road (the old McLeod Lake Trail) starts at Fort St. James and traverses the southerly tier of good sections to the east boundary, and a branch road from this crosses north-easterly and traverses easterly to the same boundary the northerly tier of good lands, so that Group B is already fairly well equipped with lines of communication, such as they are.

These roads have been constructed partly by settlers and to a large degree by the Indians, their principal use being for haying operations (teams and wagons) in the late summer and hauling of hay from the stacks in the winter months, for both of which duties they answer fairly well; during change in seasons, however, they are impassable for wagons.

Group C, 9,220 Acres.

That portion of Group C which was subdivided this season consists of a small portion at its north end of the reserved area lying in the valley of Necoslie Creek, and which may be said to be the inferior portion of this large and excellent tract of land. This inferiority relates particularly to those parcels lying on the southern slopes of the dividing ridge between this and Group B and to the north of the strip of pre-empted lands. It is in this locality that the second-class land noted below occurs. To the south of the pre-empted areas are excellent lands, quite ready for immediate *further* settlement.

A report will follow, made upon the subject of pre-emption improvements in this locality, in which it will be shown that these have been carried on to a considerable extent.

Classification.—Group C has been divided into two classes only, first- and second-class lands, viz.:—

	Acres.
First-class land	7,140
Second-class land	2,680

First-class Land.—The first-class land is of same composition as in Group A, and similar conditions as to depth and consistent grade prevail; generally speaking, however, the clearing is somewhat heavier.

Necoslie Water-flow.—The Necoslie River is a stream of dimension in flood, being from 75 to 100 feet wide and probably reaching a depth of 3 feet, which conditions are changed, however, in autumn to a small run of water forming pools between shallow ripples; abundant water, however, for all needs.

Necoslie Trough.—The stream itself is tortuous, winding across the intervening flats from foot to foot. These flats are open to a large extent, or except where covered with a light growth of poplar and willow. These locations offer opportunities for a small start with little preparation.

The foregoing remarks relate to the first ten miles of the stream, practically to the point where it traverses the north-east corner of the "allotted areas," beyond or to the south of which, through the reserved lands, the river flows closer to the surface of the adjacent ground.

Second-class Land, 2,680 Acres.—As stated, the second-class land, 2,680 acres, occupies almost entirely the northerly end of Group C, and not more than 60 per cent. of this area could be counted of much use for grazing purposes. The fine growth of timber found here, however, will be valuable.

Meadows and Muskegs.—The extent of this class of lands is negligible; that is to say, no extent of either is found in one place.

Clearing, Group C—First-class Land, $24 per Acre.

The tree-growth over Group C may be termed patchy, in so far that, although the mixed timber—poplar, spruce, and pine—prevails, all three are found in distinctly separate and unified groves, but, as in Group A, without change in the supporting soil. The cost of clearing the first-class land, 7,140 acres, has been estimated at $24 per acre, and this rate may be considered on the high side.

Natural Water-supply, Group C.

Outside the Necoslie itself the water-supply is poor. Group C as subdivided consists of forty-five subdivisions, of which twenty-seven, or 60 per cent., are supplied with water, while on eighteen, or 40 per cent., no water was found.

Transportation, Group C—Poor.

An ill-made or simply "swamped-out" road over which teams may be taken in summer extends through the length of the pre-empted lands as shown. This road starts at Fort St. James and dwindles into a trail ten miles out.

Climate.

Judging from the experience of people who have lived in this locality, the climate is healthful and invigorating. The summers are not excessively hot and showers are frequent up to the middle of August; the autumn is usually dry. Extreme winters last five months; sometimes only four, November to March. Low thermometer is never accompanied with wind. Blizzards, as also floods and droughts, are unknown.

Very cold snaps (—30° to —40°) occur each winter; these vary, but are usually of short duration, or three days. The average winter thermometer is around zero.

Precipitation.—The Dominion Meteorological Department has a station at Fort St. James under the direction of Mr. O. W. Murrey. From this source the average rain and snow fall for the past twenty years has been determined as 15.35 water-inches per annum.

Elevation—Stuart Lake, 2,200 Feet above Sea.

The elevations relative to each other and to Stuart Lake were determined throughout the three groups. Obtaining this information was incorporated with other survey-work, so that contours could be available for a topographical plan. These results have not yet been deduced, but it may be stated that, taking Stuart Lake to be 2,200 feet above the sea-level, the first-class land will be found to lie approximately as follows:—

Group A	2,200 to 2,430 feet above sea-level.
Group B.	2,250 to 2,500 feet above sea-level.
Group C	2,175 to 2,300 feet above sea-level.

Work of Survey.

It is not proposed to more than touch upon this subject at the present time, since the data obtained has not been fully made up, but to delay that report until such time as full returns shall have been completed.

Employees.—Two surveying parties were engaged; two surveyors and one assistant with eight returned soldiers and a cook left from Victoria in July last. This force was augmented on the ground, as the purposes of the work demanded, by engaging Indians and later another returned man.

Standard of Old Surveying-work.—The standard of the previous surveying applied to the original sectional subdivision was found to be excellent. The limit of error established for the subdivision survey having in no case been approached—in fact, excepting in the case of a few intersections, the joining error or difference, both in the cross-chaining and distance off old post, was negligible. The markings on old posts were scrutinized. In one case only was a correction made.

A detail report upon this and other matters pertaining to and resulting from the conduct of the work will be submitted.

SOIL SAMPLES.

Some twenty-four samples of soil were obtained from different points over the three groups. These samples were boxed to be forwarded the week after my departure from Fort St. James, but this has not been done. Word was received some ten days ago that they had been traced and were on their way. These with diagrams will be submitted whenever received.

TOTAL LANDS RESERVED, ONE-HALF SUBDIVIDED.

Area of Reserved Lands not subdivided.—The area subdivided is about one-half that covered by the instructions, which governed the work last season. The remaining area contains all the lands on east side of Stuart River, back to and across the Necoslie River, practically to its head. Speaking from a knowledge of this tract, it may be said it will be found to compare favourably, for the most part, with Group A.

In this connection it might be remarked at the present time that in the matter of transportation it should not be overlooked that the Stuart River offers an excellent and alternative line of communication direct with the Grand Trunk Pacific Railway, not only passing through these unsubdivided areas to the south-east, but as a probably more economical means of handling freight in the summer months to Groups A, B, and C.

Distance by Stuart River to G.T.P. Rly.—The distance by river from the present Stuart River ferry to the railway is sixty-seven miles, forty-two of which is good water. The lower river is swift, one rapid, and has been improved for navigation by the Dominion Government. There is no impediment that boats up to 25 tons, properly equipped, could not successfully and regularly negotiate during six months in the year.

Cross-road from Lot 2785 to Railway.—An excellent "cross-country" line for wagon-road connection with the railway (G.T.P.) exists from a point on west bank of Stuart River in Lots 2785 or 2786. Such a road would reach the railway at Vanderhoof in thirteen or fourteen miles, and strike the lower reserved lands at a half-way point on Stuart River, with an excellent slow-flowing stream on either side (up and down river), besides tapping to the east a natural ascending grade to the back lands.

EXPERT REPORT ON STUART RIVER VALLEY.

The following synopsis, in part, of a report based upon screenings and analyses of soil samples, made a few years ago by a land expert, Mr. Woods, as emphasizing the merits of this tract of country as a favourable field for settlement, may be interesting. He says in his report:—

"*Area.*—102,000 acres.

"*Location.*—In Central British Columbia, near the Grand Trunk Pacific Railway, at the foot of Stuart Lake and along the Stuart River for about forty miles.

"*Stuart Lake Basin.*—An old glacial lake, probably 200 miles long, with numerous arms and variable width—probably 100 to 200 feet deeper than the present lake and containing numerous islands which are now hills.

"*Now partly drained* down to the present lake, the 'pot-holes' of the old glacial lake.

"*The Silt Area.*—All the space between the present lake-rim and the old basin-rim.

"*The Lake-bed Soils.*—The humus: 1 to 3 inches of black vegetable mould.

"The 'white silt': 1 to 3 inches of volcanic dust.

"The 'chocolate loam': 4 to 12 feet of volcanic dust, formed as lake sediment in successive layers from 2 to 12 inches thick, with marine grass-roots and a large content of organic matter in each layer.

"The 'deep silt': A great deposit of fine volcanic dust underlying the chocolate loam to an unknown depth, but observed in the cut-banks of the river to a depth of 60 and 80 feet.

"'The finer the richer': The rule for all soils. (Fletcher on 'Soils,' page 25.)

"Silt and clay particles: These constitute the richness and durability of all soils.

"*Percentages of Silt and Clay in Different Soils.*—(8,671 samples analysed by United States Department of Agriculture from United States soils.) Of the many given, three highest are quoted:—

	Per Cent.
Clay soils	78
Silt loams	80
Silty clay loams	86

"*Stuart Lake Soils analysed—*

Stuart Lake and River 'white silt'	86.3
Stuart Lake and River 'chocolate loam'	86.8

"They are easy to work, are mellow when ploughed, and can be ploughed at any time.

"*Organic Matter in Various Soils.*—Of the many percentages given in Mr. Woods's report, a few of the higher and the highest are quoted here:—

	Per Cent.
Average soils, the average of many	2.30
North-eastern States (highest for average soils)	3.73
Average for rich silt soils	5.30
Yasoo bottom silt (Miss.)	7.37
Putah Valley dark loam (Cal.)	7.12
Arroyo Grande Valley dark loam (Cal.)	6.23

"The Yasoo bottom and the Arroyo Grande soils, mentioned above, are considered to be among the 'richest known soils.'

"*Organic Matter in Stuart Lake and River Soils—*

	Per Cent.
Stuart Lake and River 'white silt'	6.59
Stuart Lake and River 'chocolate loam'	6.72

"NOTE.—All of the above samples for organic matter undoubtedly include a portion of the top humus soil, except the samples of the Stuart Lake and River soils, which do not include any of the humus."

Speaking at length in respect to plant-foods and nitrogen especially, the report sums up:—

"With a top humus and over 6 per cent. of organic matter in its main soil and subsoil bodies, the Stuart Lake and River sediments are sure of surplus nitrogen-supply for an indefinite period."

On the question of moisture Mr. Woods has to say:—

"When at any time the amount of rainfall entering a soil becomes greater than the water-holding capacity of the soil, losses by percolation will result. The bad effects of excessive percolation are twofold: (1) The actual loss of water; and (2) the leaching-out of salts that may function as plant-food. The quantity of nutrient elements lost annually from the average soil in a humid region more than equals that withdrawn by the crops.

"*Unsurpassed Qualities of the Stuart Lake and River Sediment Soils.*—First: The finest texture couples with easy tillage.

"Second: A large excess in mineral plant-foods, as shown by all the analyses of silt soils.

"Third: An organic content in excess of the richest silt soils and far in excess of average soils. No other soils known to the writer or mentioned in the many soil authorities consulted so fully combines *richness, durability, and mellowness for easy working* and for the *conservation of moisture.*

"This could only occur, as in this case, where a wind-carried volcanic dust has been deposited in water and remained undisturbed under water until it accumulated a large organic content. Water-carried soils (alluvial soils) cannot preserve all of these qualities.

"In a word, these lake-bed sediments take the highest rank for fineness and durability, for ease of working, and for range of crop and capacity.

"*Conservation of Moisture and Soil Strength.*—The smallness of the rainfall at Stuart Lake and River (15.35 inches) is more apparent than real. The snow melts in March and April, about 13 inches enter the ground from March 1st to September 1st, during the period of growth and maturity, *and it is all utilized.* There is practically no 'run-off' and no sinking beyond the reach

of crops. The soil is porous enough to let it soak in, but fine enough to hold it by capillary force, without its sinking away as in sandy soils. Further, there is no leaching or flooding away of plant-food elements. Heavy rainfall hinders agriculture and wears out the soil by washing out its values.

"'Enough but not much' describes the Stuart Lake and River precipitation.

"In 'Soils,' by Lyon Fippin & Buckman, page 271, it is stated that of a 28-inch rainfall, one-half runs off, one-fourth evaporates, and one-fourth is used by the crop.

"*Clearing Land.*—Timber of fence-pole size; slashing and burning (by hand), $5 to $12 per acre; grubbing, $5 to $10 per acre. Eighty per cent. of the land could be cleared, grubbed, and ploughed in a single operation by a simple machine of proper size at less than $5 per acre."

I have, etc.,

J. H. Gray, M.E.I.C., B.C.L.S.

PHOTO-TOPOGRAPHICAL SURVEY, OKANAGAN VALLEY, SIMILKAMEEN DISTRICT.

By R. D. McCaw.

November 29th, 1918.

J. E. Umbach, Esq.,
Surveyor-General, Victoria, B.C.

Sir,—In accordance with your instructions, the photo-topographical survey of the Okanagan Valley has been extended southerly on the east side of the Okanagan River from Penticton to the International Boundary, and I submit the following report upon the field operations carried on in this connection during the past season:—

The instruments used were practically the same as those used in 1917, the two cameras and one small transit having been loaned again by J. J. McArthur, Boundary Commissioner of the Dominion Astronomical Observatory, Ottawa. Cramer's slow isochromatic plates were used in photography, some 35 dozen being necessary to cover the area. For triangulation the same instrument of previous years was used, with circle graduations reading to 20 inches. The triangulation was carried south to the International Boundary from stations of previous years, six new primary stations being used, two of which have been located by the Geological Survey of Canada. As a large area was to be covered in a short season, the triangulation-work lacks some readings which I desired to have from 1914 stations, but time would not permit of occupation of these. However, sufficient readings were taken to give complete connection between the various triangles. Connections were made in several instances to monuments on land-survey lines.

Actual field-work extended over a period of a little more than two months, photographic work and triangulations being run simultaneously as in previous years. Two camera parties operated every day that it was possible.

Season's Operations.

My assistant, T. Rognass, left here on August 8th, collected the camp outfit at Vernon, and made some of the preliminary arrangements at Penticton. He also commenced the erection of signals for future instrumental stations on the west side of the Okanagan River Valley. I joined him on August 15th and completed arrangements for the season. Signals were then erected to continue the triangulation to the International Boundary. The new primary stations consist of two Geological Survey stations—one south of Ellis Creek, the other on Apex Mountain south of Keremeos Creek; also Mount Kobau, Baldy Mountain, Incameep Reserve, and Osoyoos Lake (for boundary tie). Signals were still standing on the Geological Survey stations, so no preliminary trips to these were necessary. The other stations are new and trips were made to Baldy Mountain and Mount Kobau for the purpose of erecting signals before leaving Penticton. Baldy Mountain, on the east watershed and some eleven miles north of the International Boundary, was not difficult to reach, but the distance was considerable, the return trip covering ninety miles. Mount Kobau, on the west watershed, was reached from the main road along the river after a climb of about 5,000 feet. In order to facilitate this preliminary work, a motor-car was made use of

for transportation and thus delays from moving camp were eliminated. In addition to the erection of signals, several camera stations were occupied in close proximity to the Okanagan River.

On August 22nd a camp was located at the Penticton Municipal Reservoir on the South Branch of Ellis Creek. This reservoir is about sixteen miles from Penticton by wagon-road and pack-trail. The Carmi Wagon-road extends easterly from Penticton for a distance of about ten miles, the grade ending at the North Fork of Ellis Creek. A good pack-trail continues easterly towards Carmi, while a branch trail leaving this leads to the reservoir and eventually to Shuttleworth Creek. Penticton has two reservoirs in this locality, a small storage-site lying to the west of the main reservoir. The small reservoir has a very small watershed. Generally the character of the country in the locality is broken and a good number of camera stations were required. While at this camp the Geological Survey station south of Ellis Creek was occupied. The position of this is on a timbered ridge and a great deal of clearing was necessary before sights to other stations could be taken. The timber-growth in this vicinity is usually jack-pine, with spruce and balsam in the higher elevations. The entire area south of the upper part of Ellis Creek and extending to the Shuttleworth Creek Divide has been the scene of fires in years gone by. Much of the country is covered with a tangle of windfalls, which on steep slopes makes travelling hazardous. Intermingled with this is a growth of small jack-pine and spruce. That portion in the vicinity of the east boundary of Lot 2710 between Miles 16 and 20 is the worst area of windfalls I have found in the Okanagan Valley. A great deal of standing dry timber exists over the area as well.

Shuttleworth Creek was the next base of operations. This stream is fed mainly by swampy meadows, with a few small lakes. The North Fork is a small stream flowing from a lake in Sub-lot 16. A dam has been built to create a storage-site here, but the intended reservoir has not been filled. The upper part of the main stream flows through a gently falling valley with non-precipitous sides. The lower part of the creek flows through a deep canyon until the benches of the Okanagan River Valley are reached. The junction with the last-named stream occurs about half a mile south of Dog Lake. The Ellis Creek pack-trail extends towards Shuttleworth Creek, and thence easterly and northerly to the reservoir-site meantioned as being on Sub-lot 16. A poor trail extends westerly along the north side of the creek to the wagon-road at Shuttleworth's ranch. The north slope of the upper part of the creek is almost devoid of windfalls, the growth consisting of open jack-pine usually. The south slope is generally covered with a small growth, with windfalls, running into spruce and balsam, to the east. A very good pack-trail was found paralleling the east boundary of Lot 3639 and a little to the west of this limit. I believe it extends from Wilkinson Creek to McIntyre Creek (Sawmill Creek).

From a camp near the mouth of Shuttleworth Creek stations were occupied east and west of the Okanagan River and in the vicinity of McLean Creek. This latter stream is but a small one heading between Ellis and Shuttleworth Creeks, the outlet into Dog Lake being almost opposite Kaleden. Smoke from forest fires gave a poor atmospheric condition at this period and distance was difficult to photograph. The main valley from Dog Lake south is much broken by small isolated hills separated by narrow and sometimes fairly wide valleys. As a rule these hills have one or more precipitous sides, and near the mouth of McIntyre Creek this particular feature seems to reach the climax. McIntyre Bluff, west of the Okanagan River, is a well-known feature. It drops sheer for about 500 feet, with rock-slides at the river's edge.

McIntyre Creek (Sawmill Creek) is the largest tributary to the Okanagan River south of Dog Lake. The drainage area is large, five branches contributing a large volume of water to the main stream in the spring and early summer. The main stream for six miles back has a rapid fall over a bed of clean-washed boulders. At about two miles back a perpendicular canyon is entered, the sides being between 200 and 300 feet high. The tendency of all slopes on the lower part of the creek is to be very steep, and mud-slides are not uncommon along the bottom. The system is fed by meadows and small lakes, the greater part of the water coming from a mountain-mass to the north-east and from Baldy Mountain. The upper watershed is generally well timbered with the usual jack-pine, spruce, and balsam. In lower elevations southern exposures show some grassy slopes, and the north slope of the lower portion is an extremely steep grass slope, so steep that stock does not take readily to it, although a luxuriant growth of bunch-grass covers it. A forest fire in 1917 damaged a large portion of the timber-growth on the lower six miles. Owing to the steep slopes there is no good trail on the lower part of McIntyre Creek. A fair trail

extends from Shuttleworth Creek across the North Fork of McIntyre Creek, and then follows the north side of the main stream easterly towards the Kettle River. A trail from Incameep Creek joins this near the North Fork of McIntyre Creek.

From a main camp at the Fairview Bridge the balance of the south end of the work was completed. A week of fine clear weather from September 21st enabled us to do numerous stations along the main valley in the vicinity of Incameep Indian Reservation and Fairview. A primary station (Mount Kobau) was occupied during this week. From this mountain a splendid view was obtained in all directions and many signals read. Rain set in about the 28th, and from that date until we finished wet weather hindered us a great deal. In addition, the atmosphere became very smoky again, and this condition continued for over a week. A fly camp was taken up the Camp McKinney Road for the purpose of occupying Baldy Mountain as a primary station. Rain and smoke made the occupation of this station tedious and we were delayed some three or four days. The right-of-way of the West Kootenay Power and Light Company passes over the south end of the Baldy Mountain Ridge and about four or five miles south of the summit. Active clearing operations were going on in this locality, the right-of-way having been already cleared from the Kettle River to the Kettle Valley-Okanagan Divide.

Incameep Creek and Wolf Creek form the source of water-supply for irrigation in the Incameep Indian Reservation. The former is the larger and has its source on the east watershed. The drainage area which embraces part of Baldy Mountain is well timbered, tamarack being much in evidence. The old freight-road leading from the main valley to Camp McKinney ascends through the Incameep Basin and connects with the Kettle River Valley. The West Kootenay Power and Light Company is improving the grade of this road and widening the clearing. At the lower end near Okanagan River a portion of the old road is almost impassable on account of sand-hills. To overcome this obstacle a deviation was made and a good grade is being constructed.

On October 9th the primary triangulation was extended to the International Boundary and connection made to Post 117. Two camera stations were occupied west of Osoyoos Lake to complete photographic work in this locality. Camp was then moved to Penticton and several triangulation and camera stations completed in that vicinity. The party was paid off on the 14th, with the exception of one man whom I retained to accompany me to Apex Mountain and up Ellis Creek to make a tie to the east boundary of Lot 2710. Apex Mountain (about 7,300 feet in elevation), as I mentioned previously, is a primary triangulation station south of Keremeos Creek. Readings were taken from this station to all primary signals visible. A branch road running southerly from the old freight-road along Keremeos Creek took us to an old mining property near the top of the mountain. The balance of the trip was over open slopes. Three days were occupied in the trip to Apex Mountain and return to Penticton. Bad weather with snow followed us up Ellis Creek, and the existing windfall conditions on steep slopes made it impossible to get the connection desired. However, a tie was made to Sub-lot 4, which had been connected with Mile-post 18 on the east boundary of Lot 2710. This concluded the field-work, and according to your instructions the camp outfit was stored at Penticton.

For transport, pack-horses were hired for the season, while a motor car or truck was hired when necessary along the main road. The following gives the number of stations occupied:—

Primary triangulation stations	5
Secondary triangulation stations	4
Photographic stations	54
Separate camera stations	104

General.

The past season was rather exceptional for the Okanagan Valley, in that there was a great deal of rain during July and August. The early part of the summer was dry and the atmosphere was clouded with smoke from forest fires. The rains following cleared up this condition and the growth became green and luxuriant down to the bottom of the valley. This in the middle of August is not the rule for wild growth in the Dry Belt. Another hot, dry period followed from about August 20th to the end of September and the grass was soon dried up again. Forest fires became numerous, causing smoky atmospheric conditions, very detrimental to good photographic work. The fall rains commenced the last week in September and wet weather followed us to the completion of the work.

The area covered this year is more or less a grazing country and the lower hills seem to be well stocked. Small areas of orchard lands are seen around Dog Lake, but from Vaseaux Lake south very little cultivation is done other than a few hay-fields. A large area of the present sage and grease-wood covered country could be brought under cultivation with an efficient irrigation system.

Very little game was seen, although there seems to be plenty of deer. Sheep may be seen between Ellis and McLean Creeks. Bears seem to keep away back and are almost altogether black, although the Indians say there are some grizzlies near Baldy Mountain. Grouse were plentiful. It would hardly be fair to leave out the rattlesnake. These reptiles are very numerous in the lower elevation; fifteen were killed by members of the party during the season.

Map-work is now being proceeded with, the area covered being about 350 square miles. As a direct tie now exists between the Armstrong Astronomical Station and the International Boundary, the geographic positions may now be revised and the triangulations corrected for the first time. The final photographic work is all being done here this year in the new dark room of the Survey Branch. This includes photographic enlargements from the negatives, which previously have been made in Ottawa.

I have, etc.,

R. D. McCAW, B.C.L.S.

SURVEY OF THE BOUNDARY BETWEEN THE PROVINCES OF ALBERTA AND BRITISH COLUMBIA.

BY ARTHUR O. WHEELER.

December 30th, 1918.

J. E. Umbach, Esq.,
Surveyor-General, Victoria, B.C.

SIR,—During the season of 1918 the survey of the Interprovincial Boundary was carried on by the two divisions heretofore engaged upon the work—viz., that of R. W. Cautley, D.L.S., Commissioner for the Dominion and for Alberta, having in charge the survey of the watershed across the passes of the main divide of the Rocky Mountains and the construction of monuments to mark the same, and that of A. O. Wheeler, B.C.L.S., Commissioner for British Columbia, in charge of the photo-topographical delineation of the watershed between the passes and the mapping of the country adjacent thereto.

INSTRUCTIONS.

It was found necessary for the time being to detach Mr. Cautley's division from the survey of the passes and apply it to the survey of a portion of the 120th meridian in the vicinity of Swan Lake, in the Peace River District, where the said meridian was the dividing line between the two Provinces, owing to the fact that considerable settlement had taken place in that portion of the district.

The topographical division was instructed to continue the survey of the watershed northerly from the point in the vicinity of Howse Pass where it had been discontinued the previous season.

SURVEY OPERATIONS.

Acting under instructions from the Surveyor-General of Dominion Lands, Mr. Cautley proceeded with his party to Pouce Coupe, where the exact longitude had been established by Mr. McDiarmid, D.L.S., the previous year.

In accordance with his instructions, Mr. Cautley established a concrete monument at the nearest suitable point to the intersection of his connecting line with the 120th meridian, said point being 3.334 chains north of the said intersection, and then ran the boundary south. By the end of the season he had succeeded in establishing a little over eighteen miles of the boundary, the last monument erected being No. 74-8, which is a few chains south of the north boundary of Township 74 and about one mile and a half south of the Grande Prairie and Fort St. John Wagon-road and the Government Telegraph Line.

Owing to failure on the part of the contractors for the brass plates required to mark the monuments either to manufacture and forward the plates as agreed or to inform the Department

that they had not done so, he had no plates available for the work until the 16th September and was unable to build any monuments until after that date. Twenty-one concrete monuments were built in all during the season. In accordance with the decision of the Commission the monuments were marked with the number of the township of the Dominion lands system in which they occur, followed by the number of the particular monument in order from the south boundary of the township. Thus the first monument built north of the south boundary of Township 77 is marked 77-1, and so on.

Surveys were made to connect the survey of the boundary with the north boundaries of Townships 75, 76, and 77 respectively, and the strip of land between the boundary as established by Mr. Cautley and the one formerly surveyed to the west of it was found to be 18.304 chains on the north boundary of Township 76 and 18.227 chains on the north boundary of Township 75. Under instructions, Mr. Cautley ran levels and check-levels from B.M. 9, being 180 feet east and 10 feet south of the north-east corner of Section 36, Township 76, Range 14, to the intersection of the boundary with the north boundary of Township 76, from which point he ran levels and check-levels to monument 78-1 at the northerly extremity of the completed line, and afterwards from the same point he ran a single line of levels south to monument 75-1, and from thence along the Grande Prairie Wagon-road westerly to T.B.M. 156.

Character of Country surveyed.

Mr. Cautley states that along the north boundary of Township 77 from Pouce Coupe to the 120th meridian the line crosses two main ridges lying north and south, with approximate altitudes of 2,690 and 2,630 feet respectively, both being over 600 feet above the crossing of Pouce Coupe River; the soil is good and the surface is covered with thick poplar woods.

Through Townships 77, 76, and 75 the boundary runs in a hilly, timbered country, intersected by four high, flat-topped ridges from 150 to 600 feet above the intervening valleys. Most of the land in the valleys is suitable for homesteads and the soil is a rich loam that has been somewhat badly burned by forest fires in some places. Owing, however, to the generally hilly nature of the country and to the fact that the valleys are comparatively narrow and broken by small muskegs, the country is more suitable for stock-grazing than for farming at the present time. The surface can easily be cleared of its comparatively worthless timber by fire, and will then bear a heavy growth of wild grasses, peavine, and wild vetch, so that it will be possible to put up winter feed; this is essential, since he was given to understand by various stockmen of the district that the snowfall is heavy, and that it is necessary to feed stock from four and a half to five months, although horses have been known to winter out on the range. He saw some very fine hay lands along Tate Creek and the Pouce Coupe River which, he was told, had been covered with poplar and only burned for the first time four years ago. It is quite possible to burn such small timber as exists without injuring the soil if fires are set only when the soil is full of frozen moisture; at the same time nothing can be more disastrous to the future of the country than setting fires indiscriminately. Some of the land along the boundary has evidently been burned in the summer, so that every particle of humus has been burned out of the soil, and what was excellent land before the fire is rendered so worthless that it will take, perhaps, 100 years before the damage can be repaired by nature.

The whole country-side seems to be underlain by some porous form of substrata, if one can judge from the small and uncertain flow of the creeks, which does not seem to be in proportion to the watershed areas drained or the average precipitation. The Pouce Coupe River itself, which is the main drainage-channel of the district, carried a very small quantity of water towards the end of September, and several of the smaller creeks had dried up altogether.

Swan Lake.

Swan Lake was passed in Township 75 and is a pretty lake three miles long in a north-and-south direction. Former maps show the boundary to pass right through the lake, but it was found only to cut off a very small part from a little bay in the extreme north-east corner of the lake, although it follows the easterly shore for almost its entire length. Four permanent creeks empty into the lake, three small ones on its east side and a large one—named Tupper Creek on some of the published maps—from the south-west; at the north-west corner the lake empties into the South Branch of the Pouce Coupe River, which seems to carry about an equal volume of water as the East Branch crossed by the boundary.

GAME AND FISH.

Swan Lake is shallow and weedy along the shore and one of the finest water-fowl lakes for its size Mr. Cautley had ever seen; thousands of mallards and other good ducks breed there in summer, while geese were frequently seen, and swans were also reported. At the same time there must be deep water somewhere in the lake because whitefish are caught in it. Moose and bear were frequently seen on the line during September, and there are some mule-deer in the country.

DURATION OF WORK.

Mr. Cautley left Edmonton for Grande Prairie with four men on June 13th. He had tried to obtain all the seven men that he required ever since May 27th, but without success. A number of men came to see him in answer to advertisements, but wages were so abnormally high that even the excellent wages which he was enabled to offer were not sufficient inducement.

On October 7th he closed work and left for Grande Prairie, where he arrived on the 10th, when his party was paid off.

Mr. Cautley states that the party he had this year was not large enough to enable him to make progress satisfactory either to the Governments or to himself, and that owing to the scarcity of men it would have been impossible to get together a larger party in any case, but that now that the war is over it seems probable that there will be a number of suitable returned men whom the Governments will be anxious to employ next season.

TOPOGRAPHICAL DIVISION.

The topographical division, under Mr. Wheeler, organized at Banff and left that place for Field on June 25th. Travelling from Field to Howse Pass by way of the Amiskwi and Blaeberry Valleys, work was commenced on July 4th and the country west of Mount Conway covered, two stations on the watershed being occupied.

BUSH PASS.

Work was next carried to the Bush Pass and data obtained to enable the country lying along the watershed between that pass and Howse Pass to be mapped. The survey was also extended northward from the pass as far as the mountains surrounding permitted.

The summit of Bush Pass is a ledge of rock rising on the eastern side 500 feet or more above the valley-floor in a somewhat precipitous wall; it is inaccessible for horses. On the western side the ridge falls steeply 1,500 to 2,000 feet to the valley of a stream tributary to the Bush River. The gap of the pass at the summit is not more than half a mile wide between the mountain heights enclosing it. Owing to the pass being inaccessible for horses, all the work on the western side had to be done by back-packing in a very difficult and thickly wooded area.

HOWSE RIVER AND GLACIER LAKE.

On August 15th camp was moved to the mouth of Conway Creek, flowing northerly from Howse Pass to Howse River (Middle Branch of the Saskatchewan), and a peak, tentatively named Mount David, directly across Howse River occupied. Owing to bad weather two ascents of this peak had to be made before the required information could be obtained.

The party now moved down Howse River and established a camp at the head of the valley in which lies Glacier Lake. Glacier Lake is a fine body of water about three miles long by half a mile to a mile wide. It lies in a valley on the northern side of Mount Forbes and has its source of supply from a magnificent cirque of glaciers descending from the Mount Forbes, Mount Victor, and Mount Lyall groups of peaks and their incumbent ice-fields.

Two stations on the watershed were occupied, but owing to the wide ice-fields that had to be crossed it was found impossible to carry the work beyond it on the British Columbia side. All that could be done here was completed on September 2nd and the party then moved back to Howse River.

On September 4th Mount Sarbach, at the junction of Howse and Mistaya Rivers, was occupied, and on the 5th a move made for the Alexandra River (West Branch of the Saskatchewan) via Howse River and the Saskatchewan (North Saskatchewan). After three days' travel, for much of the distance over wide gravel flats intersected by numerous river-channels, camp was pitched directly at the summit of Thompson Pass.

Thompson Pass.

Thompson Pass Summit is a very picturesque spot, abounding in alpine meadow land interspersed with groves of spruce and balsam, and having two exquisitely coloured lakelets on the eastern approach and a small pond on the western. The gap is narrow, not much exceeding half a mile in width between the rock walls enclosing it. On either hand rises a sharp spire-like peak, that on the southern side having been named by Sir James Outram "The Watchman."

While there is a steep ascent both east and west of the summit, the approaches are not prohibitive to the construction of a road, and the central position of the pass and its distance from Howse Pass may in the future render it valuable for such a purpose as a means of communication with Bush River and the Columbia River on the western side.

Directly north of the pass rise the towering heights of Mount Bryce to close on 12,000 feet above sea-level, and northwards, beyond, lies the wide expanse of the great Columbia ice-field, with Mount Columbia rising a huge landmark from its western border. The ice-field sends out broad glacial streams in all directions—Saskatchewan Glacier, Athabaska Glacier, Dome Glacier, Columbia Glacier, and several others still unnamed. The area is collectively that of the highest peaks of the main range and is superbly picturesque in its varied features of towering rock, snow, and ice.

Beyond the watershed a path through the forest was cut for a distance of six miles down the valley of a tributary of Bush River, and two stations were occupied on the British Columbia side.

Alexandra River.

By September 15th all that could be done in the vicinity had been accomplished, and the party moved down the Alexandra River, occupying two stations on the northern side of the valley on the way out.

Alexandra River, like the Saskatchewan, has large stretches of gravel flat, with numerous intersecting river-channels flowing in many directions. It heads in a glacier from the Columbian ice-field, and some two or three miles from its source a branch valley leads westerly over the Thompson Pass. At the mouth are broad marshy meadows.

Close of the Survey.

On September 20th the party started for Lake Louise via Mistaya River and Bow Pass, being almost completely out of provisions. On the way out Observation Peak, at the summit of Bow Pass, was occupied to tie in the work with that of the previous season. The party was paid off on September 26th.

Game and Fish.

Rocky Mountain goat are seen high up on the peaks and are numerous. The tracks of elk and smaller deer are plentiful in the valleys, but the animals are wild and were seldom seen. Grizzly and brown bears were occasionally seen. The woods are full of grouse and ptarmigan frequent the alpine tracts above timber-line.

Fish are found in the Amiskwi and Blaeberry Rivers, but were not seen elsewhere and do not appear to inhabit waters so near the ice-fields.

Summary.

As a whole, the season has been fairly satisfactory. The country is very difficult of approach and much trail-cutting had to be done, a time-taking process for a party not equipped for that class of work. On the British Columbia side there are no existing facilities for approach to the watershed in the way of trails, and all had to be made, while wide ice-fields rendered the reaching of the watershed a matter of much difficulty and labour in most cases.

The latter part of July and the whole of August the weather was very bad for photographic surveying, which further added to the difficulties. September, on the other hand, was almost entirely fine, and not a day was lost except for the sheer necessity for an occasional rest from continuous climbing.

Taken altogether, the work is complete except in one part—viz., the basin at the head of Lyell Creek, which can be reached by going over the Thompson Pass and so carving a path to the valley of the main Bush River; or else by going down the Columbia River and up Bush River

from the mouth, an undertaking that would be out of the question, as it would require the best part of one season and be very expensive for so small a part.

Apart from natural difficulties, the unrest of war-time made labour a very uncertain proposition and the best of the kind required could not be had. I consider it a cause for congratulation that, all detriments considered, the work has been fairly satisfactory and has covered a very difficult section of the general area to be surveyed.

I have, etc.,

ARTHUR O. WHEELER,

Interprovincial Boundary Commissioner.

REPORT

OF

THE FOREST BRANCH

OF THE

DEPARTMENT OF LANDS

HON. T. D. PATTULLO, Minister

M. A. GRAINGER, Chief Forester

FOR THE YEAR ENDING DECEMBER 31ST

1918

PRINTED BY
AUTHORITY OF THE LEGISLATIVE ASSEMBLY.

VICTORIA, B.C.:
Printed by WILLIAM H. CULLIN, Printer to the King's Most Excellent Majesty,
1919.

Victoria, B.C., March 7th, 1918.

To His Honour Sir Frank Stillman Barnard, K.C.M.G.,
Lieutenant-Governor of the Province of British Columbia.

May it please Your Honour:

Herewith I beg respectfully to submit the Annual Report of the Forest Branch of my Department for the year 1918.

T. D. PATTULLO,
Minister of Lands.

The Hon. T. D. Pattullo,

Minister of Lands, Victoria, B.C.

SIR,—There are submitted herewith statistical tables with a brief comment thereon, covering the main activities of the Branch during the calendar year 1918.

M. A. GRAINGER,

Chief Forester.

REPORT OF THE FOREST BRANCH,
DEPARTMENT OF LANDS.

TRADE EXTENSION.

During the past year the fluctuating demand caused by the emergency nature of all business was reflected in the lumber industry of the Province.

The Prairie business was, as usual, very uncertain. The year commenced with good demand, and a good volume of business was done until about August, when the prospects of a light crop in many sections caused a curtailment.

The Eastern Canada market held strong throughout the year. It is estimated that over 150,000,000 feet of lumber, lath, and dimension was shipped during 1918. This is a record, and when compared with the 40,000,000 to 50,000,000 feet volume of pre-war business is very satisfactory.

The Department's Trade Commissioner visited the principal centres in Eastern Canada again during July and August. His report on this market may be summed up as follows: British Columbia, during the past two or three years, has obtained a footing which requires only sustained effort to secure for British Columbia timber a market for at least 250,000,000 feet a year. Our business can increase in all grades and all lines from box-shooks to clear timbers and finish. British Columbia lumber is in this market to stay, if the needs of the market are studied and our mills supply the material desired.

During the past three years some preliminary work has been done in investigation and development of overseas markets. While good railway systems provide adequate transportation facilities to the East, expansion to the West in the direction of Pacific markets of China, Australia, South Africa, and South America is strangled through lack of ships. Consensus of opinion is emphatic that round the Pacific is the real and ultimate overseas market for British Columbia timber.

At present Great Britain is the only market with shipping, and there is in addition an enormous emergency demand in sight for timber for reconstruction-work. In September the Department's Lumber Commissioner was sent over to England, and on the signing of the armistice all energies were bent to secure a full share of this business for British Columbia. Tonnage, of course, has controlled the situation. All importations to Great Britain have been handled by the Timber Controller, and up to the present any business which British Columbia could do must be through Government channels. Negotiations for large orders are still in progress at the time of writing this report.

The year 1918 has seen British Columbia timber most prominent in connection with the war. The rapid development of the Royal Air Force, with an ever-increasing demand for more machines, made spruce for aeroplane-construction of vital importance to the success of the Allies. In 1917 labour troubles threatened the source of supply from the Western States, and caused the Imperial Munitions Board to look to other sources for their raw material. The magnificent spruce stands of our Northern Coast offered a solution for the problem. Immense as these resources were, up to this time no serious effort had been made to exploit them for war purposes. Our total output of aeroplane spruce was an insignificant amount per month. Nearly all of it at that time was produced as a by-product in general commercial operations.

The British authorities were advised that in order to secure and maintain an adequate supply of aeroplane material an organized effort to secure the logging of the spruce regions would have to be made, and logging equipment and machinery would have to be transferred from the fir and cedar region of the Lower Coast to the Queen Charlotte Islands and Northern Mainland.

In fact, an industrial migration was necessary to provide not only for the logging of spruce, but also for towing, milling, and shipping of the largest obtainable quantities of it.

Towards the end of 1917 the Imperial Munitions Board sent a representative to British Columbia to investigate possibilities, and shortly thereafter the Board established at Vancouver a Branch of Aeronautical Supplies charged with getting an adequate supply of aeroplane lumber.

The factories of Great Britain and France were short of material. At a time when the United States had embarked on an aerial programme which would tax her productive capacity

to its limit a large portion of her output had to be shipped overseas to keep production going in France and England. Quick action was imperative. While the newly formed Imperial Munitions Branch was doing its utmost to secure cutting rights and establish operators, great delays were occurring in negotiations for suitable spruce areas. The Provincial Government therefore took drastic action, and commandeered all spruce timber by the following Order in Council:—

That the immediate supply of large quantities of aeroplane spruce is vital to the success of the war in the air.

That the Allies depend upon British Columbia, Washington, and Oregon to furnish this material.

That a most serious delay has already occurred in securing it, and that unless prevented further delays will continue to hinder immediate production.

That it would appear that one of the main causes of delay in the production of spruce is the time lost in negotiating for the right to cut standing timber.

That in this national emergency it is imperative that the Province of British Columbia shall contribute its full quota to the spruce production of the Pacific Coast.

That under these circumstances the Provincial Government finds itself obliged to take immediate and vigorous action to remedy the existing state of affairs, and for the reasons aforesaid to recommend:—

That the Minister of Lands be and he is hereby authorized and empowered:—

(*a.*) To forthwith arrange with the Imperial Munitions Board for the immediate logging of aeroplane spruce upon all areas of vacant Crown land that may be judged suitable for the purpose by the Department of Lands, as well as upon coal leases, coal licences, and mineral claims to which Crown grant or surface rights has not been issued:

(*b.*) To call upon all holders of Crown timber held under licence or lease which is judged by the Lands Department to be suitable for the purpose to proceed immediately with the logging of aeroplane spruce, and in default of compliance the Minister shall instruct the Department of Lands to arrange for such logging in co-operation with the Imperial Munitions Board:

(*c.*) To arrange with the Imperial Munitions Board on equitable compensation to be paid for timber so cut from any licence or lease.

This Order was subsequently supported by the "Spruce-cutting Act." Compensation was given to the owners of expropriated timber at a flat rate of $6 per thousand board-feet for No. 1 and $2.50 for No. 2 grade spruce logs. These figures were designed to cover waste in logging and all damages incidental to the selective logging of Nos. 1 and 2 spruce. While the powers under the Act for expropriation were exercised in comparatively few cases, their existence proved the necessary means to enable the Munitions Board to secure cutting rights without undue delay.

The Department in addition waived all the customary timber-sale procedure and allowed the cutting of spruce for munitions purpose under permit on all Crown lands.

The result of this organized effort to secure aeroplane spruce began to show early in the spring, and the production of accepted stock increased from month to month until the armistice was signed, as shown by the following table:—

SHIPMENT AND PRODUCTION OF AEROPLANE SPRUCE AND FIR, JANUARY TO NOVEMBER, 1918.

	Spruce, Feet.	Fir, Feet.
January	116,000	209,000
February	500,000	375,000
March	470,000	289,000
April	439,000	212,000
May	1,019,000	876,000
June	1,825,000	829,000
July	2,165,000	987,000
August	3,024,000	1,530,000
September	4,487,000	1,475,000
October	5,229,000	1,060,000
November	6,850,000	1,382,000
Total	26,124,000	9,224,000

At this time British Columbia was more than equalling the entire production of the Western States with all their resources in men and material, a result accomplished in eight months.

The Department issued 271 separate spruce permits, and in only eighteen cases was it necessary to use compulsion.

This selective logging of spruce was costly and extremely wasteful of actual wood material, as all No. 3 spruce, hemlock, and low-grade species were left uncut. This waste, however, is not a serious consideration when compared with the saving in time, when time meant a conservation of human lives more precious than any timber.

The shipping of 35,000,000 feet of aeroplane spruce and fir and the knowledge that we could, if necessary, continue to do so was no small factor in winning the war. The fine spirit of co-operation shown by the forest industries of the Province in this matter calls for especial notice.

Spruce Scaled for Royalty and charged to the Imperial Munitions Board.

The Timber Industry.

The final figures for the cut of the Province for 1917, compiled from returns supplied to the Forest Branch by the industry during 1918, are as follows:—

	Feet, B.M.
Lumber	1,200,544,000
Shingles, 2,390,000,000	239,000,000
Lath, 42,679,000	7,113,000
Poles, 3,654,000 lineal feet	5,481,000
Piles, 2,435,000 lineal feet	7,305,000
Hewn ties, 1,445,862 ties	46,267,500
Fence-posts, 11,755 cords	5,877,500
Mining-props, 67,668 cords	33,834,000
Total	1,545,422,000

	Feet.
Total production reported 1915	991,780,200
Total production reported 1916	1,161,750,000
Total production reported 1917	1,545,422,000

ESTIMATED VALUE OF PRODUCTION.

(These figures include transportation within the Province.)

From the appended table there will be noted a steady increase in value of production since 1915, and that 1918 figures are very nearly double those of 1915. The increase in value of about $6,000,000 over 1917 is probably accounted for by the high price obtained for spruce in 1918 and the gratifying increase in pulp production. Ship-building material also brought high prices, and a large quantity of timber was used in this new industry.

Product.	1915.	1916.	1917.	1918.
Lumber	$15,500,000	$21,075,000	$28,225,000	$26,219,697
Pulp	3,200,000	3,520,000	6,835,034	10,517,250
Shingles	3,500,000	4,500,000	6,900,000	5,805,417
Boxes	750,000	1,833,000	1,611,880	1,845,195
Piles and poles	1,200,000	650,000	467,695	394,871
Mining-props and posts	400,000	1,000,000	546,883	692,547
Miscellaneous (cut by railroads, mines, etc.)	900,000	1,150,000	1,425,815	1,773,821
Additional value constituted by the industry	1,750,000	1,650,000	2,145,880	1,689,810
Product of Dominion lands	1,800,000	*	*	4,953,329
Laths	150,000	150,000	142,282	120,278
Logs exported	.....	.....	.....	148,808
Totals	$29,150,000	$35,528,000	$48,300,469	$54,162,523

* Included in other items.

NOTE.—In addition to the total estimated value for 1918, there was an increase estimated at $840,000 in the quantity of logs on hand at December 31st, as compared with the corresponding date in 1917.

WATER-BORNE EXPORT OF LUMBER FROM BRITISH COLUMBIA.

Water-borne export of lumber from British Columbia in 1918 is shown in the appended table. It will be noted that the total of 88,069,029 feet is more than 100 per cent. increase over 1917 or 1916; 17,024,536 feet went to China and 19,803,335 feet to Japan, as against 1,672,871 feet and 1,590,246 feet respectively in 1917. War orders to the United Kingdom totalled 31,275,399 feet during the past year. These figures include 15,000,000 feet transhipped by rail for the United Kingdom.

TIMBER-SALES.

A comparison of timber-sales awarded during 1918 with those of the three previous war-years, 1915, 1916, 1917, is shown in the appended table. Aeroplane spruce disposed of during the year under the "Aeroplane Spruce-cutting Act" is not included in this table, as no timber-sales were awarded in the spruce belt owing to the operation of this Act.

The total value to the Crown of timber included in sales made during 1918 is approximately $380,000. This includes royalty, rental, and taxes on all sales, less costs of advertising, cruising, etc. This figure does not include revenue from aeroplane spruce cut under permit for the season. The total for 1918 is less than 1917, but it is higher than any other previous year by 50 per cent.

Sales are awarded for a number of reasons, such as:—

(*a.*) The economic disposal of small blocks of timber adjacent to existing operations.

(*b.*) The logging of areas which are potentially agricultural:

(*c.*) To supply local demands for firewood, ties, and mine-timber in small lots:

(*d.*) The disposal of defective and infected timber to check the spread of insect and fungus or other forest enemies.

Each sale is considered separately, and is cruised, surveyed, and advertised before being sold by public auction.

A number of sales of interest occurred in 1918. Applications for the purchase of ties doubled in 1918 over 1917, a large number being purchased in Prince Rupert District for the purpose of retying a section of Grand Trunk Pacific track.

In the Interior there was a boom in applications for firewood owing to the scarcity and high cost of other fuel.

A number of sales were awarded in the Vernon District of insect-killed western soft pine. These sales followed the discovery of a considerable area between Princeton and Nicola infested with bark-boring beetles, which were killing the standing timber at an alarming rate. The infestation appeared to be spreading rapidly, and recommendation was made that the timber already killed and dying should be disposed of as a measure to combat the spread of the evil. Dead and dying trees, freshly cut stumps and tops were found to be the breeding-places of the insects. Sales were made to holders of adjacent timber licences which were also affected, and stands of insect-killed timber no longer suitable for mill purposes were sold for cordwood. The cutting of this timber was to be carried on with special reference to checking the spread of these beetles, and allowances were made in the upset price, so that tops and slash should be piled on stumps and the whole burned, so as to kill the insects and prevent their menace.

If co-operation on the part of the operators of valuable pine limits adjacent in these measures is secured, it is considered an effective check will be obtained to the damage which is threatened. About 200,000 feet B.M. of damaged timber was salved in this manner.

TIMBER-SALES AWARDED BY DISTRICTS, 1918.

AVERAGE SALE PRICE BY SPECIES.

From the appended table it will be noted that stumpage prices bid on timber-sales reached a higher average in 1918 than in any previous year. A steady increase is noted on the five species which comprise the bulk of the timber sold. Douglas fir, spruce, cedar, hemlock, and balsam fir, in order, make up 90 per cent. of the total sales. On the other hand, prices on other species appear to be declining during the period. This is due to the fact that sales of fire-killed and insect-killed material, such as insect-killed western soft pine, are included.

Since 1915 the average selling-price of timber has risen considerably, and although logging and manufacturing costs have gone up greatly, the increase in stumpage was to be expected.

Average Sale Price by Species, 1918.

TIMBER CUT FROM TIMBER-SALES.

A comparison in the appended table of timber actually cut from timber-sales for the period 1915-18 shows a steady increase from year to year. The cut for 1918 doubled that of 1916, both in quantity and value.

The total cut of timber from this source amounts to only 7 per cent. of the total cut of the Province.

LOGGING INSPECTION.

There were 1,429 logging operations reported during the year 1918, 446 more than in 1917 and 585 more than in 1916. Twenty-two hundred and fourteen inspections were made on these operations by the Ranger staff of the Department. The object of these inspections on all classes of logging operations was to secure prompt transaction of business, give service to the loggers, and prevent trespass.

Inspection on Timber-sales.—Efforts were made to inspect operations on timber-sales once a month. Each timber-sale contract makes provision for the utilization of all merchantable material possible, penalties are provided for waste in tops and high stumps, merchantable timber not cut, and merchantable material cut and not removed. Each contract contains in addition a clause requiring disposal of brush and slashings under direction of an officer of the Forest Branch. It is necessary, therefore, to be on the ground frequently while cutting is in progress.

Inspection on all other Operations.—All other operations should be inspected once in three months to assist operators in matters of fire-protection, in tracing boundary-lines, and general supervision. The staff available for this work has been greatly reduced in the last two or three years owing to the number of enlistments of field officers of the Branch. During the fire season protection-work claims nearly all the time of those who remain. However, on the average, timber-sales were inspected every two months in 1918, and other operations on an average of once in eight months.

By a closer co-ordination of field-work a big improvement over last year was effected, and nearly double the total number of inspections were made with practically the same staff.

* Spruce permits.

TRESPASS.

Frequent inspection of logging operations may be relied on to prevent trespass cutting to a large extent. Poorly defined boundaries and ignorance on the part of loggers as to the limits of their operations are usually found to be the cause of trespass cutting. Intentional trespasses are becoming more infrequent each year.

The appended table shows fifty-seven cases in 1918. The total area cut over under trespass was 412 acres, and the average 7.2 acres for each case. In the beginning of the year there was considerable uncertainty as to what method would be adopted in handling the cutting of spruce for war purposes. Trespasses were committed before the machinery for handling spruce permits was in full swing, owing to mistaken impression which prevailed that spruce could be cut wherever found.

FOREST EXPENDITURE.

The sums voted for forest-work for the fiscal year 1918-19 were as follows:—

Vote 129—Salaries	$132,876
Vote 133—Travelling expenses	20,500
Vote 135—Lumber-trade expenses	5,000
Total	$158,376

In addition to this total, sums were available from Vote 132 for temporary assistance and from Vote 133 for office supplies, maintenance of launches and autos, and miscellaneous expenses. The sum of $120,000 was also voted as the estimated amount of the Government's contribution to the Forest Protection Fund.

General Administrative Expenditure.

(For Nine Months, April to December 31st, inclusive.)

PERMANENT IMPROVEMENTS.

List of Improvements in each District.

A total of $26,351 was spent on such improvements as telephone-lines, trails, boat-houses, and launch building and repairing during 1918. One launch is already in operation and two others are on the "slips." In addition, the increase of inspection-work in the Prince Rupert District, due to the war demand for spruce, necessitated the purchase of three new launches. A quantity of slash was burned at the expense of the Department this fall, thus tending to lessen the fire hazard for the 1919 fire season. Of the total sum disbursed, $10,407 was spent on the upkeep of existing improvements, upkeep of patrol-cars, with the necessary supplies of gasolene, oil, and tires. Ten new cars were added to the number already in the Forest Branch Service, materially increasing the efficiency of the fire patrol.

1919.

VICTORIA, B.C., February, 1919.

To His Honour Sir FRANK STILLMAN BARNARD, K.C.M.G.,
Lieutenant-Governor of the Province of British Columbia.

MAY IT PLEASE YOUR HONOUR:

Herewith I beg respectfully to submit the Annual Report of the Water Rights Branch of my Department for the year ending December 31st, 1918.

T. D. PATTULLO,
Minister of Lands.

VICTORIA, B.C., February 17th, 1919.

The Hon. T. D. Pattullo,
Minister of Lands, Victoria, B.C.

SIR,—I have the honour to submit the Annual Report of the Water Rights Branch of the Department of Lands for the year ending December 31st, 1918.

I have the honour to be,
Sir,
Your obedient servant,

E. A. CLEVELAND,
Comptroller, Water Rights Branch.

REPORT OF THE WATER RIGHTS BRANCH.

BOARD OF INVESTIGATION REPORT.

The work of the Board of Investigation during the year ending December 31st, 1918, included the determination of rights under Acts prior to the "Water Act, 1909," riparian rights, approval of undertakings, extension of time for commencement and completion of works under water records, and Indian rights.

Meetings of the Board of Investigation have now been held in all parts of the Province and preliminary hearings in regard to all of these claims, and approximately 7,500 have been dealt with. During the year, 1,296 formal orders were issued, 569 being directions to issue licences in substitution for records and 687 being cancellations of records. Some 2,500 orders have yet to be issued, of which 600 are for rights claimed by the different Indian Agents.

Section 6 of the "Water Act, 1914, Amendment Act, 1918," extended the time when a riparian proprietor might file a claim to water to June 1st, 1920. Up to date 110 such claims have been filed. The Board will deal with these claims after June 1st, 1920.

Section 79 of the "Water Act, 1914," provides that the Board shall hear the petition for approval of undertaking and report thereon to the Minister. Fifty-nine petitions have been filed, of which thirty-eight have been granted and twenty-one are pending.

A considerable number of applications for extension of time for commencement and completion of works under water records have been made, and extensions have been granted when it could be done without affecting injuriously later licensees who had made beneficial use of the water.

A large number of claims for water rights for the use of Indians have been filed during the past year. Surveys have been made by the Department's Engineers, and the Board is in communication with the Department of Indian Affairs with a view of arranging, as soon as possible, for the hearing of the claims and adjudicating upon the rights.

I have, etc.,

J. F. Armstrong,

Chairman, Board of Investigation.

DISTRICT OFFICES REPORTS.

KAMLOOPS DISTRICT.

The irrigation season of 1918 was probably one of the worst the Department had to deal with since its inception. A late and exceptionally dry spring, in which the snow was largely lost by absorption and evaporation, was the chief source of the trouble. Streams which ordinarily give no trouble were the subject of much contention; on many streams the usual freshet-discharge was non-existent, and as a result many storage-lakes were deprived of their supply and remained almost empty for the whole of the season. With such conditions it was inevitable that difficulties should arise in the division and distribution of water. In many cases it was found necessary to make orders for rotation, automatic division, or to entirely desist from using the water. The enforcement of an order by the ordinary means was impossible in some cases owing to the lack of control due to the unsatisfactory form of headgates. It is hoped that this difficulty will be overcome in the future by the installation of headgates of suitable construction.

Your Engineer travelled close to 3,300 miles by rail, about 2,200 miles by motor, and 100 miles by other means, in the pursuit of his duties during the season.

The season's field investigations were confined mainly to the Ashcroft Water District. Besides numerous small investigations, a survey in connection with a number of applications on Ashcroft or Barnes Creek was made. Of chief interest, perhaps, to the citizens and ranchers of Ashcroft and vicinity was an investigation into the possibilities for the irrigation from the Bonaparte River of certain lands lying north of the Basque Ranch and west of the Bonaparte and Thompson Rivers. The irrigable area was found to be far smaller than estimated, and the feasibility of the scheme appears to be subject to the relinquishment to the Province by the Indian Department of a large portion of the Ashcroft Indian Reserves Nos. 1 and 2.

A new dam was built in the spring on Monte Lake, and another in the fall on Edith Lake. Both dams replace old ones that were a menace to the public, and it is satisfactory to note that it was possible to bring the parties interested to realize the necessity of complying, in their own and the public interest, with our orders.

Storage by Senator H. Bostock in the near future of the freshet-water of Monte Creek is contemplated. The site of the proposed reservoir is located in the Monte Hills Forest Reserve, and from an examination made on the ground and plans on file the project seems feasible. The lands to be irrigated from this proposed supply form a part of the Bostock Ranch at Ducks, and will bring some hundreds of acres of first-class land under cultivation.

Pumping water for irrigation by hydro-electric or gasolene engine appears to have passed the experimental stage. During the season two new electric pumping plants were put into operation—one on the South Thompson River for the Kamloops Industrial School, and the other on the Josephine Ranch on the North Thompson River. Both plants were successful, and it is reasonable to suppose that a still greater advantage will be taken of this form of irrigation in the future.

I have, etc.,

C. VARCOE, A.M.E.I.C.,

District Engineer.

OKANAGAN DISTRICT.

The past year was a very prosperous one in the Okanagan Valley, the crops having been a fair average and prices high. It is estimated that $4,000,000 worth of farm produce was shipped out of the valley last year, which is slightly greater than the total amount of capital spent on irrigation-works in the valley, and the greater part of the produce shipped was grown on irrigated land. Kelowna exported $1,100,000 of farm produce during the past year, every bit of which was grown on irrigated land.

The total capital spent on irrigation-works tributary to Kelowna is approximately $1,605,000. These figures are, I think, a conclusive answer to those pessimists who five years ago advocated the abandonment of all the irrigation systems in the Okanagan Valley and the return of the irrigated lands to their former state of cattle-ranges; especially when it is considered that all the orchards under irrigation are not in full bearing, and that there are many thousands of acres which have not been brought under cultivation.

There was no great additional quantity of land brought under cultivation and irrigation in the Okanagan Valley last year, but for the last five years there has been a small and steady increase in the area under cultivation and irrigation; the cumulative effect of which is now becoming apparent in a considerably increased draught on all the streams and irrigation systems in the valley. Also the majority of the orchards planted are now coming into bearing and require twice the amount of water that they did when first planted out. The combined result of the increase of land under cultivation and the increase in age of the orchards was that with a few exceptions there was a general shortage of water all through the Okanagan Valley last fall. With only three exceptions, the capacity of the reservoirs was not sufficient to meet the requirements of the lands they served, and many of the lands that were irrigated from streams, the flow of which had been supposed to be ample to meet the requirements of all lands adjacent, had insufficient water last fall. If any more land is to be brought under irrigation in the valley, or if even that now under irrigation is to be brought to its maximum state of productiveness, then it is imperative that the reservoir system of the valley must be largely increased, both by the construction of new reservoirs and the enlargement of existing reservoirs wherever possible.

Realizing the necessity of increased storage-reservoirs, the following companies and communities either constructed or started construction of storage-reservoirs:—

The Kelowna Irrigation Company built a crib log dam 22 feet high and 250 feet long at the outlet of South Lake, situated on the South Fork of Mill Creek. This reservoir is capable of holding 800 acre-feet.

The owners of 1,000 acres of land at Ellison, to which the waters of Scotty Creek are appurtenant, started an earth dam at the outlet of Trapper Lake, which drains into Scotty Creek. On account of the shortage of labour they only got the foundation cleared off.

At Naramata, the land-owners having arranged for a loan of $10,000 from the Conservation Fund, started construction of an earth-fill dam at the outlet of what is known as the Big Meadow on Chute Creek. On account of the lateness of the season when the work was started—last week in September—and the difficulty of getting competent labour, little progress was made in building the dam, the work done consisting of the erection of two log cabins, clearing and stumping the site, clearing off the surface dirt from the south half of the site, digging trench for outlet culvert, and laying foundations for outlet culvert. The work closed down on November 4th, there being then 1 foot of snow on the ground and hard frost at nights. The proposed dam will be 18 feet high, 627 feet long, and capable of storing 700 acre-feet of water.

At Peachland, the land-owners under the existing irrigation system having arranged for a loan of $5,000 from the Conservation Fund, started the construction of an earth dam with concrete core wall at the outlet of their present reservoir on the North Fork of Deep or Peachland Creek. The work started on October 8th and closed down on November 17th on account of snow and frost. The site for the dam had been cleared and stumped, the core wall and spillway built, and about one-third of the earth fill made when the work closed down. Three weeks to a month's work should complete this dam in the summer. The height of dam is 8 feet, length 232 feet, and should impound 250 acre-feet additional water.

Messrs. McKinnon *et al.* constructed a small reservoir on Jack Lake, which drains into Powers Creek, for the purpose of irrigating District Lot 3188. This reservoir was formed by digging an outlet drain from the lake 6 feet deep and 450 feet long, and placing a bulkhead and gate to the same, with a small crib dam on top. This reservoir should store 500 acre-feet and is capable of considerable enlargement as requirements warrant it.

D. Gellatley also constructed a small reservoir on a small lake above Jack Lake, and which drains into same, by building up an old beaver-dam and putting a gate in same. This reservoir will store about 60 acre-feet as at present.

The Summerland Municipality, I believe, increased their storage by raising some of the existing reservoir dams, and also, I believe, did a considerable amount of reconstruction-work.

The Municipality of Penticton have during the year laid 1,100 feet of 4-inch wood pipe and 2,250 feet of 6-inch pipe, or a total of 3,350 lineal feet of irrigation-pipe, to withstand a pressure of 100-foot head; replaced 1,400 feet of the old Ellis Creek main flume by a new 3- x 2-foot wooden flume, tongued and grooved, set in concrete footings. They have also replaced the old log intake on Ellis Creek by a solid concrete intake, which cuts off the seepage losses that used to take place through the old crib. Some 30,000 feet B.M. of lumber has also been used in general repair-works on the system.

The Kelowna Irrigation Company had their 32-inch steel siphon across Mill Valley scraped and painted inside last spring, at a cost of $4,450; this was a very necessary repair, as it was becoming badly corroded internally.

The same company's main distribution system supplying the Glenmore and Rutland Valleys being in need of immediate repairs, and the company not having the funds to make same, the land-owners under the two systems arranged for a loan of $20,000 from the Conservation Fund for repair-work. This work started the last week in September and closed down on November 26th on account of snow and an outbreak of Spanish influenza in the Rutland camp. The work consisted of, in Glenmore District: The relining of 1,620 lineal feet of main ditch; new bottoms in 555 lineal feet of main ditch; relining of 1,060 lineal feet of Lateral 1; relining of 510 lineal feet of Lateral 3; new bottom in 60 lineal feet of Lateral 3; or a total of 3,805 lineal feet repaired. This work was necessitated by the cracking and collapsing of the sides of the concrete ditches and the cracking and disintegration of the bottoms.

The cracking of the sides was due to two causes—the expansion of the stiff clay at the back of the concrete lining, due to moisture, also, and principally, to surface water getting behind and under the lining in the early spring during the day and freezing at night. This has completely wrecked a large part of the concrete ditches in Glenmore. Another cause which has contributed to the cracking and destruction of long lengths of ditch was the placing of a board longitudinally underneath the bottom of the ditches for the purpose of forming a cover to a stone drain laid underneath same to carry away seepage-water. This board swelled and burst up the bottom for thousands of feet. Where the ditches were built through a gravelly formation they are in a fairly good condition, though none of them are in the condition that they should be if proper material and care had been used in their construction. The concrete of which the lining of the ditches is composed is of a very porous nature and anything but watertight; on account of this there is a very great seepage loss, not only through the cracks in the ditches, which are many, but also through the concrete itself, the result being that considerable tracts of land all through the valley underneath the ditch system have become water-logged, and the trees, both pine and fruit, are dying. The injurious effects of this seepage-water may be partially overcome by subsoil drains, but the ditches themselves should be relined when badly cracked and coated with a water-proofing material such as pitch or asphaltan.

As a large part of the company's Rutland main ditch system is formed of wooden flumes, which were in a poor state of repair and leaking very badly, but not so badly dilapidated as to necessitate rebuilding, 4,500 lineal feet of flume in this ditch were lined last fall with a layer of tar-felt covered with ½-inch boards. The company's chief bailiff had tried this on several lengths of flume the year before and found it satisfactory. It will stop the great loss of water through leakage and prolong the life of the flume four or five years at least.

The Canyon Creek Irrigation Company replaced 2,960 lineal feet of distribution-flumes by new flumes, strengthened and repaired the dam at their Reservoir A on Canyon Creek, installed measuring-boxes on their distribution system, and did a considerable amount of general repair-work.

I have, etc.,

F. W. GROVES, M.E.I.C.,

District Engineer.

GENERAL REPORTS, ETC.

HEAD OFFICE GENERAL WORK.

STAFF.

The number on the staff remains about the same, being twenty in December, 1918, compared with eighteen reported for the previous year. In order to cope with the pressure of field-work during the year the services of four of the men in the draughting-room were utilized for varying lengths of time.

Mention must be made of the death from influenza of H. G. Lawley, Assistant Engineer in the Nelson District, who had rendered for some years faithful and efficient service to the Department.

APPLICATIONS, ETC.

On receipt of an application it is entered on the water-rights map or reference map and a note made of any further information required, on receipt of which the conditional licence or authorization is issued.

The number dealt with during the year is as follows: Applications received, 212; conditional licences issued, 245; final licences issued, 15; authorizations issued, 9; applications withdrawn, lapsed, or cancelled, 188.

In connection with the reallocation of space in the vault, one of the Engineers was deputed to represent this Branch; the files were carefully looked through and rearranged systematically, and about 1,200 that were closed and dealt with matters not likely to be raised again were removed to save time and space in locating current files.

The checking of plans for Class "C" licences, preparation of several reports on power possibilities in various parts of the Province, compiling and revising lists of the rights on special streams, and of all rainfall stations and waterworks in British Columbia, and calculations of discharge of water over weirs, through pipes and openings under different conditions of slope and head, have formed a good part of the year's work.

REVENUE FOR YEAR ENDING DECEMBER 31ST, 1918.

Purpose.	Application Fees.	Rentals.	Total.
1. Power	$1,343 50	$ 7,365 05	$ 8,708 55
2. Irrigation	726 59	3,992 38	4,718 97

COMMISSION INVESTIGATING IRRIGATION COMPANIES.

J. S. T. Alexander, E. Davis, and F. H. Kidd, who were appointed as a Commission under the provisions of section 171 of the "Water Act," as amended in 1917 and 1918, report as follows:—

"By Order in Council No. 1300 we were appointed to examine and report upon the financial condition of the Canyon Creek Irrigation Company, Limited, the general condition of its water system, and its ability to fulfil its obligations to persons using water from its works.

"On January 16th, 1918, we proceeded to Kelowna, where we examined the books and inspected the works of the company and took the evidence of numerous water-users and representatives of the company.

"By Order in Council No. 1615, approved on April 9th, 1918, we were appointed to make similar investigations of the affairs of the Kaleden Irrigation and Power Company, Limited. The books of this company were in the custody of its secretary in Vernon, where Mr. Kidd examined them. While he was so engaged Mr. Davis inspected the company's works from the intake on Sheep Creek to the lands at Kaleden where the water is used. On April 19th we all met at Penticton and the next day proceeded to Kaleden, where we heard the evidence of the water-users there. On the 20th, at Penticton, we took the evidence of Mr. Latimer, the engineer who laid out the works and subdivided the lands at Kaleden, and of J. M. Ritchie, the managing director of the Kaleden Irrigation and Power Company, Limited.

"By Orders in Council Nos. 2091 and 2260, approved July 22nd, 1918, and September 6th, respectively, Mr. Davis, Mr. Roberts, and Mr. Alexander were appointed to investigate the affairs of the Kelowna Irrigation Company, Limited; the Central Okanagan Land and Orchard Company, Limited; and the Central Okanagan Lands, Limited, under the section of the 'Water Act' above referred to. On September 18th and 19th, in Kelowna, we met and examined many of those using water from the Glenmore part of the Kelowna Irrigation Company's works, and in the evening of the 20th we went to Rutland school-house, where we secured further information concerning the Irrigation Company's affairs, more particularly with respect to the irrigation of lands in the Rutland Subdivision.

"The Kelowna Irrigation Company and the Central Okanagan Lands, Limited, being in the hands of a receiver whose office is in Vancouver, Mr. Roberts spent some days there and made a thorough examination of their books. He also examined the books of the Central Okanagan Land and Orchard Company which were produced by the officers of that company.

"Reports on all these companies have been compiled by us and submitted to His Honour the Lieutenant-Governor in Council."

IRRIGATION.

VERNON.

In view of the fact that during the past few seasons there was a shortage of water under the White Valley and Coldstream Internal irrigation systems, representations were made to the Department to make an investigation as to what extent the water-supplies could be augmented. It is very evident that if the water-supply is at present deficient for the land under irrigation it will be more so in the future when more land is using water. In view of the fact that the continued operation of the White Valley system is dependent on an increase in its revenue, it is of vital necessity that more water be available.

Accordingly, J. F. Rowlands, A.M.E.I.C., was detailed to undertake the work. His report is as follows:—

"White Valley Irrigation and Power Co's Water-supply.

"Work in connection with the above was commenced in September. A general investigation of the headwaters of Jones Creek was made; each branch of the stream was examined for discharge and relative storage value. The time available was not sufficient to complete the field-work, and a number of reservoir-sites are not yet surveyed or cross-sectioned. The figures given are subject to reasonable adjustment upon completion of the surveys. The matter of costs cannot be considered at this stage, and is deferred until the field-work is finished and the whole system and scheme ready for consideration, including the proposed supplementary supply from Harris Creek.

"*Jones Creek.*—A high percentage of the total water discharged comes through two branches of the creek, viz.: (1) The East Fork, flowing through Aberdeen Lake; (2) the South Fork, which drains the Grizzly hills.

"The East Fork drains some 14,000 acres behind the dam at Aberdeen Lake and a mean annual discharge of 8,000 acre-feet of water can be developed. Storage accommodation for this amount can be developed by raising the existing dam 5 feet and replacing the present culverts by one at a 2-foot lower level. The dam is in a dangerous condition and in need of considerable repair, including culverts; when the latter are opened up the construction at a lower level should be carried out.

"The South Fork, including Haddo Lake, drains some 15,000 acres and the mean annual discharge is estimated at 8,500 acre-feet of water. A dam at the outlet of Haddo Lake would pen back about 1,500 acre-feet of this; it is not established that the other sites available are large enough to store the remaining volume. There are large swamps about a mile above Haddo Lake that may hold a considerable portion of it, and these are the most important of the unsurveyed sites, having an extensive drainage area behind them.

"*Fish Lakes.*—As reservoirs, these lakes are not suited to the conditions, their areas being too large in proportion to the volume of water available for storage, resulting in a very high percentage of loss through evaporation; also their outlets are unfavourable. There is a suitable site for a dam on Fish Creek situated at the outlet of a large swamp and meadow about three-quarters of a mile from its junction with the main stream. A survey of and capacity of this site is required. It is estimated that 500 acre-feet of water will be available for storage at this point. This will include the Fish Lakes drainage.

"Mud Creek and Summit Creek are small freshet streams discharging together about 500 acre-feet of water annually. There are small swamps on both creeks that will probably hold this amount; the outlets are suitable for dams; these sites are not yet surveyed. The large Summit Lake is not suitable for a reservoir, for the reasons applied to Fish Lakes.

"Referring in general to Jones Creek and its tributaries, an unusually high percentage of the total discharge is available for storage owing to the reservoir-site on each branch being located near its mouth, thus making practically the whole drainage area effective and subject to control. It will be noted that the estimated mean discharge available for storage—viz., 17,500 acre-feet—is high when compared with observations of the total discharge taken at the company's weir and headgates, the seven-year mean of which is 19,000 acre-feet, covering a four-months' recording period annually. From examination of the weir where the records are taken, a high velocity of approach is suspected, which during the high run of the creek would considerably increase the calculated discharge; further, a four-months' period does not approximately represent the total discharge of this stream. In support of this statement it was observed that the two main branches of the creek were discharging a considerable volume of water last September and October.

"*Harris Creek.*—To obtain information upon the feasibility of bringing water from Harris Creek to supplement the Jones Creek supply, a preliminary ditch-location line was run, commencing at the White Valley headgate. The point of diversion on Harris Creek would be approximately eight miles on grade from the headgates on Jones Creek. For about 75 per cent. of this distance the conditions are favourable for ditching; the remaining portion could be flumed.

"The first mile in the Harris Creek Canyon is on a steep rocky side-hill, part rock-slide. Owing to shortness of time available only work of a preliminary nature was attempted; the investigation should be continued in detail and a close location and estimate of cost made. Unfortunately no discharge records of Harris Creek are available, but it appears to be a larger stream than Jones Creek. Nothing is known of the drainage area. An extension of the photo-topographical survey (Surveys Branch) to include Harris Creek would be of great assistance to the Water Branch, as ultimately this stream will figure prominently in irrigation adjustments in this district.

"*Deer Creek.*—Deer Creek is the source of the water-supply for that portion of the Coldstream Estate irrigated from the King Edward ditch. An investigation of its watershed has been made and the maximum storage possibilities ascertained. King Edward Lake is the only storage-site on the stream of any importance. A chain of swamps and a small lake about 15 acres in area, situated within the King Edward Lake catchment, are of no consequence,

inasmuch as the main site fully developed will provide storage for all the water available. The area draining into King Edward Lake is about 1,600 acres. The mean annual run-off from this area is estimated to be 1,000 acre-feet.

"The capacity of the existing reservoir is 860 acre-feet. By drawing the water off at a level 2 feet lower than the present outlet and raising the dam 2 feet the storage capacity is increased to 1,100 acre-feet."

ASHCROFT.

A petition was filed with the Department by a number of land-owners near Ashcroft, requesting that a survey and report be made as to the feasibility and practicability of irrigating certain lands from the Bonaparte River. A. G. Hatton, acting under instructions from District Engineer Varcoe, undertook the surveys required. The substance of the report is as follows:—

"It has been assumed locally that the Semlin Valley could be supplied from the Bonaparte River, but the following figures prove to the contrary:—

Place.	Elevation.
Boston Flat ditch near Cache Creek	0
Bridge over Bonaparte River at Cache Creek	—98
Bridge over Cache Creek to Parke's Ranch	—42
Ground-level, south-west corner of Lot 3, Group 2	+209
Western Canada Ranching Company's ditch from Cache Creek	+256
Ground-level, north-east corner of Sections 20, 21, and 24	+274

"Another local assumption has been that it is possible to divert Hihium Creek directly into a branch of Cache Creek.

"The investigations indicate that it would not be possible to divert water from this source directly into Cache Creek. Hihium Creek is a very sluggish stream and meanders through wild hay meadows, for the first two or three miles of its course having practically no fall, while the country at the east end of the lake falls towards Deadman's Creek, the physical nature of the land being such as to make a diversion from this direction to Cache Creek out of the question.

"It being impracticable to include the Semlin Valley in a project taking water from the Bonaparte River, we directed our attention to a determination of the irrigable area of the lands on the western side of the river. The result of the survey was disappointing, so much so that instead of running a grade-line for a ditch as at first intended, it was decided to obtain some approximate data upon which rough figures as to probable cost might be based. For this purpose a tie for elevation was made on the old Boston Flat ditch; although this ditch was a failure, it actually carried water to a certain point, but in insufficient quantities. The ditch was found to be 66 feet lower than the control-point on the lands under the project, and it was assumed that a ditch to supply the lands would take its point of diversion at least 66 feet higher than the Boston Flat intake plus the additional head for grade. From levels taken above the proposed intake a rise of 77 feet was found in a distance of about three miles, and it indicates that it would be necessary to go from 5 to 6 miles above the said point to obtain the required grade, making the ditch-line, including about six miles of flume, about nineteen miles in length. It is believed that this is a sufficient guide in determining the advisability of further investigations or the contrary."

GRAND FORKS.

During the latter part of 1917 and a short time in 1918 preliminary surveys were made to determine the feasibility and practicability of irrigating certain lands in the vicinity of Grand Forks either by pumping or gravity systems. From the investigations made it would appear that it is not feasible to obtain a gravity supply from the North Fork of the Kettle River, and that it is necessary to make a diversion from the main Kettle River at a point approximately seven miles south of the boundary. Owing to the difficult nature of the ground through which the conduit would pass, further investigations are to be made so that the estimated cost may be determined.

CRESTON.

A petition was filed relative to the construction of an irrigation system near Creston. The late H. G. Lawley, assistant to District Engineer Biker, commenced the surveys for this scheme,

but unfortunately, owing to his contracting Spanish influenza and his subsequent death thereby, the work was not finished. It is the intention to proceed with this work at an early opportunity.

Keremeos.

In view of the fact that there is a large area of bench land near Keremeos which could be irrigated from an extension of the Keremeos Land Company's irrigation system, C. A. E. Shaw was employed to make a report on the feasibility and probable cost. The substance of his report is as follows:—

"A survey was made for an irrigation-ditch from the end of the Keremeos Land Company's ditch at Keremeos to the north boundary of the Similkameen Fruit Land Company's property. From this point, with the exception of a few acres at the north-east corner of the latter company's land which can be irrigated from Barcelo Creek, the water can be taken to any part of the property to be irrigated.

"The ditch would be about three miles and three-quarters in length, and by careful location all but a few hundred feet of this can be made in ditch. A flume would be required at the crossing of Keremeos Creek, one or two short flumes at Stations 151 to 160, and a flume or siphon about 700 feet in length at Stations 167-174. Several other short flumes would also be required.

"A rough estimate of the cost would be about $7,000—say, $4,500 for excavation, $1,500 for rock-work and boulders, and $1,000 for fluming. This is exclusive of the cost of right-of-way, which would probably be expensive up to Station 70, especially if the ditch crosses the road to the north side, as most of the land is planted in orchard, and it might be necessary for this reason to carry the water through part of this distance in underground pipes.

"There are at present about 800 acres under irrigation supplied from the Keremeos Land Company's system, and this system would have to be enlarged, as an additional 800 acres would require water.

"Keremeos Creek cannot be relied upon as a sole source of supply. There are, however, one or two reservoir-sites on the watershed which might be developed to advantage, although there is no definite data at present; this can be obtained by sending out a survey party during the 1919 season.

"Ashnola Creek would have to be relied upon for the major part of the water-supply, and consequently the Keremeos Land Company's system would have to be enlarged to carry this water."

Conservation Fund.

Owing to the shortage of water under a number of irrigation systems in the Okanagan Valley, it has been necessary for the Government to come to the assistance of the water-users. For this purpose a fund called the Conservation Fund has been set aside, and the moneys spent therefrom are to be a first charge against the assets of the companies operating the systems and against the lands which are served by the systems. The works contemplated or being constructed are as follows:—

Project No. 1—Storage-dam at Big Meadow for the system at Naramata.

Project No. 2—Raising the dam at North Fork, Peachland, to increase the storage.

Project No. 3—The drainage of three sloughs in the vicinity of Rutland. Owing to the rise in the water-table of some lands, due to irrigation, this work is very necessary.

Project No. 4—The repairs to the irrigation system of the Kelowna Irrigation Company.

Project No. 5—The construction of a system of flumes at Scotty Creek near Kelowna to replace ditches, thereby conserving the water-supply.

Project No. 6—The repairs to the White Valley Irrigation and Power Company's system at Vernon.

The work on Project No. 1 at Naramata was commenced on September 28th and continued until November 4th, when owing to the frost and snow it was not economical to continue. The storage of water to furnish an adequate supply to the land being served by the Naramata system is an expensive undertaking, as there are no reservoir-sites of any large size available, and what there are require expensive dams. It was suggested that Chute Lake be used as a reservoir, but owing to the location of the grade of the Kettle Valley Railroad it is impossible to store more than 400 acre-feet of water at this site. This alone precluded utilizing same, although the use

of this water would have necessitated a long conduit from Chute Creek to connect to the present system, and, further, it would prevent the lands nearer Chute Creek from being developed.

The site at which the dam is being erected is known locally as Big Meadow. The capacity of the site is as follows:—

Elevation of Contour.	Area of Contour in Acres.	Contents between Contours in Acre-feet.	Accumulated Contents of Contours in Acre-feet.
5,280 feet (0)	32.1	....	....
5,285 „ (5)	40.8	182	182
5,290 „ (10)	56.8	243	425
5,295 „ (15)	69.5	316	741
5,300 „ (20)	79.8	373	1,114
5,305 „ (25)	89.2	422	1,536

The catchment area above the dam-site is approximately 2½ square miles (1,600 acres), and assuming that the average precipitation over this area is 20 inches per annum, there should be a total of 2,660 acre-feet of water fall upon the 1,600 acres. Allowing 25 per cent. of this water as the estimated run-off, there should be approximately 930 acre-feet available for storage. The dam is at present being constructed up to an elevation of 18 feet and should be capable of storing 700 acre-feet of water.

The work on Project No. 2 at Peachland was not commenced until October 8th. It consisted of increasing the height of the existing dam 6 feet. The dam as originally constructed had a concrete core wall; this raised the 6 feet and as completed is 217 feet long. A concrete and stone spillway 20 feet wide was provided at the south end of the wall. An earth fill 8 feet wide on top on each side was brought up to within 2 feet of the top of the wall. It is estimated that 50 per cent. of the earth fill is in place. The channel of the stream below the culvert outlet was cleaned out and deepened for a length of some 200 feet.

This reservoir is situated on what is locally known as the North Fork of Peachland Creek (Deep Creek). The catchment area is four square miles and the capacity of the reservoir before the commencement of the work this past season was 531 acre-feet. This has been increased to 850 acre-feet by the new work. The contents of the site are as follows:—

Elevation of Contour.	Area of Contour in Acres.	Contents between Contours in Acre-feet.	Accumulated Contents of Contours in Acre-feet.
0.00	48.87	.....	Sill of outlet.
5 feet	52.95	254.55	254.55
10 „	60.02	282.40	536.95
15 „	65.87	314.70	851.65
20 „	72.15	345.05	1,196.70

From the data available there should be at least 1,000 acre-feet of water run-off from this watershed above the reservoir-site.

Work in connection with Project No. 3 has only just commenced, owing to the fact that the organization of the Rutland Drainage District was incomplete. As it will take some time before all the requirements of the "Drainage, Dyking, and Development Act" are complete, it was decided that the construction of the main drainage-ditch should be undertaken before the water-table rises, due to the spring run-off, thereby saving considerable extra work. Preparations are now under way to undertake the work.

Work on Project No. 4, being the repairs to the Kelowna irrigation system, was commenced on September 26th and continued until November 26th. During this time a total length of 3,805 feet of concrete ditch was either fully or partially relined in the Glenmore section of the system, while a total of 3,500 feet of wood flume was lined with tar-felt and lumber in the Rutland section of the system.

No work has been undertaken on Project No. 5 up to the present, as the farmers were too busy in the fall to take up the matter of construction or organization of their district. Directly the district is properly incorporated it will be possible to proceed with the works.

The work on Project No.-6 was carried out by the White Valley Irrigation and Power Company, and consisted of making necessary repairs and improvements to the system.

WATER-POWER.

In view of the development of the pulp and paper and other industries, it is very desirable that water-power investigations be carried further, as upon reports of this nature will depend very largely whether capital can be interested or not. The Commission of Conservation had several survey parties in the field a few years ago, but their operations consisted in merely locating a possible power-site, ascertaining the probable head, and making measurements of the stream-flow while in the vicinity. What is now desirable is to follow up these preliminary reports by ascertaining the character and boundaries of the watersheds and establishing stream-gauging stations. The lack of this information has resulted in more failures of power developments than any other cause.

The report of W. Blane on the power possibilities on Queen Charlotte Islands which he carried out during the summer of 1918 is as follows:—

"Ain River.

"*Source.*—The Ain River, flowing into Masset Inlet at Indian Reserve No. 6, about two miles north-east of Buckley Bay sawmill, is the outlet of a chain of lakes on the north side of Masset Inlet. Of these lakes the largest is Ian, having an area of 5,400 acres or 8.4 square miles; it is connected by a channel half a mile in length with Skundale Lake, the area of which is 320 acres or 0.5 square mile. The fall from the large to the smaller lake is less than a foot in the half-mile. From Skundale Lake another channel of about two miles in length, both channels being navigable by canoe or light-draught boat, leads into Ain, the smallest lake of the series, the area of which is about 200 acres. The fall between these two latter lakes is about 4 feet.

"From Ain Lake the Ain River flows in a winding channel in a general south-easterly direction to Masset Inlet; the difference in elevation between mean low water of Ain Lake and mean high-tide level of Masset Inlet being 124 feet.

"*Drainage Area.*—The drainage area covers approximately 98,800 acres or 155 square miles of territory. This is mountainous and heavily wooded over the greater portion, the exceptions being the higher mountain-sides, which are bare, and occasional stretches of open muskeg. There is also in many places a dense undergrowth of salal, whilst spagnum and other mosses abound, making ideal natural conditions for a gradual and economical precipitation run-off.

"The precipitation data used is taken from the Meterological Report for 1916-17 of Masset Station, covering an observation period of seventeen years, with an allowance of 8 inches per year increase, due to local conditions, as the Ian Lake neighbourhood, owing to its mountainous character, is said to average greater annual precipitation than the country in the vicinity of Masset.

"The precipitation at Masset, according to said Meterological Report, is 52 inches, and allowing an increase of 8 for local difference, this would give to Ain Lake and vicinity a precipitation of 60 inches.

"This applied to the drainage area in question will give a total precipitation of 494,000 acre-feet, or sufficient to produce a run-off of 550 feet per second, allowing that 14 per cent. is taken up in evaporation and 6 per cent. in plant-structure.

"*Characteristics of River.*—The river may be said to be divided into two parts—the first beginning at Ain Lake and terminating at the West Fork of the river, and the second beginning at the West Fork and terminating at Masset Inlet.

"The first part, from Ain Lake to the West Fork, covers a distance of a little less than a mile. In this distance occurs 105 feet of the total 124 feet of fall between the low-water level of Ain Lake and mean high tide of Masset Inlet. For this portion of the river the banks are in general high, the bed is of rock of very uneven surface, and low falls are of frequent occurrence.

"The second part of the river, that is from the West Fork to tide-water, although of considerably greater length than the first part, has much less fall, and in consequence a slower flow, whilst the banks have flattened out to a considerable extent.

"The average width of the river throughout is about 60 feet and the average central depth probably 2 feet, but the river-bed is so uneven and full of rock pockets that it is difficult to determine an average uniform depth.

"*Volume.*—Several gaugings made on the river between the proposed dam-site and the entrance to the lake gave a mean of 317 cubic feet per second. This may be regarded as mean low discharge.

"Gaugings were also taken at the same place in August, 1917, by E. A. Cleveland, of Vancouver, who had installed here an automatic water register. The foundation for this instrument he built of such a height as to ensure that the instrument itself would be above the reach of the highest flood. In deciding on this high-water mark he had been guided by local information covering a number of years, and also by erosion and other water-marks along the bank; however, in November, 1917, the waters of the lake rose to an unusual height, completely covering the water register. When this flood stage was at its height a durable mark recording the elevation was made on a tree close to the guaging-station. In August, 1918, at the time of extreme low water in Ain Lake, a measurement was made from extreme low-water mark to this mark on the tree, and the difference was found to be 11 feet.

"Using the same stream velocity as before, also the same cross-section for the bed of the stream, but with the additional 11 feet of water, the flow would be augmented by 3,850 cubic feet per second or a total extreme high-water flow of approximately 4,200 cubic feet per second.

"*Storage.*—The natural storage-basin of Ian Lake, about 10 square miles, will yield a minimum low-water flow of 317 cubic feet per second, or a maximum flow of approximately 4,200 cubic feet per second under exceptionally favourable high-water conditions. This storage area may, however, be increased by the erection of a dam of such a height (maximum height being under 50 feet) as would provide storage for the whole precipitation run-off from the entire catchment-basin, and the flow could be so regulated from the reservoir as to permit of a continuous discharge of 550 cubic feet per second.

"*Dam-site.*—This site is in Ain River at the first falls, about 200 feet from the entrance to the lake. The channel at this point contracts between rock walls and is about 36 feet wide at low water. The bed of the river is also of rock, all basaltic in character. The wall on the east side rises to a height of 50 feet in a horizontal distance of 60 feet; on the west side to a height of 50 feet in a horizontal distance of 80 feet, with in places a surface covering of several feet of moss and earth.

"*Mill-site.*—To procure a suitable mill-site at tide-water where freight and other boats could make a landing it would be necessary to go about three-quarters of a mile from the river's mouth, as a long sand-bar extends past the entrance to the river and in front of the Indian reserve, rendering navigation there impossible, except to small boats. The nearest site of this description obtainable is near the south-east corner of Lot 1437. From here a narrow-gauge railway or motor-truck road-bed could be built on a direct line to the West Fork of the river, from which point there would be a heavy grade to overcome, which might the easier be accomplished if the course from here on followed the windings of the river.

"If such a railway were built in order to take in the materials necessary for building a dam, a great part of its cost might be defrayed by bringing out such spruce and other millable timber as might be in proximity to such railway.

"*Power.*—Considering the available head as 124 feet and the continuous flow under reservoir government 550 cubic feet per second, the available horse-power is 6,200 (using an efficiency factor of 80 per cent.).

"AWUN RIVER.

"*Source.*—Awun River is the outlet of Awun Lake and flows north into Awun Bay near the western end of Masset Inlet.

"*Characteristics.*—The river is about one mile in length from the lake to a point where it meets the high tides from the inlet; from this point to the mouth is about a quarter of a mile, or in all a total length of a mile and a quarter. The banks in general are sloping, but in many cases rise abruptly to a height of 10 or 15 feet. The channel has a well-defined low-water bed, but there is every evidence that it has cut for itself auxiliary channels during flood stages.

"The average velocity of the low-water flow is about a mile and a third per hour as found by timing floats in a representative reach of the stream, the average width about 30 feet, and

the average central depth 1¼ feet. Two falls occur, one of about 5 feet at a point about two-thirds of the distance up the river from tide-water; the other about 2½ feet at the point chosen for a dam-site.

"*Volume.*—Gaugings gave a mean of 60 cubic feet per second, which might be considered as slightly more than the low-water discharge. This discharge would not seem to be very constant, as the mountains surrounding the lake rise with a steep incline and in many places are partly denuded of vegetation through the action of slides. The influence of precipitation would therefore be felt quickly and the flow of the river on that account be rendered irregular.

"*Drainage Area.*—The drainage area comprises nearly twenty square miles, of a rugged mountainous character, showing frequent rock-outcrops, but heavily timbered on the lower slopes.

"The precipitation here is assumed to be equal to that of the Ian Lake neighbourhood and taken as 60 inches. Therefore, with an annual precipitation of 60 inches and a drainage area of twenty square miles, there will be a total annual precipitation of 64,000 acre-feet, and allowing loss by evaporation to be 14 per cent. and from other causes 6 per cent., there is available 52,200 acre-feet, or sufficient to produce a continuous flow of 72 cubic feet per second.

"*Levels.*—The elevation of Awun Lake above high-tide levels of Masset Inlet is 48 feet.

"*Power.*—Considering the available head at the dam to be 47 feet and the continuous flow under reservoir control to be 72 cubic feet per second, the available horse-power is 308 (using an efficiency factor of 80 per cent.). The low-water horse-power without reservoir conditions is 256.

"*Storage.*—The natural storage-basin of Awun Lake is slightly in excess of two square miles and will yield a low-water flow of nearly 60 cubic feet per second, which may easily be increased to the maximum of 72 cubic feet per second by the erection of a dam (of a maximum height of 20 feet).

"*Dam-site.*—Several dam-sites are available near the lake, but the one deemed the most suitable is at a point about 600 feet from the lake; here the drainage area divide crosses the river, sloping to the north and west respectively. At this point the river-bed is about 30 feet wide, with a fall over rock of about 2½ feet. The banks on the east side rise on a 1-to-1 slope to about 60 feet; showing frequent rock-outcrops. On the west the slope is more gradual and the banks rise to a greater height, with a considerable thickness of earth over the underlying rock.

"*Mill-site.*—A suitable mill-site could be had at the mouth of the river on the west bank; at low tide the water here is shallow and would necessitate a wharf, exceeding perhaps 600 feet in length to reach the deep water. The bay, however, is sheltered and affords a safe anchorage for small boats.

"*Power.*—The low-water flow of the river is in the neighbourhood of 60 cubic feet per second, and (using an efficiency factor of 80 per cent.) would provide 256 horse-power; but with storage facilities this could be increased to 72 cubic feet per second or 308 horse-power.

"The prospects here throughout seem more suited for a cannery than for any other industrial enterprise.

"MAYER LAKE.

"Mayer Lake is situated about five miles and a half east of Port Clements, Masset Inlet. It lies almost due north and south and is about seven miles and a half long with a greatest width of half a mile, and, lying as it does in a very shallow depression, does not appear to have a great depth in any part. A stream about 20 feet wide enters at the northern end; this stream

has no perceptible current, being more of a slough in character, and drains from the swampy land lying to the north of the lake.

"The outlet, Mayer River, is at the southern end, but has become blocked by an accumulation of drift, fallen trees, and silt, through which the water filters sluggishly to the more open stream-bed below. On account of these obstructions in the river and because of its very low banks, much of the high-water flow, which would otherwise be carried away by this agency, floods out over the low lands to the south, making travel in those parts difficult and cultivation impracticable.

"*Access to Lake.*—Some years ago a road was laid out from the village of Port Clements to the lake. This road runs through Lots 1883, 414, 412, 411, 391, and from thence follows the northerly boundary-line of Lots 384 and 383 to the lake. It is now seldom used, as the pre-emptors whom it was built to serve have abandoned their holdings; some did so prior to the outbreak of the present war; the others since, most of them enlisting.

"*Elevation.*—The elevation of the lake is 60 feet above high-tide water. This occurs in a distance of about nine miles following the course of Mayer River.

"*Storage.*—No natural facilities for the erecting of a reservoir present themselves here, nor would the head available justify any extensive works with a view to developing power from this source."

WATERWORKS.

ELKO.

The Elko waterworks has now been in operation some years, but owing to the town not developing as expected the revenue from the water system under the then existing rates was not enough to meet the operating expenses and the liability against the system. Through the services of the Department a new tariff was established and new officers placed in charge.

NAKUSP.

An attempt is being made to provide a water service to the residents and farmers in the vicinity of Nakusp. Early in the year a preliminary report was made by our District Engineer's office at Nelson as to the practicability and feasibility of the proposed scheme. This report outlined the possibility of providing a water service to eighty-nine taps at a cost of $26,000; allowing for repayment of the capital, depreciation, maintenance, and operation, it would be necessary to charge about $50 per annum for each tap. In view of the scattered positions of the residences, the length of pipe-line between each connection is large and greatly adds to the cost of the scheme. Even if the cost were $75 per annum for each connection it would not be excessive under the circumstances.

SIDNEY.

A reconnaissance survey was made by G. Anderson, M.Inst.C.E., during the season to determine whether it was advisable to make detail surveys as to the augmentation of the water-supply to the Sidney water system. The report discloses that there are some small reservoir-sites available, but it would appear that the cost of utilizing same might be excessive in view of the long distance the water would have to be carried before it could be made available in the existing water system.

WELL-DRILLING.

Well-drilling has again been carried on at two places in the Province during the past year—in the Hazelton Water District near Kitwanga, on the Grand Trunk Pacific Railway, about twenty-five miles west of Hazelton, and at Marysville, in the Cranbrook Water District. As stated in the last annual report, the difficulties encountered in drilling have prevented rapid progress with the operations.

Kitwanga, Prince Rupert District.

This well has been sunk on the first bench on the north side of the Skeena River, at an elevation of 104 feet above the river and 525 feet above sea-level. Owing to the difficulty of getting an experienced driller and also to the difficulty of getting well-casing, it was late in the year before operations commenced. The report of H. C. Fritts, the driller, is as follows:—

"On October 16th drilling operations were commenced and it was found that soft blue clay and sand had filled up 30 feet in the 6-inch pipe. The 6-inch pipe was then driven 3 feet in an endeavour to shut off this caving; this was not successful, and owing to the lateness of the season 4-inch pipe was used, as more rapid time could be made in drilling. At a depth of 309 feet the 4-inch pipe had shut off the caving, and I drilled past the 4-inch pipe to a depth of 350 feet in hard blue clay, where a strata of coarse grey sand was encountered that filled up in the 4-inch pipe to 253 feet from the surface. This sand, I believe, contains a sufficient amount of water for farm use, but is held back by the volume of sand in the 4-inch pipe. At this time drilling operations were discontinued owing to the number of deaths and sickness in vicinity; only for this and the lateness of the year in getting started the well would have been finished this year.

"In continuing the well, I would advise that a 20-foot length of 4-inch galvanized pipe, perforated and wrapped with fine galvanized wire screen and wire, soldered, be used in the bottom of the 4-inch pipe, and that the 6-inch pipe be drawn; also that proper equipment and tools be purchased for drawing 4-inch and 6-inch pipe, which can again be used in different wells at considerably less expense to the farmer and the Government."

The work this season demonstrated that water was available and that very little requires to be done to finish off the well.

Marysville, East Kootenay.

The operations at this point suffered considerably through the inexperience of the drillers. It is impossible to make much progress without thoroughly experienced men, and this season's work at this point more than fully bore out this contention.

DRAINAGE.

Kootenay Flats.

In order to make a closer study of the regimen of the Kootenay River it was necessary to undertake certain surveys during the season. E. P. McKie, A.M.E.I.C., was detailed to undertake this work, and his report on the work done is as follows:—

"The party consisted of two chainmen, a launch engineer, and myself. We left Nelson by launch on September 28th and arrived at Kootenay Landing on Sunday, September 29th; then proceeded about three miles up the river and fixed our first camp.

"A decision was arrived at to take a few soundings at the mouth of the river and soundings across the river at every mile. The distance of Kootenay Landing from the International Boundary at Porthill is about twenty-eight miles, but the least distance that would have to be levelled, including check-levels, cross-sections, and tieing into Dominion bench-marks, is about seventy miles.

"The method of procedure was as follows: The mile points were fixed from positions shown on the plan from what land-marks were available. A tag-line was prepared by using a ⅝-inch Manila rope and inserting tags at every 20 feet. The launch engineer and a chainman then drove in long plugs at the water-level on each bank, marking the water-level with a nail; the tag-line was stretched across the river by means of block and tackle, and the men read the depth of soundings at each tag by means of a light steel sounding-cable. After taking a sounding a trail was cut through the brush on the river-bank to the open flats, the depth of the brush varying from 100 feet to 600 feet. When soundings had been taken at three or four sections the cross-sections were completed by levels tied into the bench-marks. At Mile 18 a line of check-levels was run to Creston.

"The work proceeded in this manner until Porthill was reached on November 19th and the levels tied into the Dominion levels at the International Boundary. Owing to wet weather only about one-half of the time was available for work, and the freeze-up came the day after finishing.

"There is evidently very little difference between the elevation of the water-surface at low water at Porthill and at the lake; this is very important and should be checked, and more time should be available to run the levels than there was last fall."

GLEN LAKE, NEAR COLWOOD, V.I.

The drainage of certain lands in the vicinity of Colwood necessitated investigations as to the possibility of relieving these lands of their excess waters. E. G. Marriott, A.M.E.I.C., has made a short study of this problem, but before coming to any definite conclusion it will be necessary to do a certain amount of levelling. When this is undertaken it will be probable that a drainage district will be incorporated to undertake this work on a proper scale.

DATUM-PLANES.

The establishing of definite figures correlating the various datums in use on the Lower Mainland has made further progress, and we are indebted to A. J. Dalzell, of the City Engineer's Office, Vancouver, for the final figures relating to this important subject. The table given herewith has been submitted to Dr. Dawson at Ottawa for confirmation and may now be taken as correct:—

British Columbia Mainland Datum-planes.

Datum-planes referred to Vancouver Harbour Tide-levels.	O.L.W.		M.S.L.		H.W.L.

METEOROLOGICAL REPORT, 1917-18.

Work during the year has been continuous along the lines adopted formerly. The co-operation between the Dominion Meteorological Service and the Provincial Water Rights Branch, which was begun in 1915, has been continued throughout the year. As the result of this, records are now available from 245 stations, of which 160 are Dominion stations.

Complete returns have been received from 165 stations during the year. At 129 stations the precipitation was greater and at twenty-eight it was less than during 1916-17. The records show increases at ninety-three stations and decreases at sixty-eight, compared with the average for same for all years up to and including 1917-18. For all stations maintained ten years and upwards the records show increases at thirty-two and decreases at eight, compared with average for same up to and including 1917-18.

During the year seven minimum and twenty-seven maximum records were established at the stations indicated by *.

Maximum Records.—A new maximum yearly record has been established for all stations by the 301.16 inches registered during the year at Swanson Bay, where the previous highest yearly record for any station was established in 1907-8, when 205.58 inches was registered.

At Lake Buntzen Station, which has been maintained for fifteen years, the precipitation was 123.96 inches, thus establishing a new maximum record for this station. This is the only station out of all the stations maintained for ten years and upwards where a new record was established; the previous maximum record for this station was 123.32 inches in 1904-5.

Monthly maximum records were also established at this station as follows: 88 inches in November, 1917; 146 inches from October 1st to November 30th, 1917; and 206.34 inches in the four months ending January 31st, 1918.

Minimum Records.—With a precipitation of 5.28 inches, Ashcroft has the lowest record for the year. Further, by months, it has also established monthly records as follows: March 1st to April 30th, 0.001 inch; February 1st to April 30th, 0.20 inch; six months ending July 31st, 2.21 inches; and for the eight months ending September 30th, 2.49 inches.

Additional Data.—Particulars of economic value regarding precipitation which have an important bearing on all water-development questions are now given for the first time as follows:—

(*a.*) The annual precipitation table, giving the usual yearly data, has been extended and includes particulars of approximate elevations of 133 stations above mean sea-level. Also maximum and minimum yearly records established for all stations since they have been maintained.

(*b.*) A new table, giving some selected lowest precipitation records, which have been established for long periods at the various stations mentioned.

The tables herewith are compiled from all sources available and for all stations, whether maintained at present or not.

The two years given under records established refer to the water or climatic year, which extends from October 1st to September 30th.

In making use of these tables for average precipitation, reserve should be placed on the figures for a period of less than ten years.

Owing to the war it has been difficult to keep the records unbroken, and although the data for some months are missing, as a whole the Department has to thank the numerous observers for their thought and care during the past season.

APPENDICES TO WATER REPORT.

APPENDIX No. 1.

WATER POWERS OF BRITISH COLUMBIA.

In preparing the list a careful analysis was made of all water records, licences, engineers' and surveyors' reports, and 457 sites were indexed. In many instances, however, the information available was scanty and insufficient to check the amount of power given. In the list, wherever the figures are uncertain, note is made under the "Remarks" column.

The 270 power-sites given are divided under the following heads:—

Wholly or partially developed	30
Sites applied for	93
Sites known and unstaked	147

With regard to those power-sites located by the Commission of Conservation, the figures must for the present be taken with reserve. A. V. White, of the Commission, intimates that it is unnecessary to emphasize the paucity of the hydrographic information existent for the northerly part of the Province. With respect to the estimates given, while these were based on such data as were available, it is clear that without explanation the quantities mentioned might be misleading. When the report on the "Water-powers of British Columbia" is published, in connection with the tabular material relating to horse-power, there will be explanatory notes and comments, also description governing the use of the tables.

WATER-POWERS OF 500 HORSE-POWER AND OVER.

APPENDIX No. 2.

HOW TO ACQUIRE A "CLASS A" OR "CLASS B" LICENCE TO TAKE AND USE WATER.

The Province has been divided into thirty-one "Water Recording Districts," the boundaries of which follow as nearly as possible the main watersheds, and a "Local Recorder," in most cases the Government Agent, appointed for each district. The Local Recorder acts as a "Recorder," the active administration in the more important districts being in the hands of a "District Engineer," whose duties are defined by the "Water Act, 1914," and who is subject to the Comptroller of Water Rights, whose office is at Victoria, B.C., and in whom alone is vested the power to approve an application and grant a licence. The printed forms of notice, application, etc., may be obtained on application to the office of any Water Recorder, District Engineer, or to the Comptroller's office.

Licences may be granted for the use of water for any of the following purposes: Domestic, waterworks, mineral-trading, irrigation, mining, steam, fluming, hydraulicking, industrial, power, clearing-streams, storage, conveying, and lowering-water.

As the water may be required in varying quantities, the applications have been classified as follows: "Class A," "Class B," and "Class C," the definitions of these classes being as follows:—

"Class A," in reference to any application or licence, means any application or licence for "domestic," "mineral-trading," or "steam purpose"; or for "mining" or "industrial purpose" where the water is to be used in quantities not exceeding 100,000 gallons per day; or for "irrigation purpose" where the acreage to be irrigated does not exceed 640 acres; or for "power purpose" where the power to be developed does not exceed 100 horse-power and is to be used by the applicant only: Provided that, if in the opinion of the Comptroller the nature of the works intended is such as to require the submission of detail plans, he may place any application which might come within the foregoing classification into "Class B" notwithstanding the foregoing limitations:

"Class B," in reference to any application or licence, means an application or licence for "mining" or "industrial purpose" where the water is to be used in quantities exceeding 100,000 gallons per day; for "irrigation purpose" where the acreage to be irrigated exceeds 640 acres; or for "storage purpose" or "hydraulicking purpose" or "clearing-streams purpose" or "fluming purpose" where the water is to be used by the applicant only; or for "power purpose" where the power to be developed exceeds 100 horse-power and is to be used by the applicant only; or for "lowering-water purpose": Provided that, if in the opinion of the Comptroller the nature of the works is such as not to require the submission of detail plans, he may place any application or licence which might come within the above classification into "Class A" notwithstanding the foregoing limitations:

"Class C," in reference to any application or licence, means a licence by virtue of which water is held in gross, whether by special Statute or otherwise; or an application or licence for "power," "hydraulicking," "clearing-streams," or "fluming purposes" where tolls are to be charged; or for "waterworks" or "conveying purposes."

A licence in respect of a "Class A" or "Class B" application can be obtained by an "owner," "owner" being defined by the Act as:—

(*a.*) Any registered owner in the book of indefeasible or absolute fees in any Land Registry Office in the Province:

(*b.*) Any purchaser or lessee in a registered agreement for purchase or lease:

(*c.*) Any applicant to register his title as owner or his agreement for purchase or lease:

(*d.*) Any pre-emptor, homesteader, or purchaser from the Crown in the right of either the Dominion or the Province, or any applicant to so pre-empt, homestead, or purchase:

(*e.*) Any timber licensee or lessee:

(*f.*) Any other lawful occupant of land or of a mine:

(*g.*) Any legal representative of an owner (as herein defined) who has died, become insolvent, is a minor, is of unsound mind, or is otherwise under disability:

(*h.*) Any receiver or liquidator of a company which is the owner (as herein defined) of land.

A licence in respect of a "Class C" application can only be acquired by a municipality empowered by an Act of the Legislature or to a company authorized by its memorandum of association or by some Act of the Legislature to acquire such licence, and in no case until the undertaking has been approved under the "Water Act, 1914."

The initial procedure to obtain a "Class A" or "Class B" water licence is as follows:—

(1.) Post notices at or near the point of diversion and place of use:

(2.) File the notice in duplicate in the office of the Water Recorder for the district in which the proposed point of diversion is situate:

(3.) At the same time as filing serve the notice upon each owner whose land will be touched or in any way affected by the proposed works:

(4.) Forthwith after posting on the ground, advertise the notice in a local newspaper once a week for four weeks:

(5.) Within ten days after the date of the first publication, file the formal application in duplicate in the Water Recorder's office.

The following is a more detailed summary of the procedure of the requirements of the "Water Act":—

First Step—Posting Notices.

The applicant shall post on the ground at conspicuous points near the proposed point of diversion and proposed place of use a notice of his intention to apply for a licence; although printed forms are supplied, the Act does not require that the notice follow any particular form, but it must give the following particulars:—

(*a.*) The name and address of the applicant:

(*b.*) The Water Recorder's office in which the application is to be filed:

(*c.*) The name or a clear description of the stream the water of which is to be diverted or used:

(*d.*) The quantity of water applied for in acre-feet per annum, cubic feet per second, gallons per day, or miners' inches:

(*e.*) The proposed point or points of diversion:

(*f.*) The purpose for which the water is to be used:

(*g.*) The number of the lot or section (and, if subdivided, the number or description of the subdivision) of the land or mine, and, if a mine, the name of the mine, upon which land or mine the water or power is to be used:

(*h.*) The date when the notice was posted on the ground.

Second Step—Filing and serving Copies of the Notice.

Forthwith after the posting of the notice on the ground as above, notices to the same effect shall be filed in the office of the Water Recorder for the district in which the proposed point of diversion is situate, and served upon each owner whose land will be touched or in any way affected by the proposed works. Proof of this service is required.

Third Step—Advertisement.

A notice giving all the particulars mentioned above, and, in addition, the date of the first publication and stating that objections may be filed with the Comptroller or with the Water Recorder within thirty days from such date, shall forthwith be published once a week for four weeks in a newspaper published in each district affected.

Fourth Step—The Application.

Within ten days from the first appearance of the notice in the local paper, the application, on forms to be supplied, must be filed in duplicate in the office of the Water Recorder where the notice was filed. The sketch on the application form need not be to scale, but must show the point of diversion, the lands crossed or affected, and generally outlining the scheme. The Local Recorder then forwards the application to the Comptroller, who checks the application and advises the applicant of the further requirements and of the amount of fees payable.

FIFTH AND SIXTH STEPS—ADDITIONAL INFORMATION AND FEES.

The further information and the fees must be filed with the Comptroller within fifty days from the first appearance of the notice in the local paper. The fees to be paid in respect of a licence for irrigation purposes are 5 cents per acre-foot of water applied for, and the annual rental is 2 cents per acre-foot of water granted by the licence.

Conditional Licence.—The Comptroller is now in a position to consider the application for the licence. If a "Class A" application, he may issue a conditional licence wherein he sets a time for the commencement and completion of the works and authorizes the use of the water.

SEVENTH STEP—(CLASS "B" APPLICANTS ONLY).

If a "Class B" application, he may issue an authorization to the applicant to proceed to survey and file plans and specifications of his proposed works, setting the time within which they must be completed and the manner in which they are to be made. These plans and specifications are to be submitted in triplicate, one set of plans being tracings and two sets prints, and must be in such detail that the construction of the works could be carried out from them.

EIGHTH STEP—THE TAKING OF LANDS.

Should the applicant require a right-of-way over Crown or private lands, the following procedure must be followed:—

Provincial Crown Lands.—Address a petition and sketch to the Minister of Lands, but file same with the Comptroller of Water Rights, showing:—

(1.) The number and principal terms of the conditional licence:

(2.) The nature of the easement required:

(3.) The length, breadth, and area of the right-of-way and its location.

Dominion Crown Lands.—Address a petition and sketch to the Minister of the Interior, but file same with the Comptroller of Water Rights, showing and setting out the same details as above.

Private Lands.—Obtain if possible the written consent of the owner of the lands over which a right-of-way is desired. If this is withheld it will be necessary for the applicant to furnish security to the amount set by the Comptroller, after which the Comptroller may give the applicant authority to enter on the lands to be used. Following this latter procedure, it is necessary for the applicant to take all steps necessary, as set out in the "Water Act," for the determination, by arbitration, of the amount which is to be paid by way of compensation for the land which is used.

NINTH STEP—FILING PROOF OF COMPLETION.

Within sixty days of the date set for the completion of the works, the licensee shall file proof of such completion, and the Comptroller, when he has satisfied himself by inspection or otherwise that the work has been carried out in a satisfactory manner, will issue a final licence.

While the above is an outline of the procedure to obtain a licence for the use of water, for full particulars of the rights and obligations of licensees interested parties are referred to the "Water Act, 1914," and the rules and regulations thereunder, copies of which, as well as detailed information and forms, may be obtained from the Comptroller of Water Rights, Victoria, B.C.

APPENDIX No. 3.

THE MEASUREMENT OF WATER.

The object in view in the administration of the water of British Columbia is to make the greatest beneficial use of the water, and in order to obtain this end the measurement of the water is of the greatest importance.

On most of the rivers of any size, and on many smaller streams, the measuring of the discharge is in the hands of expert engineers assisted by local observers, but the large body of the work necessary to obtain the greatest beneficial use must be done by the users themselves.

In most cases it is of advantage to know how much water there is, and how much any one is taking, as this leads to a great deal less trouble and friction where the water-supply is limited; it is also admitted that no one can really make a success of irrigation or utilize the important results made public in the reports of Government experimental work unless they know and can control the amounts of water used for different crops. It is hoped that the rather haphazard arrangements adopted by many irrigators will give place to more careful and studied methods.

It should be noted that by the "Water Act, 1914," 1 cubic foot per second (c.f.s.) is fixed as being equal to 1.98 acre-feet per twenty-four hours, so that 1 c.f.s. will approximately cover 1 acre to a depth of 1 inch in 1 hour; this forms an easy basis for calculation, and is used in the table in Appendix 7, which shows the acre-feet given by various discharges in cubic feet per second over a certain time.

The three main measuring-devices for small amounts of water are the "V" notch, the rectangular weir, and the Cippoletti weir. The "V" notch is useful only with very small amounts; the rectangular weir offers certain difficulties in calculation; but the Cippoletti weir overcomes these, it is simple to measure with, and is therefore adopted as being most suitable for the purpose in view.

How to make and place a Cippoletti Weir.

There are certain fundamental features in the construction and use of a Cippoletti weir that must be understood in order to obtain satisfactory results. It must be made correctly, placed correctly, and kept in good order.

Reference to the illustration will show that the sides of the opening are sloped 1 to 4; that is, for every 4 inches above the crest 1 inch is set off to the right or left.

The weir should be bevelled to a sharp edge on the up-stream face, so that the water passes freely over it and allows room for a small amount of air between the discharged water and the weir; sometimes a sheet of metal is used, and the weir cut out of that, or the wooden edge may be covered by a metal strip to prevent its being damaged and so losing its shape.

The following points should be carefully observed:—

(1.) The weir should be set at right angles to the stream, should be perpendicular, and the crest exactly horizontal.

(2.) The width from the edge of the slope to the bank should not be less than three times the depth of water flowing over the crest, so that if the weir is designed for a maximum discharge of 12 inches of water, there should be at least 3 feet clear to the bank each side.

(3.) The depth of water below the crest on the up-stream side should also be at least three times the depth of water passing over the crest, and arrangements should be made by a sluice-gate or otherwise to keep this depth clear.

(4.) There must be a free fall on the down-stream side.

(5.) It is important that as far as possible the water should approach the weir slowly, and without eddies or cross-currents. To obtain this, the weir should be placed in a straight length of channel where possible, and at such a height that a considerable pool is formed behind it.

How to measure the Discharge.

It will be noticed that where the water passes over the crest there is a slight curve in the upper surface, so to measure the correct depth it is necessary to place a peg from 6 to 10 feet from the weir, with the top exactly level with the crest, and to measure the water from the top of the peg; this depth is also called the head of water.

On referring to the table given, the head expressed in inches is shown on the left hand, and opposite this is given the discharge over a 1-foot weir. The discharge varies directly as the width of the crest, so for a 5-foot weir the figure given would be multiplied by 5, and similarly in any other case.

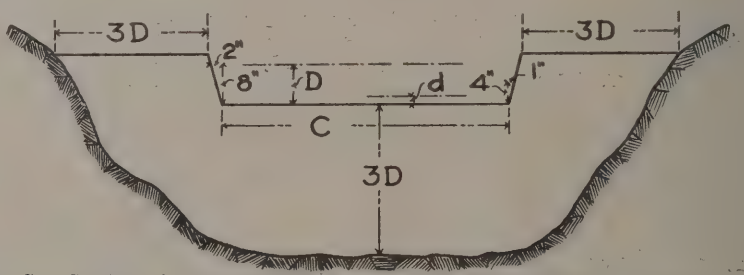
What Size to make the Weir.

To obtain good results from the use of Cippoletti weirs it is also necessary to keep the depth of water flowing over the weir within certain limits; this is obtained by varying the width to suit the particular requirements in each case. The depth of water should not be less than 2 inches, nor more than one-third of the length of crest; so within these limits a—

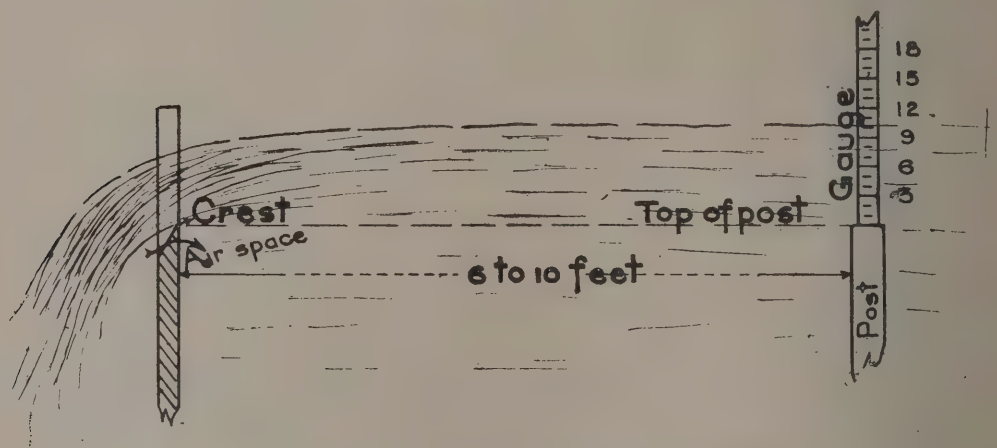
1-foot weir can be used for discharges from ¼ to 1 c.f.s.
2-foot weir can be used for discharges from ½ to 3½ c.f.s.
3-foot weir can be used for discharges from ¾ to 10 c.f.c.
4-foot weir can be used for discharges from 1 to 20 c.f.s.
5-foot weir can be used for discharges from 1¼ to 35 c.f.s.
6-foot weir can be used for discharges from 1½ to 55 c.f.s.
7-foot weir can be used for discharges from 1¾ to 80 c.f.s.
8-foot weir can be used for discharges from 2 to 115 c.f.s.
9-foot weir can be used for discharges from 2¼ to 155 c.f.s.
10-foot weir (with 2 to 36 inches depth of water) can be used for discharges from 2½ to 175 c.f.s.
15-foot weir (with 2 to 36 inches depth of water) can be used for discharges from 3½ to 260 c.f.s.
20-foot weir (with 2 to 36 inches depth of water) can be used for discharges from 4¾ to 350 c.f.s.

It will be seen there may be a considerable choice as to size, but it is best to select the one that will give the most correct measurements at the lowest discharge. The width of the watercourse and the grade will also influence the size of weir-crest.

Any inquiries as to the width most suitable in any particular case should be addressed to the Comptroller of Water Rights, giving full particulars as to width of channel, height and nature of banks, grade of watercourse, and the range of discharge required to be measured.



Cippoletti weir. C = Crest, or length of weir. D = Maximum depth of water on crest = one-third length of crest, but not more than 3 feet. d = Minimum depth of water on crest = 2 inches.



Cippoletti weir. C = Crest, or length of weir. D =

Table of Discharges in Cubic Feet per Second over a Cippoletti Weir One Foot wide.

APPENDIX No. 4.

GRIZZLY BAR, OR SELF-CLEANING INTAKE AND DIVERSION.

Specification.—The box, which should be constructed of not less than 2-inch lumber, to be set in a trench cut across the creek, the top of box being flush with creek-bed. Box to be 2 feet wide by 1 foot 6 inches deep at shallow end, sloping to 2 feet deep where it terminates at the sluice-gate, at the connection to the flume. The length to be determined by local conditions, but should be only sufficiently long so that the sluice-gate and flume thereto can be conveniently located. Wing-boards and aprons of substantial size, depending on the particular site where the box is installed, to be provided, great care being exercised that the foot-steps are sunk sufficiently deep to avoid the possibility of the water getting underneath the box.

Grizzly bars to be fixed across top of box, the sides of the box being so shaped that the bars in the centre of the stream will be lower than those at the side. The middle 3 feet of bars to be sunk 1 inch lower than the sides in order that two pieces of ⅛-inch sheet iron or steel, each 2 feet by 1 foot 6 inches, may be set therein. These plates to be set prior to the spring floods, so that the greater quantity of water and gravel passing down the creek may be carried over the box and so prevent it choking.

A sluice-gate to be provided and fixed on the side of the lower end of the box, in order that all gravel and sand may be automatically discharged through a flume to the creek at a point below the grizzly bars.

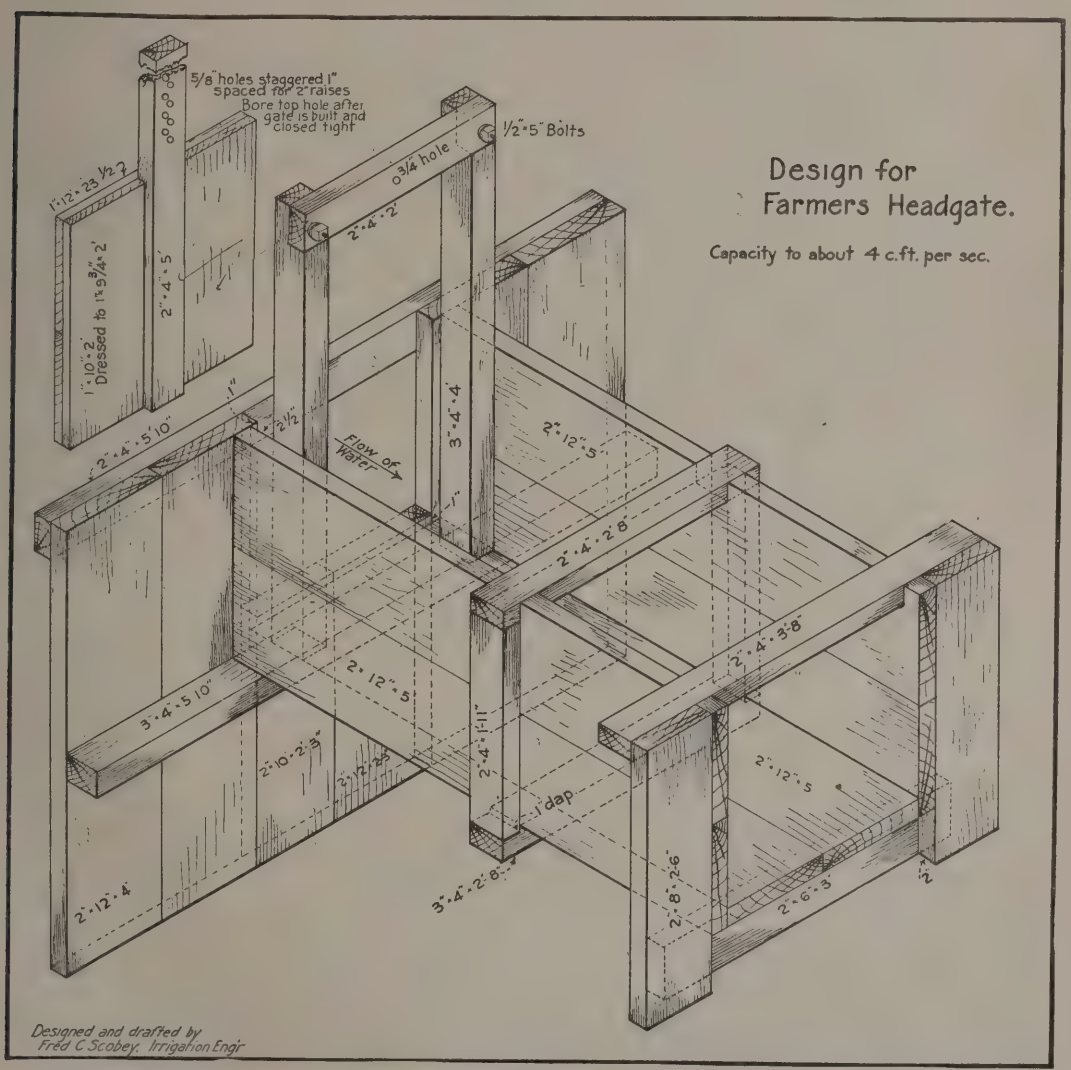
APPENDIX No. 5.

IRRIGATION HEADGATES.

Farmer's Headgate.

The farmer's small headgate shown in Fig. 1 will deliver up to 4 second-feet in the ditch below under favourable conditions of grade and size, assuming the gate-box can be kept full of water.

It will be noticed that the two inner planks of the front wings extend 1 inch beyond the inner face of the side-walls, thus forming front guides. The extension of the two planks in the front cut-off wall above the floor-boards by an inch makes a tighter gate; the gate fits down behind them.



Design for
Farmers Headgate.
Capacity to about 4 c.ft. per sec.
5/8" holes staggered 1" spaced for 2" raises
Bore top hole after gate is built and closed tight
1/2"x5" Bolts
0 3/4 hole
Flow of Water
1" dap
Designed and drafted by
Fred C Scobey, Irrigation Engr

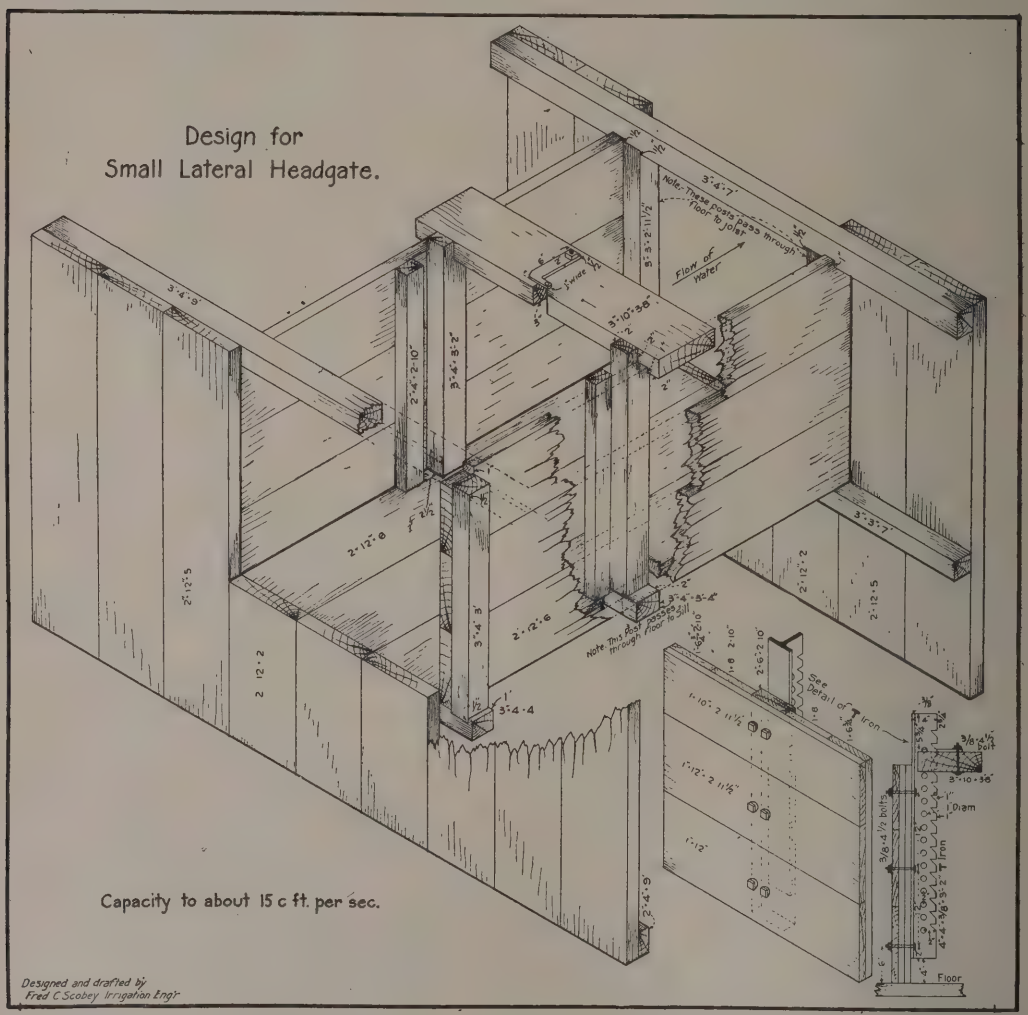
If possible, the stem of the gate should be hardwood and the holes bored therein staggered as shown; 5/8-inch holes will take a 1/2-inch pin, which could have an iron ring at one end and a small slot at the other to receive the tongue of a thin padlock.

The dimensions of lumber are suited to a structure of the size indicated; a considerable increase in size would need other dimensions and a rearrangement of struts and braces.

The depth of the wing and front walls must be determined by the nature of the soil; one of sand would require greater depth than those shown. Whatever depth be decided on, the dirt excavated must be well puddled round the walls, thoroughly tamped down with a rammer, previously having been worked to the consistency of stiff mortar. If the dirt be replaced in a dry state, carelessly shovelled in, there is every likelihood of a washout.

SMALL LATERAL HEADGATE.

The small lateral headgate shown in Fig. 2 is 3 feet high and 3 feet wide, with a capacity of about 15 second-feet under favourable conditions.



Design for
Small Lateral Headgate.
Capacity to about 15 c ft. per sec.
Designed and drafted by
Fred C Scobey Irrigation Engr

Should it be preferred, angle-iron can be used instead of a T-iron as a stem; it costs less. The gate is raised by means of a short crowbar inserted in the notches and used as a lever.

The same care should be taken to carefully install this type of gate as the farmer's small headgate; if necessary, the vertical planks of the wing-wall can be driven down with a wooden mallet, and cut to length after.

Timber should be notched and fitted as shown in the drawings; whilst this entails slightly more labour at the time, it adds a great deal to the strength and stiffness of the structures.

Bills of material for both types of gates are appended; the lateral type has quantities for three sizes.

Farmer's Headgate. Capacity up to about 4 Second-feet (depending on Grade and Condition of the Ditch below the Gate).

Bill of Lumber.

Use.	Pieces.	Dimensions.	Feet, B.M.

T-iron—One piece 4″ x 4″ x ⅜″ x 4′ 2″, bored as per detail (for additional foot).
Bolts—Seven ⅜″ x 4½″, with washers for each end.

APPENDIX No. 6.

OVERIRRIGATION.

Overirrigation:—

(1.) Causes smaller crop yields per unit of water:
(2.) Encourages water-logging and alkali trouble on heavy or low-lying land:
(3.) Leaches out plant-food from coarse soils:
(4.) Causes more plant-food to be used by the plant for each pound of crop produced:
(5.) Causes the quality of crops to be reduced:
(6.) Produces straw at the expense of grain:
(7.) Deprives other lands of irrigation-water:
(8.) Soil air is excluded and unfavourably low soil temperatures are caused by excessive irrigation:
(9.) The community spirit is lower wherever water is wastefully used:
(10.) Overirrigation is the greatest menace to permanently profitable irrigation agriculture:

Proper irrigation makes it possible to build up and keep the soil in a higher state of fertility than is possible by other types of farming.

APPENDIX No. 7.

USEFUL DATA.

1 mile = 1,760 yards = 5,280 feet = 80 chains.
1 chain = 100 links = 66 feet = 4 rods.
1 square mile = 640 acres.
1 acre = 43,560 square feet = 10 square chains.
1 acre equals approximately a square 209 x 209 feet.
1 foot per second = 0.68 mile per hour.
1 mile per hour = 1.467 feet per second.

WATER UNITS.

1 cubic foot of water = 6.23 gallons.
1 cubic foot of water weighs 62.4 lb.
1 cubic foot per second = 6.23 gallons per second.
= 373.9 gallons per minute.
= 538,453 gallons per day of 24 hours.
= 35.71 B.C. miners' inches.
= 1.98 acre-feet per day of 24 hours.
1 miner's inch = 0.028 cubic foot per second.
= 10.47 gallons per minute.
= 15,076.8 gallons per day.
= 0.0555 acre-foot per day.
= 1 acre-foot in 18 days of 24 hours.
1 acre-foot = 43,560 cubic feet.
= 271,472 gallons.
= 1 cubic foot per second for 12.12 hours.
= 1 miner's inch for 432.86 hours.
1 gallon = 277.274 cubic inches.
= 0.16046 cubic foot.
= 1.2 U.S. gallons.
= 10 lb.
1,000,000 gallons = 160,460 cubic feet.
= 3.68 acre-feet.
= 1.86 cubic feet per second for 1 day.
= 66.3 miners' inches for 1 day.
1 horse-power = 550 foot-pounds per second.
= 1 cubic foot of water falling 8.8 feet in 1 second.
= 746 watts.
= 0.746 kilowatt.

To calculate horse-power at 70 per cent. efficiency, multiply the amount of flow of water expressed in cubic feet per second by the available head in feet by the factor 0.08.

To convert head in feet into pounds pressure per square inch, multiply by 0.434.

To convert pounds pressure per square inch into head in feet, multiply by 2.31.

DUTY OF WATER.

From 1 to 3 acre-feet of water, depending upon the kind of crop and the rainfall in the particular locality, is usually considered sufficient to properly irrigate 1 acre of land. One acre-foot of water properly distributed over an acre of land is equal to 12 inches of rainfall.

The majority of water licences in the Dry Belt of British Columbia, where the precipitation is less than 20 inches per annum, allow the use of 2½ acre-feet of water to each acre of land.

From 3 to 5 acre-inches is generally considered sufficient for each irrigation, depending on the kind of crops and the method employed in irrigating. This would allow (when using 2½ acre-feet per acre) six to ten irrigations during the season.

Note.—The gallons referred to above are Imperial gallons. Care should be taken when figuring on pump capacities to note whether Imperial or U.S. gallons are referred to, as a U.S. gallon is only 0.833 of an Imperial gallon. The cubic foot per second is the unit of measurement for flowing water, while the acre-foot is used for the measurement of water in bulk, such as capacity of reservoirs, the total quantity of water which may be used during the irrigation season, etc. The miner's inch referred to above *was* the legal unit of measurement in British Columbia prior to the year 1909.

Table showing Acre-feet given by Various Discharges over a Certain Time.

Discharges in Acre-feet for Various Flows for given Time Periods.

FIRST REPORT

OF THE

BOARD OF TAXATION.

To the Honourable John Hart,
Minister of Finance.

SIR,—We, the members of the Board of Taxation, appointed by minute of Council approved by His Honour the Lieutenant-Governor on November 2nd, 1917, under the provisions of the "Board of Taxation Act," beg to report the result of our investigations in the recommendations embodied herein.

It would not be seemly in us, and indeed would be doing a wrong to our feelings, if we did not record at the outset the deep regret we feel and our sense of the loss we suffered in the death of our able and esteemed Chairman, J. B. McKilligan, whose death has removed from the service of the Government a most capable officer, and taken from this Board an unequalled source of knowledge of the history and methods of taxation acquired by him in his many years of service as Surveyor of Taxes in this Province.

His loss made the work of this Board very difficult, the more especially that up to the time of his death the duties of his office as Surveyor of Taxes gave him little time for the work assigned to this Board, and with the exception of performing the duties of Chairman at the meetings held to hear the evidence and pleas of delegations which appeared before the Board on matters concerning them in regard to taxation, the help given us by him was very indefinite and limited in scope; and, as you are aware, no one has been appointed to take his place, and no secretarial help has been asked for by this Board.

On November 5th, 1917, the Board held its first meeting and passed a resolution to fix the time of its meetings—viz., to meet and sit from 10 o'clock a.m. to 5 o'clock p.m. on Mondays, Tuesdays, Wednesdays, Thursdays, Fridays, and from 10 o'clock a.m. to 1 o'clock p.m. on Saturdays. The terms of that resolution have been closely observed, and the transcript of the evidence herewith submitted reveals the time in hearing that evidence. Beyond the evidence therein shown and the privilege afforded us to be present at hearings given by the Executive to representatives of mining and other interests, there has been little added by written documents, as will be shown by the files thereof, herewith also submitted.

Professor Haig, who was present to hear the evidence, acting in the capacity of a special and expert adviser to your Department, worked apart from this Board, and his report, received on March 15th, after the most important conclusions of this Board herein contained had been reached, will be referred to in this report either to show our concurrence with his conclusions where we agree, or our reasons for differing from them where we do not agree therewith.

In addition to the knowledge brought by the members of this Board to the performance of the work imposed upon it by the "Board of Taxation Act," each member, in accordance with the directions laid down therein, has investigated and studied the reports of Tax Commissions and similar bodies in this and other Provinces of the Dominion of Canada, in other parts of the British Empire, in the United States and elsewhere, and in particular such reports from places and countries where new and approved methods of taxation have been introduced, to the extent permitted by the short time given us since our organization.

Before proceeding to review the present economic conditions of this Province, in so far as these relate to and indicate the ability of the different classes of the population to pay taxes, it will be relevant, for the purpose of comparison, to refer to the condition of the Province in 1911 as reflected by the Royal Commission on Taxation in its report dated January 19th, 1912.

On the condition of the Province at the time the Commissioners made their inquiries and took evidence on which to base their report, they were able "to point out that they found abundant proof of rapidly advancing prosperity side by side with a strong spirit of optimism on the part of the people," and "wherever complaints came to the surface it was observable that they were complaints regarding the methods rather than the amount of taxation." This

opinion is emphasized in the summary of that report which proves its deep impression. How far this seeming prosperity and expression of optimism influenced that Commission in reaching its decision is not for this Board to judge, but we wish to say that its very able report, as well as that of the Commission which sat in 1905, has been read and studied with much interest and, we hope, with some advantage to guide us in our work, and we are conscious that the high literary style of both these reports will show this one, by comparison, very defective in that respect.

Without reflecting on the prescience or perspicacity of the members of the Commission of the later date, or of the people whose evidence gave them the impression of the prosperity of the Province and the prevalent spirit of optimism, this Board, in the light of what has taken place since that time, regrets to have to say that the prosperity that seemed so certain then was not of long duration, and that the optimism expressed has been deprived of some of the foundations on which it rested. Time has shown that much of the prosperity which existed at that period did not arise from the production of wealth, which is the true basis and evidence of real prosperity, but arose from the spending of capital. Unfortunately, a very large part of such capital was misdirected or wasted by being invested on a basis of false values or in non-revenue-producing undertakings. And, to add to the misfortune, a large part of the capital so misdirected and wasted was borrowed money.

In less than a year after the date of the report of the Commission of 1911-12 the reaction had begun, as is indicated in a general way by the Royal Commission on Agriculture in 1913. From that time the exodus of the people from this Province was very large up to the time the war broke out, and many more would have gone had they had the means to do so. Luckily, a large number of those who left returned to the Prairie Provinces, whence they came, and so saved their energies, if not their money, for the development of our own country.

The intensity of the depression which followed the false prosperity of the "land boom" increased until the beginning of the war, when patriotism for the Empire, which in many cases was quickened to action by low finances, led most of the men who were physically fit to join the army, thereby, incidentally, relieving the hardships arising from non-employment. This, with the large expenditure of Federal money within the Province for war purposes, which has continued to flow into it ever since, relieved the general business depression and saved it from a probable financial collapse. Concurrently with the "land boom" in this Province there was running a "boom" in the Prairie Provinces also, but unlike ours, in that it was confined mostly to cities and towns. The building resulting from these combined "booms" gave a great impetus to our lumber industry, which reached large proportions in 1913, but which, in sympathy with the collapse of the land speculation, shrank very materially and left little to support the general business of the Province other than the shingle-mills, mining, fishing, and farming industries.

The expenditure by the Federal Government, made necessary by the war, has led to the revival of the lumber industry, which now is in an expanding and prosperous condition, and the output of the metalliferous mines has, under the stimulus of increased prices and unlimited demand created by the war, helped very largely in improving and supporting the commercial life of the community.

How far the abnormal conditions which arose and followed each other in this Province before the war in such a short period of time were the result of the policy of the Government is not a matter for this Board to inquire into, nor to express an opinion upon, but it has evidence to show that many taxpayers are in a position to realize the truth expressed by Dr. Adam Shortt, that "their economic life is being crushed between the millstones of collapsing land-values and rising taxes." But this Board may take this opportunity to say that to it the most inexplicable part of the strange economic phenomena referred to is that no individual or body of men, no financier, no Board of Trade or other body, not even the press or any one else to whom the people might look to for guidance, raised a note of warning during that whole spasm of wild riot of borrowing and spending. On the contrary, some of our big financial institutions and public corporations "set the pace and led the race" in establishing false values.

This being the case, it is no wonder that the wage-earner, the man on the street, and even farmers, who should know better, lost all sense of proportion in respect to land-values.

It is a pity that some one with the wisdom of Dr. Adam Shortt did not have the power to stop all this wild orgy of speculation. Even now there are those amongst us who say that if capital is brought in and spent, no matter how, even if it is wasted, it is a benefit, in spite of

the teaching of our best economists, who show, as experience teaches, that capital squandered or misdirected is harmful, since it directs labour into channels of employment that cannot be permanent and are destructive rather than productive of wealth.

The conditions in the Province when the war broke out may be summarized as follows: Highly inflated real-estate values, heavy indebtedness resulting from reckless borrowing by the Government, municipalities, and private individuals, all of which led to wasteful expenditure and a misdirection of the energies of the people. It is estimated that more than two-thirds of the people were living in cities or the suburbs of cities, most of whom were depending on an increase of real-estate values to recoup their investments and to bring in a revenue to live on. The reaction came and thoroughly demoralized the community commercially and industrially, except in the lines above mentioned. The war relieved the situation, at least temporarily, but the debts remain, and the real-estate values are sought to be maintained by the owners except for purposes of taxation.

This review of the history and present condition of the Province, prompfed by the remarks of the Royal Commission on Taxation in 1911 on its condition at that time, might be amplified and the facts emphasized by quotations from evidence from many sources, and is made for the purpose of showing a basis, and, in some degree, to justify some of the opinions and recommendations herein contained, especially in respect to land-values and the taxation thereof.

This Board, keeping in mind the duties prescribed for it by the "Board of Taxation Act," when investigating the present system of Provincial taxation and the taxation laws of the Province, and comparing these with the principles and methods of taxation in the other Provinces of Canada and other countries, has kept in view, also, the conditions in this Province arising from its *newness*, its resources, the stages of their development, and the distribution and character of its inhabitants, in order to realize the similarities to and differences from the conditions, resources, and population of the various countries with whose systems the taxation of this Province has been compared.

This Board recognizes the fact that comparative "ability to pay," which is the just guide in taxation, may not have the same basis for measurement as between the several classes in different communities. For instance, "ability to pay" in an old, highly organized, and densely populated country will have a different basis for measurement from that of new and sparsely populated ones. In a new country like this, where population is sparse and natural resources still open for appropriation by individuals, and where in consequence there is no circumscribed area out of which it is difficult for the wage-earning class to get, such as exists in old countries, comparative "ability to pay" may indicate the justice of levying a portion of the revenue required by the Government on a lower stratum of economic units of the population than could be justified in the older communities. For, as Adam Smith pointed out in respect to the then American Colonies, cheap land brought cheap food and high wages, and that condition should obtain in this Province under natural development.

When Adam Smith wrote, the Eastern part of this continent was being developed in what may be called the natural way—developing first the agricultural resources and slowly accumulating capital to be applied later on for industrial undertakings. In that period the farmers lived mostly on what they grew on their farms, and, indeed, produced within their own homes most of their clothing and bought very little of commercial goods. The same process of development was taking place on this Coast, as the early history of Oregon will show, when a new and disturbing factor to that process was introduced by the discovery of gold in California and by a similar event in British Columbia about ten years later. This led to a reversal of the order of development which took place on the Eastern side of the continent, for in California agricultural development followed rather than preceded other development, because gold-mining raised wages for a time far above any scale of wages that farming could afford. But this was only for a short time, as her rich lands soon attracted the less adventurous souls and those whose first attempts at mining were unsuccessful, which soon brought her agricultural production up to a point where it not only supplied her own population, but left large quantities for exportation.

In British Columbia the reversal was still more marked and still continues, for we are, up to the present, far from raising enough farm products for our own consumption, and this Province cannot hope to succeed in developing widely on the many lines of production for which she has raw material without the first pre-requisites—namely, cheap food and consequent lower wages.

In following, further, the example in the report of the Royal Commission of 1911, this Board hopes it will not appear superfluous for it to refer to some of the principles underlying taxation as set forth by students of political economy, of which science taxation is a very important branch.

Political economy is defined as that part of science which investigates the production and distribution of wealth, and wealth may be defined as those things produced by mankind that yield to individuals the support and comforts of life. Adam Smith, first eminent writer in English on political economy, in the opening sentence of his great work, discloses to us the first and most important factor in the production of wealth—viz., labour. He says: "The annual labour of every nation is the fund which originally supplies it with the necessary conveniences of life which is annually consumed, and which consists always in the immediate produce of that labour or what is purchased with it from other nations."

He shows also that the desire and ability to exchange commodities gave rise to the division of labour, and that in turn to the accumulation of the products of labour, which is called capital, and which is the great artificial factor in the production of wealth. He further traces the process of the ever-increasing growth of the power to produce wealth by the combined and organized application of labour and capital to the materials supplied by nature; all of which is by political economists included in the term "land." But in the desire and ability to exchange commodities, which has, as shown, led up to the enormous production of wealth such as we see to-day, lay also the germ of the inequality of its distribution, thereby adding to the inequalities in everything which nature produces, even in mankind, both in her kindness and in her cruelties.

The inequalities in the distribution of wealth which a nation produces divides its people into classes by raising them into many grades above the general low level, of nearly equal conditions, that obtained among mankind in a state of barbarism. And the measure of these inequalities is determined by the difference in the ability, however got or possessed, of the individual, as compared with other individuals, to draw to himself from the fund of wealth produced by the whole people, either in the process of its production or in its distribution, or in both. This inequality in the distribution of wealth which gives rise to the accumulation of its surplus that is not needed for immediate consumption, or prevents it from being consumed, so that it can be used as capital in further production, is a matter occupying the thoughts of economists and sociologists as to whether or not social and economic progress will evolve some other method by which the surplus production, now drawn into the hands of a limited class, can be saved and accumulated more equitably and economically for the community.

This is a matter for the future to solve, and that it will be solved is the hope of many. But those who clamour for it most have shown little inclination or ability to organize to take advantage of their own power, by co-operation, to modify if not eventually break down the power of the few to draw into their own hands so large a portion of the wealth produced by the nation. Until those who are so loud in their condemnation of the present system show some evidence of that ability to organize and co-operate, which implies and depends on faith in each other, it is not likely that the rest of the community will jump from the tried, nothwithstanding all its evils, to the untried, but will seek rather to eliminate those evils by gradual steps. Experience has shown that great changes, to be safe and permanent, can only be brought about by slow transitions.

With the history of the production and distribution of wealth is closely interwoven the history of the methods which have been used by Government to draw from the people that portion of the nation's revenue which is needed by every Government to carry out its functions. It is not necessary here to trace closely the changes in the methods of taxation shown in history from the "first stage of rude equality in the poll-tax"; then to the tax on cattle and lands, which were the tangible evidences of the possession of wealth; then to the different forms and evidences of wealth which have developed through higher organization of labour and capital to produce wealth, up to the present time, when the last stage somewhat resembles the first, in that Governments are looking to the individuals of the community to pay taxes in accordance with each one's "ability to pay," with that "ability to pay" measured by the amount each individual draws from the fund of wealth produced by the whole community—namely, net income.

This principle was laid down by Adam Smith when he said: "The subjects of every State ought to contribute to the support of the Government, as nearly as possible, in proportion to the revenue which they respectively enjoy under the protection of the State. In the observation

or neglect of this maxim consists the equality or inequality of taxation." This maxim has been approved by most of the writers on taxation, though some writers on political economy have tried to qualify it in one way or another; but as the power of legislation and taxation has been largely controlled by those whose revenue "which they respectively enjoy under the protection of the State" would have been materially lessened by its strict application, it has been slow in finding expression in law, and even when so expressed has been more or less evaded because of that lack of social conscience which John Stuart Mill so deeply deplored, in his time, in England, and it is an open secret that, until recently, the wealthy classes in the United States made their success in escaping taxation, a subject for cynical jest.

But in recent years a closer analysis of taxation has been made by the public in nearly all countries, and especialy in the United States, where a great change seems to have come "over the spirit of the dream" of the wealthy; whether from a dread of something worse happening than their having to pay a fair share of the cost of Government, or for some other reason more creditable to themselves, is a matter for conjecture. However, one of the leading economists of that country, Professor Seligman, speaks out, apparently with some hope of being heard, in these words: "Amid the clashing of divergent interests and the endeavour of each social class to roll off the burden of taxation on some other class, we discern the slow and laborious growth of standards of justice in taxation and the attempt on the part of the community as a whole to realize this justice. The history of finance, in other words, shows the evolution of the principle of faculty or ability in taxation—the principle that each individual should be held to help the State in proportion to his ability to help himself." And he says further: "To arrange a system of taxation which shall, on the whole, correspond as closely as possible to net revenue of individuals and social classes, and which shall take into account the variations in the taxpaying ability, has thus become the demand of modern civilization."

This is the demand which a majority of the people of this Province is making, and one which its Government is anxious to satisfy. The people of this Province must realize, however, that there is no source from which a nation's revenue can be produced other than by the application of labour to land (that is land in its widest meaning), except by robbery through war on other nations or by cheating them in trade, and these have always reacted in the long run against the nation which used such methods.

Another fact which should be kept in mind is that the person who cannot or will not help himself can pay no tax, and it is idle for any one to plead, whether he be wage-earner, farmer, manufacturer, merchant, or capitalist, that because his energies or his capital seem to be an important factor in the production of wealth he has good grounds to ask exemption or relief from taxation.

Yet one will often hear the plea: "I should not be penalized by being taxed for improving my land, or for building my house, or for bringing in and employing my capital." The absurdity of such a plea will appear when it is realized that the tramp can pay no taxes, nor the invalid, nor the imbecile, nor could the idle rich if they did not inherit stored-up labour from some one else.

Therefore, out of the product of the people's labour must be paid the cost of government, and that cost should bear some reasonable proportion to the amount of the wealth produced by the people. If a Government is extravagant or wasteful, it is drawing from its people capital which should be left in their hands to be employed in the production of more wealth. In every country this is an important matter, and is especially so in a new one. We take the liberty of referring to this matter because there was some very pointed criticism relating thereto made by some of those who appeared before this Board on matters affecting taxation, which indicates that the cost of government is being considered seriously by the taxpayers.

The sources of revenue in this Province seem many and various, but, with the exception of that part of it received from the Federal Government, it must all come through the economic units of the community, and these units are divided into classes by the nature of their economic activities as applied within the opportunities the community affords them for the exercise of those activities. These economic units may be classified as follows:—

(1.) Persons:
(2.) Persons having land under their control given them by the community; and
(3.) Persons employing capital for the purpose of making profit by its employment within the community.

In any one person may be combined any two or all of the above characteristics of these units, and, if so, then he may be taxed under any or all of those qualifications which he possesses.

(1.) TAX ON PERSONS.

At the present time there is a tax on some persons under the provisions of the "Poll-tax Act." This Board is aware of the fact that in nearly all civilized countries economic organizations have reached a point of development where, in the distribution of the wealth produced, the channels through which other classes can draw from the wage-earners nearly all but a bare living have been made so numerous and perfect that their Governments refrain from levying a direct personal tax upon those who work for wages, and it is only on such grounds as these that the exemption of any class of residents of a country from taxation can be justified.

This Board does not think that this condition has been reached in this Province, and surely there is no able-bodied man who will plead this as an inability to pay a poll-tax. We therefore recommend that the poll-tax be continued, and that its application be extended to all male residents between the ages of twenty and sixty years, without exception other than those who are exempt under subsections (*a*), (*b*), (*c*), and (*e*) of section 4 of the present Act. The Board is of opinion that the condition of this Province is such, in respect to the ability of all classes to pay and in respect to the need of revenue by the Government, as to justify and demand this. As soon, however, as the conditions above referred to become so changed as to permit of this tax being abolished, we recommend that it be discontinued.

(2.) TAXES ON PERSONS (INCLUDING CORPORATE BODIES) WHO HOLD LAND.

This Board would discuss under the heads of those who hold land (*a*) for use, and (*b*) for speculation.

Lands held for use may be divided into the following classes:—

(1.) Lands held for agricultural and horticultural purposes:
(2.) Lands held for mining purposes:
(3.) Lands held for and as timber lands:
(4.) Lands held for building purposes:
(5.) Lands held for an increase in value to come from the increase of population and the wealth created by that factor.

In dealing with Class (1) as a source of revenue, we submit the following as an analysis of the factors and conditions which should determine the valuation of agricultural and horticultural lands for the purpose of taxation:—

When a person gets control of a piece of land, as nature presents it, for agricultural use, he directs his energies to making whatever improvements may lead to that end, by putting up buildings, clearing, draining, etc., and the undertaking presupposes he has enough capital to maintain him and pay taxes until he gets it to a stage of development to do so.

He has a double object in view; First, to get a living therefrom; and, second, to store up a certain amount of capital—surplus labour—in the land until it reaches the normal limit of its productiveness. The capital value being so stored up at any stage of the process of development will be measured by the difference between what it costs him to grow and take his produce to market and the price he gets for it. If the last is greater than the first, the difference will be the interest he is getting on his stored-up capital, and will express the rental value of his property at that stage.

There are other factors generally acting to add to the value created by himself, and these in new countries are usually very material—namely, the roads and other improvements made by the community and the growth of the community itself.

Between the time he begins upon his land and the time he has brought it up to a point of productiveness at which it will support him and pay taxes, the difference between his expenses and his income must be paid out of capital drawn from some other source than this land, and this capital is invested in it on the faith of its prospective value. This indicates that the amount of taxes levied by the Government on this land at any point in the initial stage of its development must be levied not on its value at that point, but on its prospective value, and can find justification only on the grounds that the general development of the country by public improvement and the growth of the community is a material factor in giving value to his holding and adding to his "power to pay." Until the time his holding reaches a stage of productiveness which affords

him a living and pays taxes the valuation for taxation must be arbitrary and speculative, but when it does reach that stage, then the true basis for taxation has been established—namely, its rental value.

There is in the mind of some people the idea that there is no limit to the increase of the value of farm lands; that their value keeps on increasing in the way in which city property increases, and that there is a sort of alchemy about farm production; but this is easily dissipated by experience, and to some it is a very costly experience. In human affairs it is necessary to bring in the law of average to arrive at some values, and this applies very fittingly to the valuation of farm lands.

The average value of farm lands under normal conditions, and when prices are normal, is determined by the comparative natural productiveness of the soil to grow those crops which form the staple foods of the community, such as wheat, oats, vegetables, and meats. This criterion may seem disturbed by special circumstances or conditions over certain areas or for short periods of time, but taking any country as a whole and over a long period of time the average will be found. Some parcels of land will be above or below the average, partly because of their soil being rich or poor, or being near to or far from market, or other factors bearing unequally upon them; but the comparative value of each will be its rental value, and that, capitalized, will determine its sale value.

Its rental value is, therefore, the measure of the income of its owner from it, or the measure of the rate of interest he is getting on his investment, as well as the measure of the taxes he should pay as compared with others whose taxes are based on the volume of their income.

After giving considerable thought to this question of taxation of agricultural lands, this Board herewith submits the proposed amendments to be made to the "Taxation Act," which will result (if they accomplish what they are intended to do) in taxing all farm holdings at the current rate on whatever value each may be assessed for up to a value of $25 per acre, which is equal to a tax at the present rate of 25 cents per acre on lands that reach that value, and when they get above that value, then whatever assessed value is made above that amount should be based on rental value.

This Board knows these recommendations constitute a wide departure from old methods of taxation, but the justice on which these recommendations are based is supported by the fact that there is no class in this Province which needs the encouragement that comes from fair treatment more than the farmers do, and that as compared with farmers in the Prairie Provinces their taxes are excessive.

PROPOSED AMENDMENTS TO "TAXATION ACT."

Amend section 52 of Act by striking out, and substituting the following:—

"Where the assessed value of any piece, lot, or subdivision of land, according to the assessment roll, is so small that the amount of tax imposed under the rate fixed by law will not subject such piece, lot, or subdivision to the payment of one dollar, then the said sum of one dollar shall be placed on the assessment roll as the tax against such piece, lot, or subdivision, and the Assessor shall value and assess each piece, lot, or subdivision separately, and shall enter the same on the assessment roll as a separate item."

Repeal section 86, and substitute the following:—

"The Lieutenant-Governor in Council may from time to time appoint three persons, who are residents of the assessment district for which they are appointed, to be a Court of Revision and Appeal in respect of the assessment of property and income as aforesaid for such district, and such persons shall record the proceedings of the said Court and deposit such records with the Assessor."

Amend section 91 by adding the following:—

"Provided, however, that where any owner of real property held and used for agricultural or horticultural purposes, of not less than twenty acres in area, and which is assessed at a value over twenty-five dollars per acre, makes an appeal against the assessment made by the Assessor, and makes a sworn statement as to its value based on its rental value, inclusive of buildings, the Court of Revision may fix the assessment at any value over twenty-five dollars per acre which is based on its rental value capitalized at ten per cent."

The Board submits also an amendment to the Act providing that increment tax be collected through the Registry Office on that portion of the price paid for land which appears above its assessed value.

Add a new section as 113A:—

"Where land or real property, or any portion thereof, is sold for a price in excess of a value equal to one-half of the sum of its assessed value for the two years next preceding such sale, there shall be payable upon the registration of the deed of transfer of such land a tax of five per centum on the increase of the value of said land over and above the value so determined, excluding in all cases the cost of improvement or development work done upon or in connection with such lands between the time of the last assessment and the time of sale."

In respect to the method suggested for arriving at the true basis for assessment of farm lands, it may appear that we have placed the percentage, at which rental value should be capitalized, too high, but in this Province, where leases are generally for short terms, the owner nearly always, and wisely too, undertakes to pay taxes and keep buildings insured, and beyond ordinary repairs he has to provide material for any important changes, and both material and work to build new or rebuild old buildings.

We would add, too, our reasons for not recommending the exemption of improvements on farm lands from taxation, which was recommended by both the Royal Commission on Taxation of 1911 and the Royal Commission on Agriculture of 1913. We think the proposal is based on a wrong principle, and its inconsistency will be easily seen, at least in respect to farm lands, if the rental value is considered.

For the purpose of production the improvements merge into that value and become inseparable from the land. Who can tell, from time to time, apart from the visible improvements, the cost of improving certain lands—clearing, dyking, draining, etc.—some of which disappear in the doing and some of which must be constantly repaired? Only the men who have borne the cost, a cost in some cases far beyond the price for which the land could be sold. And who can tell what a piece of land now improved would be worth in its natural state? There is no system of taxation can equalize the inequalities of good or ill in nature. It is only results, and not the energy and labour spent to produce them, that can be taxed.

The exemption of improvements from taxation, like some other expedients, has been suggested as a means of relieving a class from unequal and excessive taxation, brought about by a false system of estimating farm values, exaggerated in periods of speculation or gambling on future values, and which can only be corrected by taking rental value as a basis for taxation and taxing farmers in accordance with their "ability to pay" as compared with other taxpayers.

It is not our purpose to enter into any of those intricate questions of "payment for service rendered" or "benefit theory" of taxation with which economists deal, but it will be observed that we have recognized the right of the Government to levy on the landholder, without any regard to these principles, a basic tax or royalty on the land for the security of tenure given him as against any one else, and to pay for road-building and other public improvements to the extent of 25 cents per acre or whatever lesser sum the assessed value may indicate, together with whatever income-tax he may be found liable, to help to pay for general administration of Government.

In formulating the above suggested changes in respect to the taxation of farm lands, we have had in view, and had hoped to be able to submit in this respect, a recommendation to establish "road districts" in this Province similar to those which have been established in New Zealand and Australia, or to the "local improvement districts" established in Alberta and Saskatchewan outside of municipalities, but we regret to say that the time we have had to give to this matter has been too short for us to formulate a system which we could submit with confidence that it would prove suitable to the conditions in this Province. We think this can and should be done, in order that opportunity for and responsibility of increasing taxation on land may be put in the hands of the owners thereof, who may then fix the measure of the help they are able and willing to give to whatever amounts the Provincial Government may deem advisable to spend on such work out of general revenue, and which may in time reduce the amount of taxes levied by the Government on this class of property.

Small Holdings.

In respect to the assessment of lands held in areas of less than 20 acres, we are of the opinion that any lands divided into small holdings are put into a class different from that of farm lands. Where land is subdivided it is given somewhat of an urban character, and "site" value will enter into its assessable and sale value. Inasmuch as such subdivision makes more roads necessary, a heavier taxation is justifiable, and a rental value for agricultural purposes would be an unfair guide for such taxation. We must therefore recommend that such lands be assessed at their cash value, as is now provided for in the "Taxation Act."

We would add, further, that the subdivision of land into small areas should be discouraged, as we have evidence to lead us to believe that a great deal of harm has resulted from this being done in several parts of the Province. Indeed, British Columbia has prepared, in this respect, for an urban and suburban population that would accommodate half of the whole population of Canada.

The conditions that have been brought about in this Province through "high commercialism," where middlemen in cities, aided by cold-storage facilities, have been taking from the community, between the producers and consumers, from 10 to 100 per cent. on the price the producers get for their produce, led some individuals, encouraged by real-estate agents, to think that by filling the place both of producer and middleman they could from a few acres of land make not only a living, but a competence in a few years. It is known, however, that experience has taught many this is not so easy to be done; indeed, the disappointment of some who have tried is painful history.

Although there are no landlords here to prevent land from being subdivided, as under the metayer system, to a point where there would be no margin for rent between a living for a family and the produce of the holding, or to use similar means to that used by one of the great Scotch landlords who deported some of his crofters to Canada for fear that the subdivisions would get so small as to leave no margin for rent, it will be found that the middlemen's profits here will prove quite as great a check against close subdivision as the landlord's rent in Europe.

(2.) Taxation of Land for Mining Purposes.

We have no good grounds for thinking that the present principle, as set forth in Part V. of the "Taxation Act," for the taxation of land from which ore or mineral-bearing substances are taken should be changed; nor can we recommend at the present time any change in Part I. of the "Taxation Act" providing for the taxation of coal, and of lands from which coal is being mined, and of coal lands assessed under Class B; but we think that further time for inquiry might have led us to recommend that the income of persons and companies carrying on coal-mining should be brought under the income-tax part of the "Taxation Act," from which they are specifically exempt. To do this no doubt would necessitate some reduction of the tax on the coal produced from the mines as now provided.

(3.) Timber Lands.

In respect to the taxation of timber lands, we have some very strong evidence to show that the increase of the rate from 2 to 3 per cent. on the assessed value of Crown-granted timber land has resulted in placing the owners thereof under unequally heavy burden as compared with those holding licences for timber land, but we have not had the opportunity to investigate this and other matters connected with taxation of timber land closely enough to recommend any change in this branch of taxation.

(4.) Land held for Building Purposes.

This class of land consists mostly of land subdivided into small lots, and should be assessed on the same basis as lots in city municipalities—that is, at sale value.

(5.) Wild-land Tax.

We cannot recommend any change in the present taxation of wild land, though we do think it is one of the branches of land taxation that requires full investigation and consideration.

PERSONAL-PROPERTY TAX.

Personal property exists in many forms, as is shown by its definition in the "Taxation Act," but they may be divided into two classes:—

(1.) Machinery, implements, live stock, and other movable property, including liquid or circulating capital used in the production of fixed capital and goods for consumption:

(2.) Consumable goods in the hands of producers and of merchants for sale.

The inequality in the value of the personal property used in the different lines of production to produce equal values is too well known to need pointing out, and as it is the value of the things produced and not the value of the means used in their production that gives the "ability to pay," it is the former and not the latter should be the basis of taxation in order to make it equitable.

And it is equally well known that the movement of goods from the producers or manufacturers to the merchants and traders, and through them to the consumers, is so different as between one kind of goods and another that to tax the producer or manufacturer and the merchant or trader on the value of the goods the Assessor may happen to find in his possession at one period in each year is so manifestly unfair that to pursue it is an offence to all sense of justice, and points to the taxation of profits made by those engaged in the production and distribution of goods as the most equitable system of taxation.

From time to time changes have been made in the law to reduce the glaring inequalities of the burdens imposed under this branch of taxation, such as exemption of some of the implements and other means used in production, which reveal the untenable ground on which it is based, until it has now become "a thing of shreds and patches."

This Board has therefore to add its recommendations to those of the Royal Commissions on Taxation of 1905 and 1911, that this tax be abolished except in those cases where the use of certain kinds of personal property has to be regulated, and registration and licence fees are levied for that purpose.

INCOME-TAX.

Under the provisions of the "Taxation Act" which provide for the levy of a tax on income are included all those of the classes of persons above named who have incomes large enough to be taxed thereunder.

The definition of "income" in the "Taxation Act" is clear and exhaustive, but the following is quoted as a brief summary of what it is from another point of view:—

"Income is the returns which come into the individual as the result of his own economic activities or from the control of the economic activities of others."

For the purpose of taxation net income only is assessed; that is, the gross income less the amount expended in producing it, and the tax is levied without any consideration as to the amount of capital or other factor employed in getting or acquiring the income. It may come from profits on invested capital alone, or from the applied ability of the individual alone, or from both these or any other factor or factors combined.

Economists are almost unanimous in opinion that the imposition of a tax on income is the most equitable of all methods of taxation, because it takes from the individual or economic unit in a progressive ration a part of the amount he draws from the fund of wealth created by the community, without impairing the capital or any factor employed in the production of that wealth; whereas, in taxing improved lands producing food, or personal property or persons, there is a danger that the very sources of the production of wealth may be weakened or destroyed.

The great industrial and commercial development that has taken place in modern nations, generally carried on by bodies made corporate by law, which have drawn capital together under the joint-stock system aided and co-ordinated by banking institutions and supported, directly or indirectly, by other financial corporations, including life insurance and other similar companies, has called into existence new economic units which draw, first under their control and gradually into their possession, nearly all of the surplus earnings of the old economic units, and in consequence have weakened or destroyed the "ability" of the latter "to pay" the amount of revenue needed to meet the ever-increasing expenditure of modern Governments.

With the development that has given rise to these new and great economic units, and contributing largely to their growth, came an increase in international commerce that made it

impossible to readjust on the old forms of property, either real or personal, or by way of tax on licences or franchises, or to trust to a "diffusion" of the burden as between the economic units within the nation, such as could have been made and done if no such international commercial exchanges had taken place. These factors and resulting conditions have appeared in most countries; hence the need to find new sources of revenue has been forced on nearly every Government, and "income-tax has come to the forefront of public discussion with comparative rapidity."

Under the pressure of this need most Legislatures are declaring in favour of imposing a tax on incomes as well as a tax on inheritance, and in doing so have consciously or unconsciously declared once more the sovereignty of the community over the individual, a sovereignty that seemed to be eclipsed by the strong "individualism" which grew up during the last century in modern democratic nations; a declaration emphasizing the fact that the individual owes his personality to the community, and that the wealth he draws from it must be under the control of the State.

How far this "individualism" behind capital has led to the lack of unity in this country may not be within the scope of our work to discuss, but we venture to say we think it beyond question that it has not hesitated to use any means that it could control to make dividends on capital invested as large as possible, even to the extent of introducing labour of a race ethnologically so far apart from the parent race of the community as to cause immediate irritation, and, no doubt, disturbances in the future.

A lack of social and political morality in some of the classes whose incomes are large enough to make them liable for income tax has been pointed to as a reason that it should not be imposed, because the honest will pay and the dishonest will escape; but we wish to join with the Royal Commission on Taxation of 1911-12 in saying "we have too firm a faith in the integrity of our fellow-citizens to suppose that any such low standard of probity exists in this Province as would deter them from following out the natural evolution of fiscal policy." And we have no doubt but that with the aid of a careful Assessor each taxpayer will be able to estimate the amount of income he is drawing from the community.

We submit the following as changes which should be made to the "Taxation Act" in respect to exemption from and the rates of taxation on income as being more equitable than the present ones:—

INCOME-TAX EXEMPTIONS.

Proposed Amendment to Section 8, Subsection (18).—Strike out subsection (18) of section 8, and substitute the following:—

The income of single persons, including widows, widowers, or divorced persons without children, under seventy years of age	$ 800
The joint income of husband and wife living together without children under sixteen years of age	1,200
The joint income of husband and wife living together or either as a parent with children under sixteen years of age and $200 for each child under sixteen years of age.	1,200
The income of single persons over seventy years of age	1,000

NOTE 1.—The reason for the proposed change is obvious. No encouragement should be given to expensive living in a country so much in need of capital as this is, and those who can and will live luxuriously will not suffer by the change.

NOTE 2.—This Board thinks it is inconsistent with the principle on which a portion of the income of an individual is exempted—viz., a reasonable amount to live on—to allow any exemption to a body made corporate by law.

That the part of section 9 fixing the rates for taxation on income be struck out, and the following be substituted therefor:—

		Per Cent.
Class A.	On any sum not more than	$ 2,000.. 1
„ B.	On any sum not less than $ 2,000 and not more than	2,500.. 1¼
„ C.	„ „ 2,500 „	3,000.. 1½
„ D.	„ „ 3,000 „	3,500.. 1¾
„ E.	„ „ 3,500 „	4,000.. 2
„ F.	„ „ 4,000 „	5,000.. 2½

						Per Cent.
Class G.	On any sum not less than	$	5,000	and not more than	$ 6,000..	3
„ H.	„	„	6,000	„	7,000..	3½
„ I.	„	„	7,000	„	8,000..	4
„ J.	„	„	8,000	„	9,000..	4½
„ K.	„	„	9,000	„	10,000..	5
„ L.	„	„	10,000	„	12,500..	6¼
„ M.	„	„	12,500	„	15,000..	7½
„ N.	„	„	15,000	„	17,500..	8¾
„ O.	„	„	17,500	„	20,000..	10
On all sums over					20,000..	12

PROPOSED NEW FORM NO. 7.

Deductions allowed.

No. 1. Amount deducted, exempted under the Statute but only to natural persons, and not to include bodies made corporate by law.

No. 2. Outgoing or necessary expenses actually incurred and paid out in the production of the income by the taxpayer, other than expenditures on capital account or on reinvestment account.

No. 3. An allowance of a sum for anuual depreciation by ordinary wear and tear of the plant, machinery, equipment, and buildings, such sum to be based upon the probable annual average cost of repairs and renewals necessary to maintain the same in a condition of efficiency, and in no case to exceed for any year ten per centum per annum of the value at the commencement of such year, such value to be appraised by the Assessor.

No. 4. Losses and bad debts arising out of the business from which an income is derived, irrecoverable and actually written off during the year, but not otherwise.

No. 5. For municipal taxes and rates paid on real property from which an income is derived, but not otherwise.

No. 6. For all income derived from shares or dividends from companies or corporations (not being companies or corporations taxed under Part II. or under Part V. of the "Taxation Act") where such companies or corporations are assessed direct upon the real and personal property and income of such companies, but not otherwise.

No. 7. Money or capital received during the year as the price of any property sold, or any money paid back which was lent out on mortgage or other security, or payment of insurance due the taxpayer, or any capital paid to the taxpayer to which he is entitled from any investment whatever.

NOTES.—When the taxpayer keeps regular books showing his annual business, the figures given in the above returns must be correctly stated in accordance with such books, and such books shall be open to the inspection of the Assessor to enable him to verify the same. Stock-in-trade must be entered in the above return at the inventory value given in said books.

Deductions not allowed from gross income: (1) Any debts or liabilities paid out of income in any one year, where such debts or liabilities were not actually incurred in producing the income of that year; (2) any expenses or charges which ought, in the opinion of the Assessor, to be chargeable against the capital of the taxpayer and not against revenue; (3) any loss or expense not incurred by the taxpayer in the effort to produce the income; (4) the cost and maintenance of the taxpayer and his family, or establishment, or rent of house occupied by him; (5) domestic or private personal expenses; (6) taxes on real property, or on personal property, or on income, or any rate levy, tax, or assessment whatsoever, whether imposed or made or levied by or pursuant to any Act of the Parliament of Canada or of the Legislature of British Columbia, except the municipal taxes and rates allowed to be deducted under the said Form No. 7; (7) any loss or expense recoverable under any insurance policy or contract of indemnity, or not proved to the satisfaction of the Assessor, or which in the opinion of the Assessor ought not to be considered a loss, outgoing, or expense incurred by the taxpayer in the production of the income; (8) any income transferred from the gross income of the taxpayer to a sinking fund, contingent fund, reserve fund, or undivided profits; (9) income derived from any source outside this Province, if such income is brought into or used in this Province; (10)

any interest on borrowed capital from which an income is derived; (11) capital spent on improvements or betterments, or on account of interest which such capital would have brought if invested; (12) for any expenditure of a capital nature or for renewals or extensions; (13) for directors' fees, and for salaries of persons holding office as directors, and for the salary paid the president, vice-president, and general manager of any company or body corporate.

(*New.*) Provided, however, if a general manager is residing in this Province and is employed in the actual work of carrying on the business of the company, a deduction for his salary not exceeding $5,000 per year may be made. The following items to be filled up by the Assessor only:

1. The tax on personal property is ..... $.
2. The tax on income is ..... $.
3. The greater tax, or if 1 and 2 are equal, then the tax on income (2), as the case may be, is ..... $.

If the recommendation of this Board to discontinue "personal-property" tax be adopted, items 1 and 3 must be struck out.

The amount of No. 3 being the only tax payable by the taxpayer for personal property and income.

Reasons for Changes.

The reasons for recommending the changes to be made in Form 7 as submitted are as follows:—

This Board is of the opinion that it is inconsistent with the principle on which a portion of the income of an individual is exempted from taxation—viz., a reasonable allowance for cost of living—to allow any exemption for that purpose to a body made corporate by law.

The amendment made to No. 2, by striking out the words at the end thereof, "or to replace or provide against depreciation," is explained and provided for by No. 3 in form submitted.

The reason for recommending the striking-out of No. 3 of old form is that it must be assumed that capital invested in any undertaking is so invested with a fair certainty that sufficient profits will come from the investment to pay interest and any taxes imposed by the Government of the country in which it is made; and even if the principle were admitted, there being so much difference in the profits arising from the same amount of capital in different ventures even of a similar nature and investments of capital in ventures of a different nature, the amount of capital invested would be no guide by which to make exemption or deduction that would be fair to the owners of capital in the different ventures. Therefore this Board recommends that no interest be allowed to be deducted from profits before income-tax is levied thereon.

No. 3 of form submitted provides for allowance for depreciation, and is virtually a copy of the Ontario "Mining Tax Act."

No. 4 is a copy of No. 4 in Form 7 of present Schedule. The Board shows No. 5 of the present Form 7 eliminated for the reason that any one paying premium for life insurance is storing up capital in that way for future use or profit, and is the same in result as when a wage-earner stores up capital in buying a house by paying for it in instalments, or a farmer stores up capital in improving his farm. The Board is aware that this deduction is allowed in England, but, notwithstanding this, thinks it is wrong in principle.

No. 5 in the form submitted is a copy of No. 6 in Form 7 of the present Schedule, and No. 6 is No. 7 in the said form.

No. 7 in the form submitted is self-explanatory and only gives expression to a principle implied in the Statute.

Mining Taxation.

Re Allowing for Exhaustion of Mines.

This Board, after hearing the evidence submitted and the pleas made to support the proposal that such an allowance be made, cannot recommend that any such allowance should be made before income-tax is levied on net profits; for these reasons:—

There is no law we have found providing for such in any country whose laws we have inquired into where the taxation on mines is a tax levied on the net income therefrom, and in England the decisions of the Courts are clearly against it. It is safe to assume that before capitalists invest money in a mine they will know with a great degree of certainty the value of the ore-deposit therein, or, rather, they will have some proof that there is enough ore to

justify the venture, and will believe that in the operation of producing and selling the product of the mine they will be able to make enough profits to pay interest on the capital invested and create a sinking fund to replace the capital invested before the mine is exhausted.

They will be guided by the same principle by which a teamster is guided when he buys a horse, who expects to make enough profits from its use as will pay for feeding it and pay for another to take its place when it dies or is no longer able to do its work.

Re the Mineral-tax on the Value of the Ore, 2 per Cent.

The Board recommends the continuance of this tax, as it is levied in substitution for all taxes which *might* be levied upon the land from which the ore or mineral is taken, a tax on the estimated value of the ore in the ground, and for the personal property used in the working of such mines.

The great efforts that have been made to show that to levy this tax and to tax the profits made in the undertaking is dual taxation must fail under a proper analysis of their relation.

The mineral-tax is imposed on the party who is given possession of the mine, by licence or otherwise, and because he has been given control of it as against any one else in the community and secured by law in that control, and has no relation whatever to the principle or the basis of a tax on net income.

It is levied on the same principle on which a farmer is taxed for the privilege given him by the community for the exclusive use of his farm, and for the benefits that he receives from the community in the enjoyment of that use, and has no connection whatever with the tax levied on the profits he makes out of the community by the exercise of his energies applied to that farm. And the tax that is levied on farmers' profits is no greater in proportion than the tax levied on other taxpayers who have no privilege or licence to use any part of the domain of the country.

RE ALLOWING INTEREST ON CAPITAL INVESTED BY A COMPANY IN A VENTURE TO BE DEDUCTED FROM PROFITS BEFORE INCOME-TAX IS LEVIED THEREON.

This Board submits such should not be allowed. First, it is the amount of the net profits made by a company or individual which is the measure of the value of the opportunity given by the community to make such profits. This is the basis for and, indeed, proof of the fairness of a tax on net income.

And seeing that there is no fixed relation between the amount of capital invested and the amount of profit derived from the investment, it would work out unfairly to allow such deduction. It may happen—and, in fact, very often does happen—that a company investing half the amount of capital that another company invests will make as much profits from their venture as the other does.

In support of this recommendation, that interest should not be allowed on capital invested by a corporation, we quote the following from Professor Seligman. He says:—

"In England the income-tax payable on annual profits or gains, according to Schedule D of the income-tax, is advanced by the corporation, and is deducted by it from the dividends on interest due the security-holders, who are then to that extent exempt from the income-tax."

He says further: "Taxation of interest on corporate debt is not double taxation, because the coupons, like the dividends, are integral parts of the income; because both bonds and stock together form what is really the working capital from which the income is derived."

There is therefore the best authority for not allowing the deduction of interest on borrowed capital before income-tax is levied, and this principle will hold, with equal force, against allowing any rate of interest on invested capital being set aside before income-tax is levied on net profits.

PART II.

We recommend that persons taxed under Part II. of the "Taxation Act" be brought under the income provisions thereof, and that the Act be amended for that purpose.

RE COLLECTION OF TAXES.

This Board is of the opinion that the system of allowing a discount or rebate for the payment of taxes is wrong in principle and cannot be justified.

When taxes are levied it may be assumed that they are levied to raise a certain amount of revenue, and that the levy is made on the basis of "ability to pay" of each taxpayer, as evidenced by the assessed value of his property or power to pay, and to make that levy less on any class of the taxpayers for any reason whatever is doing a wrong to the other classes of the taxpayers, whose burden is increased in consequence.

That some may not be able to pay on the date taxes become due and payable is no reason that they should be made to pay more than their share of the required revenue. If justice is desired to be done, the amount of taxes levied against each taxpayer should be collected in full, and if any fail to pay at the date fixed for payment they may in fairness be asked to pay interest at a rate which it will cost the authority levying the taxes to borrow the money needed until the taxes falling in arrears are paid or collected.

To allow a fair bank discount on taxes paid on any date after the date at which they become due to the end of the period within which they may be paid would be fair, if practicable.

We regret that such an unjust system has found a place in the taxation laws of our Province, and express a hope that it will be abolished both in our Provincial and municipal systems, in the latter of which it has reached an inexcusable extreme. With this in view, so far as Provincial taxation is concerned, we submit proposed amendments to the "Taxation Act" in respect to the collection of taxes, as follows:—

(*a.*) Amend section 8, subsection (28), by striking out all the words after "municipality" in the second line thereof.

(*b.*) Repeal section 10, and substitute the following therefor:

"10. The aforesaid taxes shall be due and payable on the second day of January of the year for which said taxes are levied, and may be paid without interest at any time from such date up to and including the thirty-first day of March of said year, but if such taxes are not paid on or before the last-named date interest shall be charged thereon as provided in sections 211 and 212 of this Act."

(*c.*) Repeal section 112, and substitute the following:—

"112. In case there should be arrears of real-property tax, personal-property tax, or income-tax due by a taxpayer, and he should desire to pay off a portion of the said arrears before proceedings are taken for recovery thereof, the Collector may accept the amount tendered; but the amount so tendered shall in no case be less than one full year's taxes with interest thereon at the rate of six per centum per annum on all taxes so tendered in arrears for any year up to and including the year 1917, and with interest at the rate of eight per centum per annum for all taxes in arrears after that date to the date of payment; and the Collector shall apply the said amount to clear off the farthest back year or years in arrears (as the case may be) and grant a receipt therefor, and he shall state upon such receipt what amount is still due and owing by such taxpayer for real-property tax, personal-property tax, or income-tax."

(*d.*) Repeal section 148, and substitute the following:—

"148. The taxes imposed upon corporations, including banks, under this Part of this Act shall become due and payable on the second day of January of the year for which such taxes are levied, and may be paid without interest at any time from such date up to and including the thirty-first day of March of said year, but if such taxes are not paid on or before the last-named date they shall bear interest at the rate of one per centum per month from such last-named date until paid, provided payment of such taxes with interest aforesaid is made on or before the thirty-first day of December of such year; and if such taxes with interest as aforesaid are not paid on or before the said thirty-first day of December, the said taxes and interest thereon, which interest is hereby declared to be an addition to and a part of such taxes, shall be deemed to be delinquent on the said thirty-first day of December."

(*e.*) Repeal section 149, and substitute the following:—

"149. All taxes, including interest thereon, which became delinquent on the day last mentioned in the last preceding section shall thereupon bear interest at the rate of eight per centum per annum from such date until paid or recovered. Such added interest provided for in the last preceding section and in this section shall be deemed a charge upon the property of the person whose taxes are delinquent, in all respects as if said interest had originally formed part of the taxes assessed and levied thereon, and may be recovered as a part of the delinquent taxes."

(*f.*) Repeal section 211, and substitute the following therefor:—

"211. All taxes on real property, personal property, and income unpaid on the thirty-first day of March of the year in which such taxes become due shall bear interest at the rate of one per centum per month from the last-named date until paid, provided payment of such taxes and interest is made on or before the thirty-first day of December of such year; and if such taxes with interest as aforesaid are not paid on or before the said thirty-first day of December, the said taxes and interest, which interest is hereby declared to be an addition to and a part of such taxes, shall be deemed to be delinquent on the said thirty-first day of December."

(*g.*) Repeal section 212, and substitute the following therefor:—

212. All taxes, including interest thereon, which became delinquent on the day last mentioned in the last preceding section shall thereupon bear interest at the rate of eight per centum per annum from such date until paid or recovered. Such added interest provided for in the last preceding section and in this section shall be deemed a charge upon the property of the person whose taxes are delinquent, in all respects as if said interest had orginally formed part of the taxes assessed and levied thereon, and may be recovered as a part of the delinquent taxes."

ASSESSMENTS AND ASSESSMENT DISTRICTS.

Serious complaints have been made in regard to the inequality of assessments, which this Board believes to be well founded. In fact, the strongest complaints are because of the inequality of assessment rather than in regard to the rate levied on the valuation of real property. It is evident from the information given to this Board that assessments have not been carefully made under the present arrangement. This would appear to arise from the assessment districts being too large or from there being an insufficient staff to do the work.

In view of the unsatisfactory condition indicated, we recommend that under the provisions of sections 14 and 15 of the "Taxation Act" the work of a new assessment of the whole Province should be undertaken as soon as possible, and that the Province should be redivided into smaller assessment districts, so that it will be practicable for the Assessor to do the work in the district for which he is appointed in the manner contemplated by the "Taxation Act"; that is, to know the nature and condition of the property on which he places a valuation.

RE PERMANENT BOARD.

This Board, supported by the recommendation of Professor Haig, is of the opinion that a permanent Board of Taxation should be created on the lines indicated in his report, and that the Board should be cut clear as far as is possible from all political and special interests.

With the little time at its disposal to gather information, this Board submits it would be unwise for it, without further research, to attempt to draft a measure for the establishment of such a Board and to define its powers and duties in the directions pointed out by Professor Haig; therefore this Board recommends that advantage be taken of his offer to draft a constitution for such a Board. It is evident he is fully conversant with the work the Taxation Commissions in the several States in the Union have accomplished and what has been learned from their experience. In addition to this, he has intimate knowledge of the systems of taxation in the different Provinces of our Dominion, as shown by his able report thereon, prepared for the Committee on Taxation of New York, dated March 23rd, 1915, and we have evidence that since that time he has kept in close touch with taxation matters in the whole of Canada.

"SCHOOL ACT" AND SCHOOL TAXES.

This Board, under the instructions contained in section 9 of the "Board of Taxation Act," after hearing the evidence of several witnesses in respect to the present system of rural school taxation in this Province, as well as reading the evidence submitted to the Royal Commission on Taxation in 1911, and having had the privilege of being present at a meeting of the Executive Council which was held to discuss this question with Dr. Robinson, Superintendent of Education, has concluded that the inequality of taxation complained of arising under the present system can only be removed by changing the present system to one similar to that which was in force prior to 1906.

We think that the change made at that time to apply to school districts outside of municipalities was a retrograde one, unsuitable to this Province, and not in accord with the wish of a majority of its people. We think the people of this Province regard the children within its borders as their wards in respect to giving them at least a common-school education, and that the wealth or poverty of a parent should not be a measure of the opportunity his children should have in that respect. We therefore think that the ratepayers of one school district should not have to pay more, relatively, than those of another district, and in order to prevent this we recommend that the "School Act" be changed so that the whole of the taxable lands outside of municipalities, in proportion to their assessed value, should bear that portion of the cost of education which is now being levied on the several rural school districts.

Professor Haig's Report.

The Board transmits herewith the report received by it from Professor Haig. As already stated, this Board had reached conclusions on all the important matters relating to taxation and the sources from which Provincial revenues are drawn, as set forth in the foregoing report, before Professor Haig's report came to hand. In its perusal of the latter the members of the Board found a number of matters examined in detail with which it intended to deal, but which he has presented in a clearer manner, both in arrangement and expression, than it could hope to equal; and, indeed, he has covered a wider field, and with greater freedom of criticism, in the history of the finances of this Province than it, for obvious reasons, would have wished to do.

With the general tenor of his report, both in the preface and summary, this Board is in full accord, but there are some parts with which it does not agree, and therefore a short survey of his recommendations is necessary to show wherein the Board agrees and also where it does not agree, and the reasons for such difference of opinion.

His clear and full analysis of the amount and sources of revenue shows the changes that took place in these in the period of years his survey covers, and his review of the financial history of that period from 1905 to 1917 is one for serious thought. This, coming from one looking at it from an outside point of view, clear from any local or political bias, makes it all the more worthy of consideration.

Referring to the rapid rise in revenue from 1908 until it reached its highest point in 1912-13, and of its equally rapid decline to 1916-17, leads him to speak of the other part of the process in these words: "The spending proceeded with blissful confidence . . . Equipment and governmental services have been supplied with a lavishness that consumed the very unusual revenues of the prosperous years, and which has, in addition, strained the credit of the Province."

In view of the shrinkage of the revenue and the improbability of its expansion, he points to the situation as one that gives cause for great concern, if not alarm, and says: "Unless some unforeseen event should suddenly restore the demand for real estate, the people of British Columbia must face painful economy and burdensome taxation"; and "if the Province is not relieved of the menace of the Canadian Northern guarantee the situation will be very desperate."

This review leads him to point to and emphasize the need of the Government of this Province keeping expenditure in close balance with revenue raised from the ordinary sources, and not to rely on "land-sales" and other variable sources of revenue.

This Board is of the opinion that Professor Haig is entirely wrong in thinking that the war had anything to do in causing the shrinkage of revenue, and more especially in the cessation of land-sales; for these had practically stopped before August, 1914, and, in fact, there is every reason for believing that the war has had an opposite effect, in that it has helped to make many able to pay their taxes.

This Board is pleased that he anticipated it by his recommendation that a permanent Taxation Board be created with power to co-ordinate all the different branches of the work connected with assessments for and collections of taxes. We will refer more fully to this matter before concluding our report.

We will now deal with the matters on which we cannot agree with Professor Haig in addition to that already referred to—namely, the influence of the war upon the shrinkage of revenue.

It is our opinion that he has failed to grasp the situation in regard to the taxation of farm lands. If he had examined the assessment rolls of some of the assessment districts for the

years from 1905 to 1908, and compared the then assessed values with the assessed values of the same properties for the years from 1910 to 1914-15, and then with the values from the latter year to 1917, and tried to have discovered the causes for the rise in the values in the first period and the causes for their shrinkage in the latter period, we think he would have hesitated to say that 1 per cent. on farm land as now assessed is "not inordinately high," even in view of the "services rendered."

We believe there is no sound reason for this class of lands to be assessed higher in 1913-14 than they were in 1907-8, except where improvement made them more productive, and instead of values being lowered since 1914 they should be increased if the price of farm produce were taken as a basis for valuation. For this Assessors are not to blame, because under the provisions of the "Taxation Act" they cannot ignore the effect on prices of land that come from any wave of insanity of speculation to inflate land-values.

One per cent. might not be "inordinately high" if assessed values were on a sound basis, but there is hardly a district in British Columbia where inflation of values did not take place. If there is going to be any scientific system of taxation established in this Province, it cannot be based on this unsound and unscientific principle, for scientific taxation must mean equality of burden based on "ability to pay," and they who can readjust our taxation to reach that position or approach it most nearly are the best experts.

Professor Haig refers to the result of the imposition of the "wild-land" tax leading to "confiscation." This is a harsh word to use in this connection and hardly justifiable.

That it may lead to some having to sell land for less than they paid for it, or give up their venture, may be true, but the speculators who buy from the Government and lose are in no worse position than those who buy from private owners and lose. If they who buy from private parties fail to make good their payments, the property reverts to the original owners, and it is difficult to see why the same law should not apply to those who purchase public lands. Parties who have bought from the Government cannot say they have been wronged by the imposition of a new tax, for a "wild-land tax" has been a part of the taxation policy of this Province for a long time.

It is held by some that there is an implied contract on the part of the Government to make certain improvements out of the money received from these investors; but, if so, is there no implied responsibility on the part of these investors? Does not the imposition of a wild-land tax imply this? In so far as it is held to be a penalty for non-use of land it certainly does. Where men who have control of capital—the accumulated labour of the community and of which they are trustees from a community point of view—and invest that capital in land with the hope that the work and growth of the community will enhance its value to make such investment profitable, and the community fails to do so, it is a misfortune both to the investors and the community itself; for the value received on one side of the bargain—that is, by the investor—has not been realized, and is therefore a loss as compared with transactions where value received on both sides is made productive.

The whole situation is a matter for regret, and in the opinion of this Board is one that points to the need of making occupation and use part of the consideration to be given by those who are seeking to get control of any part of the public domain of this Province.

There is no need for us to make special reference, by way of comparison, to Professor Haig's opinion in regard to the taxation of mining and other companies and on income-tax, but will leave his opinions and our views to stand for your consideration.

In closing its report, this Board desires to express the belief that any diminution in revenue that may follow the abolition of the personal-property tax and the suggested changes in respect to farm lands will be more than compensated by a close assessment for and collection of the other taxes, as recommended, especially that of income-tax.

In a new country like this, where economic conditions should change more rapidly than in an old one, it gives ground for hope that the present sources of revenue will expand and that new ones will be created; but we fully recognize that all modern communities are bringing pressure to bear to force taxation to be derived from two main sources—taxation on land (i.e., on "land" in its widest meaning) and taxation on income.

And in regard to taxation on land, in so far as it is used for agricultural purposes, the tendency is to make the tax levied thereon bear some close relation to the "benefit received."

As we believe the latter can be done better by local bodies under proper Government control than by the Central Government, we have based some of our recommendations on that belief.

The great desire expressed on all sides for agricultural expansion, and the efforts being made by the Government of this Province to induce agricultural settlement, both point to the need of making taxation on farm land correspond as near as possible with the farmer's ability to pay. When most farmers are so much in need of capital as to have to borrow for purposes of developing their holdings, it is proof of the need of an endeavour to see that taxes on farm property be not excessive.

All of which, together with Professor Haig's report, communications, and transcript of evidence presented to this Board is respectfully submitted.

Dated at Victoria, B.C., the 5th day of April, 1918.

W. G. CAMERON,
THOMAS KIDD,
Board of Taxation.

INDIVIDUAL REPORT BY W. G. CAMERON.

MOTOR-VEHICLE TAX.

I recommend that the "Motor-traffic Regulation Act, 1911," section 14, be amended as follows:—

"The annual licence fee to be two per centum on the fair market value of all motors. Present annual licence fee and personal-property tax on motors to be cancelled."

AMUSEMENT-TAX.

I do not recommend any charge in regard to this tax, but think it should remain as at present.

TAXATION OF IMPROVEMENTS.

If the plan as outlined by this Board for assessment and taxation of farm lands is not adopted, I am in favour of the exemption of improvements from taxation, and recommend:—

(1.) That improvements be clearly defined in much the same way as in the "Municipal Act," section 2, with regard to district municipalities.

(2.) That land and improvements be assessed separately.

W. G. CAMERON.

INDIVIDUAL REPORT BY THOMAS KIDD.

TAXATION OF BANKS.

If that justice in taxation referred to herein is to be realized, there will have to be some change brought about in the attitude of the banks doing business in this Province.

It is an anomalous condition, which will not likely be much longer allowed to exist in Canada, that these institutions can refuse to give the information required to make each one bear its fair share of the burden of taxation imposed by the laws of this Province on income, an income which they draw from the community with exceptional powers and advantages granted them, and which would appear from known results far in excess of the value of the services they give the community.

The education of the public on matters of finance is advancing very rapidly, and the same intelligence and sense of justice that have pressed for and brought about the taxation of net income will not likely stop until these institutions are subjected to the same law as all other individuals and corporations.

MOTOR-VEHICLES TAX.

I recommend that the following fees be collected from the owners of motor-vehicles, to be in substitution for all taxes and rates that might be collected on the said vehicles under the present personal-property tax and the "Motor-traffic Regulation Act":—

One per centum on the purchase price of each vehicle in this Province when new, added to $10 fee per annum. Motor-cycles on same basis and $5 per annum, the registration fee to remain as now.

This will lessen the Assessor's work in assessing personal property and make the collection more simple by putting it in the hands of the Superintendent of Provincial Police. It probably will involve amending the provisions of the Act in respect to the assessment of personal property; this could be done by adding to section 64 of the "Taxation Act" the following:—

"Provided, however, that when any assessment is made of personal property it shall not include any motor-vehicle or motor-cycle."

AMUSEMENT-TAX.

I recommend the following Schedule to be substituted for the one in the present Act:—

	Cents.
Where the price of admission is not more than 5 cents	5
Where the price of admission is more than 5 cents and not more than 15 cents	10
Where the price of admission is more than 15 cents and not more than 25 cents	15
Where the price of admission is more than 25 cents and not more than 50 cents	20
Where the price of admission is more than 50 cents and not more than $1	25
Where the price of admission is more than $1 and not more than $2	30
Where the price of admission is more than $2	50

In recommending the increase of this tax to a scale that may seem excessive, I do so on the grounds that a tax of this kind may discourage the spending of money to excess on amusements that should not be indulged in overmuch when every one should be saving capital for more needful purposes. I would recommend further that whatever is collected from this source should go to support the different public hospitals in the Province, many of which are in great need of assistance.

On this subject I venture the following remarks on Professor Haig's reference to this tax, wherein he says: "It might possibly be justified as a war measure, designed to discourage a non-essential enterprise." And further on he says: "It is a tax that produces irritation out of proportion to its yield, and which distributes the burden with no defensible principle of taxation."

The last statement raises a point which I think is still under debate by economists; that is, whether "taxes levied on wealth in the using" can be defended on principle. It is certainly not more inequitable in distributing the burden than the tax on alcoholic liquors and tobacco, and, like the tax on these, by placing its collection on those who run the places of amusements it may be made to assume the character of an indirect tax.

This tax is not arbitrary, and as it is a tax on the consumption of a non-essential it may be looked upon as "voluntary"; indeed, the amount consumed may be taken as a measure as well as proof of "ability to pay." Like the tax on income, it may cause irritation; but as that will be largely confined to those in cities who can afford to pay for amusements of this kind, the irritation will not be serious.

I am therefore unable to see the reason for Professor Haig's opinion unless he bases it on the "subjective" aspect of the incidence of taxation, but I fear the majority of the people of British Columbia have not reached that stage of development which would enable them to appreciate the decisions of the psychological court that could determine whether the boy and girl whose opportunities to attend picture-shows have been cut in two suffer more or less mental anguish than the boy and girl who see a pet colt or a favourite brood of chickens sold by their father to pay his taxes.

But there is another aspect of this matter which Professor Haig may not have considered—namely, the effect of the thing consumed on the consumer. It has been suggested, with some strong circumstantial evidence to support it, that overindulgence in picture-shows by the pupils of public schools is distracting their minds from the more prosaic work of studying their lessons. If increasing the tax for admission to these places of amusement will have the result of lessening the attendance of that class its enforcement will be justified.

If one may judge from the great wave which has swept, with apparent success, both Canada and the United States recently in opposition to the sale of liquor under the licensing system, it is safe to conclude that there is something more than mere revenue being considered by the whole of the people in determining what shall be the principles of taxation and sources of revenue.

BOARD OF TAXATION.

In addition to the unanimous recommendation as above submitted in regard to the creation of a permanent Board of Taxation, I venture to submit the following, to which my colleague, Mr. Cameron, would not subscribe for the reason that in his opinion it was dealing with matters beyond the scope of the work assigned to this Board:—

In view of the recent proofs of lack of wisdom in the carrying-out of municipal government in this Province, I venture to suggest that the powers and duties of a Board of Taxation be extended to include the supervision of municipal borrowing and expending of borrowed money, on somewhat similar lines to that which the Local Government Board in Great Britain possess and exercise.

A prominent economist (Professor Bastable) says on this subject: "The necessity of some method of the kind is obvious; without it the numerical majority of the inhabitants of a district possessing little monetary interest in its future condition could burden all the holders of property and future residents with a load of debt." And he adds: "This power of regulation and its efficient exercise show the real unity of all public utilities."

The Royal Commission on Municipal Government had this matter under consideration, but seemed to think, as expressed in their report, that it was not advisable to establish such a system in this Province, but that "the Government should have full information as to what the municipalities are doing."

There is probably no country in the world where local bodies have had such unrestricted power as they have had in British Columbia, with results, in many cases, too well known to need to be recited, and which point to the need of steps being taken to prevent their recurrence.

THOMAS KIDD.

UNIVERSITY OF ILLINOIS LIBRARY

NOV 22 1920

SECOND REPORT

OF THE

BOARD OF TAXATION.

To Honourable John Hart,
Minister of Finance.

SIR,—We, the members of the Board of Taxation, beg to submit this as our second report, to which is attached a draft "Taxation Act." In the latter we have attempted to embody the provisions which we recommended in our first report to be made a part of the "Taxation Act," and have added others, all of which we believe are based on principles that will make taxation more equitable in this Province than it has been in the past; or, perhaps we should say, to change our system of taxation to correspond more nearly with changing economic conditions, in order that the burden of taxation may be more equitably distributed.

The taxation of land, which is the basic source of taxes, especially in a new country, is so important a part of our system that every effort should be made to adjust it fairly, and particularly in respect to farm lands. In this Province rental values, which should be taken as a basis for valuation of all classes of land, are not, even in our oldest settlements, very definitely fixed, but placing the responsibility for fixing the value of real estate on its owner, and providing that in case of sale a certain percentage of the amount he receives over the assessed value be taken as an unearned-increment tax, will have a tendency to get and keep real-estate values to a proper level and so prevent such violent fluctuations in prices as have taken place in the past.

In our former report we recommended an amendment be made to the "Taxation Act" to levy a tax on unearned increment as above indicated, but on further reflection we have not embodied that provision in the draft Act herewith submitted, having decided to recommend that the "Land Registry Act" be amended to carry out that purpose. We would suggest that such a tax be levied at a progressive rate, such rate to be the same percentage as the excess the vendor received over his equity in the property bears to that equity; such equity to be known as the "vendor's equity," and to be determined as follows:—

One-half of the sum of the assessed value of such property for the two years next preceding the date of sale plus 10 per cent. thereof, plus the value of any improvements made on or to the property between the time of the last assessment and the date of sale thereof: Provided, however, that no tax levied hereunder shall exceed 50 per cent. of the excess received by the vendor over his equity in the property.

In our former report we suggested that the rate placed on the increment be 5 per cent., but fuller consideration has led us to make the rate progressive, as above indicated.

In respect to the taxation of wild land and timber land from which timber has been cut and removed, or timber land whereon the timber has been destroyed by fire, we have made no change, but would recommend that the Assessor be careful in the valuation of such land, for if such lands have little value for agricultural purposes they should not be made to bear a tax above that value.

As indicated in our former report, we have made no provision for the taxation of personal property. In our investigations of taxation in other countries we find strong support for taking this course. In the United States, where the constitution of most of the States provides that real estate and personal property, usually known as "general property," shall be taxed at their full value and at the same rate, there is a strong effort being made in many States to have the tax on personal property abolished because, as we have pointed out, it imposes an unequal burden on the taxpayers, an inequality so extreme in many cases that it has led to all kinds of efforts being made to evade it, so much so that one writer has said that it had made nearly every man in his State a liar.

There is no part of our taxation system which works out so badly as this, and the provision in the present Act that gives the Government the alternative of taking the tax on the taxpayer's personal property or the tax on his income, whichever is the greater, only aggravates the injustice.

It may happen—in fact, we have evidence of such happenings—that persons doing business find at the end of the year their profit and loss account shows a loss, yet the tax on personal property calls for a large sum to be paid. This must be paid out of capital, a result that no system of taxation should bring about.

In the draft Act submitted herewith we have provided that the taxation of coal-mines be changed to bring the owners thereof under the income-tax provisions of the Act. We have done this for the reason, as we believe, that the present system is most unfair as between the owners of the different mines in that it takes, like the old tithe system, a fixed portion of the product without any consideration of the relative cost of producion as between one taxpayer and another. The measure of this injustice will be found by comparing the cost per ton of getting coal to the point of delivery for sale from the mine from which coal can be produced the cheapest, with the cost per ton of getting the coal to market from other mines whose output is produced under less favourable circumstances. The inequality in the incidence of taxation under the present Act no doubt discourages the working of mines that afford but a small margin of profit, and militates against the opening of new mines, which in the early days of development are unduly burdened by this method of taxation.

We have placed the value of coal lands, as such, for assessment at the price at which they can be bought from the Government—namely, $15 per acre. There is no practicable way by which an Assessor can determine the value of coal land as such, nor does the value of the surface give any index to that value. Therefore, to place these lands at an equal value for coal-mining purposes is probably as fair a way as can be followed for the assessment of such properties, the relative values of which can only be discovered by mining the coal. Although the relative value arising from difference of location might be considered as a reason for differentiation in assessed value, yet as this will be reflected in income and compensated for in the equalizing result of net income-tax, it need not be considered as important.

In providing for the taxation of mines other than coal-mines, we have followed the lines indicated in our former report; that is, to place in addition to a tax on the net income from the mine an initial tax on the net value of the ore in substitution for all the other taxes that might be levied—namely, a tax on the value of the surface of the land for the purpose for which it is used, a tax on the estimated value of the ore in the mine, and a tax on all the buildings, plant, and machinery used in or about the mine in connection with its operation. We have left out the alternative given to the Government by the present Act, to take a tax on the product of the mine or a tax on the income from it, whichever is found to be the greater. We submit that this method is wrong in principle and that it should not be followed, as it places an unequal burden on mine-owners in the comparative advantage to the mine with the richest ore and other favourable conditions as compared with other mines not equally favoured.

To put a fixed percentage tax on the net value of ore which costs 20 per cent. of its value to get it, and the same fixed percentage on the net value of ore that costs 80 per cent. of its value to get it, is so clearly inequitable that it has only to be stated to be condemned. Although the principle so condemned is applied in the draft Act submitted, its application to the extent provided finds justification in the fact that the tax so levied by it is in substitution for all the other taxes that might be levied, as above stated, as a real-property tax, and for the further reason that in the case of a struggling mine during the early stages of development it may be much less than those taxes would be for which it is substituted.

In the United States there is probably no subject of taxation which has aroused so much difference of opinion and controversy as the taxation of mines. This has arisen largely from the rigidity of the constitution of nearly all the different States, constitutions which crystallized into law the experience of a period when tangible property was taken as the sole evidence of the ability to pay taxes. The economic changes that have taken place since that time have created new conditions in which tangible property is not only incomplete evidence, but very misleading evidence as to where the "power to pay" is to be found. There is, therefore, in that country great effort being made to change this principle in taxation, and in many of the States some modifications have been made in that basic law. Yet few of them have got quite

free from that die-hard notion that all things having a sale value should be taxed on that value irrespective of their nature or use—not yet realizing that it is not the thing or means used in the production of wealth that should be taxed, but that it is the wealth produced that should be made bear the burden of taxation, as that is the only thing that gives the "power to pay."

Hence we find two impossible things attempted by Assessors there—one to value ore in the ground, the other to find out the amount of capital invested in some undertakings. The latter impossibility is stranger than the first, which arises from two causes—one of which is its amazing shrinkage if it is to be made the base of taxation, the other being its wonderful expansion if the interest thereon is allowed to be deducted before the income arising therefrom is charged with income-tax. The members of this Board have reason to think that no country in the world gives mine-owners a safer method of taxation than the one submitted herewith, for it practically imposes no taxes on them until their mines reach a productive stage.

The draft Act submitted provides for some changes in respect of the taxation of "certain corporations," all of which we believe to be in the direction of making the taxes on such more equitable, not only as between such bodies, but also in relation to other taxpayers. We cannot see how the present system, which provides for a tax on gross revenue of such dissimilar organizations as insurance companies and telegraph, telephone, and other public service corporations, can be reconciled on any common principle, the first drawing its revenue at a rate which by experience has been so fixed as to eliminate almost every chance of loss, and the second group using means of an ever-diminishing value and whose revenue must vary with the cost of material and labour. We have, therefore, for the above reasons, divided them in the Act on the lines indicated.

By bringing the fire insurance companies under its general provisions it will necessitate amending the "Fire Insurance Act," and so make all taxes that are not fees come through the taxing department of the Government. This Act will bring banks also under the income-tax provisions of the law. The provision in the present Act for taxing these institutions, which makes the levy upon them more in the nature of a licence than a tax, works out very unfairly as between bank and bank, and gives no certainty that they are paying less or more in proportion than other institutions which are deriving an income from the public. If more bank amalgamations take place, it will under the present system result in a shrinkage of the revenue from this source, and will likely render the inequality of the burden which now exists between bank and bank still more extreme. The revenue they would have to pay would likely be no more, as a whole, than they pay now. This may be assumed for the reason that the whole of the net profits of these institutions as shown by the latest statements is a profit of about $2.30 *per capita* for the whole population of Canada, which would give this Province about $1,000,000 as its share for taxation.

In regard to the taxation of railways, we have made no change in the provisions of the present Act. An examination of the data in the Canada Year Book showing earnings and expenses of the several systems in the Province—except that of the Canadian Pacific Railway Company, whose earnings in the Province are not separated from its total earnings—is not at all encouraging for an attempt to be made to get any revenue from a tax on their incomes. The Canadian Pacific Railway Company may be making considerable profit out of its operating in this Province, but we have no data to show how much. Even if that were known, any attempt to put an additional tax burden on that company, which holds a monopolistic position, might lead to increased rates being levied for their services that would be more loss than gain to the taxpayers of this Province.

In respect to the provisions recommended for the taxation of incomes, we wish to emphasize what we said in our former report in respect to deductions allowed and those that should not be allowed before income is charged with the tax. We submit that no deduction should be allowed for interest on borrowed money before the income is taxed, as it is contrary to the principle underlying the imposition of a tax on income.

Income-tax is a tax on the amount of wealth that the individual or economic unit draws out of the community, and the taxing power need not—should not—concern itself about the relative value of the means employed to get it, other than to allow that portion of such income needed to keep unimpaired the means used in the process of getting or earning it to remain free from taxation. Thus to the individual whose personal powers are his means for getting wealth there is enough of his income left untaxed to feed, clothe, house, and reproduce his kind; to

him and to all other units using additional means is allowed enough to make good the waste—diminishing value—of those additional means to be retained free of tax. But money has the unique quality or characteristic, unlike all other means that can be used, of not being subject to waste—not diminishing in value by its use; therefore nothing is needed to make good for waste by "wear and tear."

The above analysis shows that as to the wages paid to a man, or for the hire of a horse or a machine or for anything of diminishing value, which means are consumed in the using, there is the need of leaving that portion of the income of the economic unit employing them which is needed to reproduce them free from taxation, but that reason cannot be used to justify interest paid for the use of money, which is not consumed by its use, being allowed to escape taxation in the hands of the borrower before income-tax is levied on his income.

Until recently the English law did not provide for such allowance, but now it is allowed, provided the borrowing is for less than a year and from a bank doing business in the United Kingdom. The reason for the latter limitation is probably founded on expediency rather than justice. It is safe to infer that the decisions of the highest Courts in the Empire are what led up to the English law being amended. These decisions were based on the supposed fact that interest paid for the use of money in a business is similar in its effects in the economic process to money paid for the use of a machine, which, we submit, is not supported by a strict analysis of the fact. The fact that the law there provides for a higher rate of tax on unearned income points backward to support our conclusions, and a fuller analysis would show that to allow interest on borrowed money to be deducted from income before the tax is charged thereon is doing an injustice to the economic units which furnish their own capital.

As time goes on a closer analysis is being made of the relation of the economic units of a community to one another and to the community as a whole, which will lead to a more equitable distribution of the burden of the cost of government.

From the trend of thought as disclosed by leading writers on taxation, it must be inferred that net income is going to be made the measure of the ability of the economic unit to pay taxes, and before the application of this principle will vanish the claim for secrecy on the part of the individual as to the amount of the portion of the wealth created by the community he is drawing from them by his activities and power. The world is growing less and less inclined to look with patience on the claim of any one that this amount should be kept a secret from the other members of the community, a claim that his possessions are so sacred that no inquiry should be made to discover their value—an impatience that seems to grow in intensity in proportion with this growth; nor is the average citizen inclined to learn to appreciate the growth in the sensibility of the individual which, it is claimed by some, grows with his increasing wealth, and which makes him feel with increasing intensity the sacrifice he has to make in paying taxes in accordance with his power to pay them.

The intuitive recognition of the right of the community to take a portion of that which the individual has drawn from it, for the support of the Government, has found expression in many ways, and among the oldest of these is to put a tax on inheritance, which has been done by most nations. In the principle underlying the imposition of a tax on inheritance we find support and example for a tax on income. The tax on inheritance is a very crude and inequitable way to accomplish this purpose, but no doubt was applied in this way in the past because conditions were such as to make it very difficult to find out what the income of the individual was from year to year, but when death made it impossible for him longer to conceal the amount of his accumulations it was made easy for a tax of this kind to be levied.

The recognition of this social justice is now finding expression in most countries by the imposition of a yearly tax on incomes, and in following the example of the tax on inheritance is found justification for a tax at a progressive rate.

We do not recommend a higher rate to be levied on unearned income, because it leads up to a discrimination in respect of the means used to produce incomes, a discrimination that in many cases must be difficult to follow to a satisfactory conclusion, especially in a new country, and further because it is contrary to the true principle underlying the taxation of incomes.

Further, to levy a higher rate on the unearned income must lead up to a higher rate of interest being charged for the use of money in business, and thus give strength to the plea, otherwise unfounded, that interest on borrowed money should be deducted before income-tax is charged on profits.

The object this Board has had in view in drafting the Act submitted has been to provide that the revenue of the Province shall be drawn from two main sources—namely, a tax on land-values and a tax on income; and that the tax on the first shall correspond as closely as possible to the benefit such land receives from the work and presence of the community, including the owner, a benefit that should be measured by the increase in value given to such land as a means to produce wealth, the only true value land can possess. All other means used in the production of wealth we have intended to leave untaxed, leaving the tax on income to equalize the burdens of taxation among the taxpayers, which it will do if properly enforced.

In the draft Act submitted we have attempted to provide that all taxes levied on property values and income for the preceding year will become due and payable on May 1st of each year, that no rebate will be allowed on payment of any tax, and that interest will be charged on any tax not paid before the 1st day of July of the same year. This is in accordance with the recommendations set forth in our former report, and we think can be conformed to in practice. We have endeavoured to make simpler provisions in regard to the sale of land for taxes, and to make the tax-sale deed absolute and free from attack when it has been issued, after giving ample time for redemption and for attack of any defect in the tax-sale proceedings.

The members of this Board, after giving careful thought to the matter of submitting "a draft of proper provisions for the constitution of a permanent Board of Taxation," deem it inadvisable, with the limited knowledge they possess at present, to formulate such a constitution, but would submit as their opinion that if section 15 of the present "Taxation Act" be amended by striking out the word "Assessors" in the fourth line thereof, and substituting therefor the word "Taxation," it is all that is required in the circumstances; thus leaving with the Minister the power to determine from time to time, as occasion may require, the duties of such Board, which in the opinion of this Board should be advisory in respect of the Minister and supervisory in regard to the work of the Assessors and Collectors in the several districts of the Province.

All of which, together with the draft "Taxation Act" herein referred to, is respectfully submitted.

Dated at Victoria, B.C., the 11th day of February, 1919.

W. G. CAMERON,
THOMAS KIDD,
Board of Taxation.

DRAFT OF PROPOSED "TAXATION ACT."

An Act to assess, levy, and collect Taxes on Property and Income.

HIS MAJESTY, by and with the advice and consent of the Legislative Assembly of the Province of British Columbia, enacts as follows:—

Short Title.

1. This Act may be cited as the "Taxation Act."

Interpretation.

2. In this Act, unless the context otherwise requires:—

"Minister" means the Minister of Finance:

"Registrar of Titles," wherever used in this Act, shall include the Registrar-General and District Registrars of Titles; and registration, wherever herein in this Act required, is to be effected in the District Registry Office where the property is situated:

"Assessor" and "Collector" shall include Deputy Assessor or Deputy Collector for the district for which he is appointed:

"District" shall mean assessment district:

"Person" shall mean and include persons male and persons female, and also any and all companies, bodies corporate, corporations, firms, partnerships, general, special, and limited, syndicates, brokers, factors, associations, trustees, executors, administrators, guardians, agents, and receivers:

"Bank" shall include banking company, banking corporation, banking association, and savings-bank:

"Trustee" shall include executor, administrator, or guardian, committee, or receiver, the Official Administrator, and any person having or taking upon himself the possession, administration, or control of land or income affected by any express trust or having by law the possession, control, or management of the property or income of a person under any legal disability:

"Owner" means a person who holds a registered title of land in fee-simple or a tenancy for life, or being the holder of a registered agreement of purchase, and shall include the person through whom real property assessed and taxed is held liable for the payment of taxes levied against it:

"Taxpayer" means the person by whom or through whom taxes on real property or income or any other taxes levied by this Act are payable:

"Owner," in respect to a mine or mines, means the person owning, managing, leasing, or working the mine:

"Tax" and "taxes" shall extend to and include taxes on real property, wild land, coal land, timber land, income, and all other the several classes of property mentioned or referred to in and made liable to taxation by this Act:

"Land," "real property," and "real estate," respectively, means and shall include the land itself, and all buildings, structures, and permanent improvements or other permanent fixtures, machinery, or things erected upon or affixed to the land or to any building thereon, and all trees or underwood growing upon the land, land covered with water, and all quarries and substances, other than mines and minerals as hereinafter defined, in and under the land:

"Wild land" means all land, other than coal land and timber land, claimed by any person on whom there shall not be existing improvements to the value, when assessed, of two dollars and fifty cents per acre, in addition to the cash value of the land itself, on land situate west of the Cascade Mountains, and of one dollar and twenty-five cents per acre on land situated east of said Cascade Mountains; but improvements upon any part of the land owned or claimed by any person shall be deemed to be improvements upon the

immediately adjoining land of such person to the extent of one hundred and sixty acres on land situate west of the said Cascade Mountains, and of three hundred and twenty acres on land situate east of the said Cascade Mountains, in like manner as if such improvements had been equally distributed over the whole one hundred and sixty acres or three hundred and twenty acres respectively, except where the land of such person adjoining such improved lands are suitable only for pastoral purposes, and where the business of farming and stock-raising is jointly operated by him, in which case the value of the improvements shall apply towards exempting from the wild-land tax such adjoining pastoral lands: Provided, however, that where wild lands are situate within a radius of five miles from the boundary of an incorporated town or city which has a population of not less than five thousand persons, the quantity of wild land to be exempted from the wild-land tax shall be limited to forty acres to the assessed owner or occupier thereof. Lands subdivided as townsites into lots of two acres or less in extent, regularly surveyed and shown upon a plan thereof, duly registered, shall not be assessed as wild land:

"Coal land" means all land owned, leased, held under licence, claimed, or occupied by any person for the special purpose of mining coal therefrom, and which is not held or used for any other purpose:

"Timber land" means any holding of the land which in the opinion of the Minister of Lands is held in sufficient areas for the purpose of forestry within the provisions of the "Forest Act," which is owned or occupied under any Crown grant of the Province or is held under lease or licence from the Crown within the purview of the "Forest Act" by any person for the specific purpose of cutting or removing timber therefrom, or as an investment for the accruing value of the timber thereon, and for no other purpose, which contains milling or merchantable timber to the average extent of eight thousand feet to the acre west of the Cascade range of mountains and of five thousand feet to the acre east of said range to each one hundred and sixty acres, and which has been classified as timber land for taxation purposes under the provisions of this Act by the Assessor after he has received from the owner or occupier thereof the return and certificate of the Minister of Lands provided for in section — of this Act; and also all timber land held under lease or licence from the Crown not requiring classification for taxation purposes under this Act, but which the Minister of Lands considers to be timber land within the provisions of the "Forest Act." Timber land from which timber has been cut or removed shall be classed as wild land, unless and until improved as provided for herein in the definition of "wild land": Provided, however, that where land is being cleared of timber and underbrush for the purpose of making it fit for agricultural, pastoral, or commercial purposes by a bona-fide settler it shall not be classified as timber land:

"Mine" means and shall include any land in which any vein or lode, ore-body, or rock in place shall be mined for gold or other minerals, precious or base, except coal, and any natural stratum or bed of earth, gravel, or cement mined for gold or precious minerals, or stones, including all placer mines, creek, bar, dry, bench, hill, and precious-stone diggings from which gold and other precious minerals or precious stones or base minerals are dug, dredged, mined, or won:

"Mineral" or "mineral-bearing substance" means and shall include all valuable deposits of gold, silver, platinum, iridium, or any of the platinum group of metals, mercury, lead, copper, iron, tin, zinc, nickel, aluminium, antimony, arsenic, barium, bismuth, boron, bromine, cadmium, chromium, cobalt, iodine, magnesium, manganese, molybdenum, phosphorus, plumbago, potassium, sodium, strontium, sulphur (or any combination of the aforementioned elements), asbestos, emery, mica, and all mineral pigments:

"Ton" shall mean two thousand pounds avoirdupois, except in respect of coal:

"Cattle" shall include polled and horned cattle, horses, and mules:

"Income" means and shall include the amount earned, derived, accrued, or received from any source whatsoever, the product of capital, labour, industry, or skill, during the twelve months ending the thirty-first day of December immediately preceding the date of assessment, or during any portion of the said period, and shall include, without being specially defined or enumerated, all wages, salaries, emoluments, and annuities accrued or due for any purpose whatsoever, and all income, revenue, rent, or interest accrued

or due from bonds, notes, stock, shares of stock, debentures (including interest or dividends from the stock, bonds, or debentures of the Dominion of Canada, and of this Province, and of any municipality of this Province), and from real and personal property, and from interest on money lent, deposited, or invested, and from all indebtedness secured by deed, mortgage, contract, agreement, or account, and from all ventures, businesses, professions, offices, avocations, or employments of any kind whatsoever; and means and shall include all the rents, incomes, and profits of every business and every corporate undertaking, and every industrial, manufacturing, and business undertaking of every nature and kind whatsoever, however arising, received, gained, or acquired, subject nevertheless to the exemptions hereinafter in this Act defined: Provided that where any person has a method of accounting fixing a fiscal or business year ending on any other day than the thirty-first day of December, the Minister may, in his discretion, adopt such other day as the day from which to compute the income of such person for the preceding twelve months.

Division of Act.

3. This Act is divided into three parts, relating to the following subjects:—

PART.

I.—General Taxation of Property and Income:

II.—Taxation of Railways and Railway Subsidy Lands:

III.—Miscellaneous Matters.

PART I.

GENERAL TAXATION OF PROPERTY AND INCOME.

4. All real property and income within the Province shall be liable to taxation, and every person shall be assessed and taxed on his real property and income in accordance with the provisions of this Act, subject to the exemptions and provisions hereinafter mentioned and contained.

5. Lands in respect of which no Crown grant has issued, but which are held from the Crown by pre-emption or lease, or under agreement by the Crown to sell, grant, or convey, or are simply occupied, shall be liable (while so held or occupied or during the existence of such agreement) to taxation from the date of pre-emption record, lease, or agreement to sell, grant, or convey, or date of occupation (as the case may be), and the person holding a pre-emption record, lease or agreement of purchase from the Crown or otherwise in occupation of such land shall be held liable to pay taxes assessed and levied on such land and improvements thereon, but such taxation shall not in any way affect the rights of His Majesty in such lands.

6. The following persons and property shall be assessed and taxed specifically pursuant to the several parts of this Act governing the subject:—

(*a.*) Certain corporations:

(*b.*) Persons canning and curing salmon or other fish and by-products thereof, and persons manufacturing whale-oil or other by-products of whales or other sea animals:

(*c.*) Mines and minerals other than coal and coke:

(*d.*) Mining property held by Crown grant and not worked:

(*e.*) Railways and railway subsidy lands.

Exemptions.

7. The following property shall be exempt from assessment and taxation, that is to say:—

(1.) All property now vested, or hereafter to be vested, or held in trust for His Majesty, or now held, or hereafter to be held, as Dominion railway lands, and all lands to be conveyed to the Dominion Government under the eleventh section of the "Terms of Union," or otherwise, or held by His Majesty, or vested in any public body or body corporate, officer or person, in trust for His Majesty or for the public uses of the

Province; and also all property vested in or held by His Majesty, or any other person or body corporate, in trust or for the use of any tribe or body of Indians, and either unoccupied or occupied by some person in an official capacity:

(2.) When any property mentioned in the last preceding subsection is occupied by any person otherwise than in an official capacity, the occupant shall be assessed in respect thereof, but the property itself shall not be liable:

(3.) All lands used exclusively for public burying-grounds or cemeteries, not exceeding five acres, and the personal property and income derived from public burying-grounds and cemeteries, when such personal property and income are used wholly for burial purposes, but not otherwise:

(4.) Every public library, society, mechanics' institute, and other public literary, or scientific institution, and every public mining institute or society, with the land owned by and attached thereto, not exceeding one acre, and the personal property and income thereof, when such land, personal property, and income are used wholly and exclusively for the purposes and benefit of such public institutions, but not otherwise:

(5.) Every agricultural or horticultural society, with the land owned and attached thereto, not exceeding twenty acres, and the personal property and income thereof, when such land, personal property, and income are used wholly and exclusively for the purposes of horticulture and agriculture:

(6.) Every public university, normal school, manual-training school, school-house, Court-house, gaol, industrial school, industrial farm, lunatic asylum, house of correction, house of reformation, orphanage, orphan asylum, asylum for the blind, asylum for the deaf and dumb, institution for the reformation of fallen women, homes for the aged and infirm, public hospitals for the care of the sick, and isolation hospitals, when such institutions are supported in whole or in part by public donations, private charity, or by grants from the Province, and the land, personal property, and income of such institutions when such land, personal property, and income are used and devoted, after paying the necessary expenses thereof, wholly and exclusively to the benefit and purposes of such institutions, but not otherwise:

(7.) The property, real and personal, and income of fire companies used and applied for the prevention and extinguishment of fires when so used and applied, but not otherwise:

(8.) The personal property and income of the Governor-General of the Dominion, and the personal property and income of the Lieutenant-Governor of the Province:

(9.) The full or half pay of any one in His Majesty's Regular Army and Navy in actual service; any pension, salary, gratuity, or stipend derived by any person from His Majesty's Imperial Treasury, and all the personal property and income of any person in such Military or Naval services on full pay, or otherwise in actual service:

(10.) All pensions payable out of the public moneys of His Majesty's Imperial Treasury, or out of the public moneys of the Dominion, or of any Province thereof:

(11.) All property, real and personal, which is situate without the Province:

(12.) Land within the limits of any municipality:

(13.) Every public road, way, highway, and public square or park used exclusively for public purposes, but not otherwise:

(14.) So much of the income of persons as is provided for in this Act:

(15.) Homesteads under the Dominion "Land Act" and pre-emptions under the Provincial "Land Act" for two years from the date of entry or record and to the extent of five hundred dollars of the value thereof for a period of four years thereafter: Provided, however, that if a Crown grant is issued sooner than the expiration of such periods this exemption shall cease:

(16.) Timber and coal lands held under lease or licence from the Crown, in virtue of the "Land Act" or "Coal and Petroleum Act" of this Province, under which a royalty and rental is reserved, or under which a licence fee is reserved for the use of His Majesty, while so held, but not otherwise:

(17.) All property, real and personal, of a city or district municipality:

(18.) The ordinary income of local benevolent societies raised by means of dues and assessments from its members:

Division of the Province into Assessment Districts.

8. For the purposes of this Act, the Lieutenant-Governor in Council shall have power to divide the Province into assessment and collecting districts and to define the boundaries thereof, and from time to time to alter the boundaries of any district and create new districts.

Assessors and Collectors—Appointments and Duties.

9. It shall be lawful for the Lieutenant-Governor in Council from time to time to appoint such person as he shall think proper as Surveyor of Taxes and Inspector of Revenue, and in like manner to appoint a person as Deputy Surveyor of Taxes and Inspector of Revenue; also to create a Board of Assessors for the purpose of consulting and deciding upon the best methods to obtain correct and equitable assessments throughout the Province, and for any other business connected with the discharge of their duties; and to appoint Assessors and Deputy Assessors, Collectors and Deputy Collectors for the districts created; also to prescribe regulations for governing them respectively in the performance of their respective duties.

10. Every Assessor and Collector, before entering on the duties of his office, shall enter into a bond for the faithful performance of his duties.

11. Such bonds shall be given by the said Assessor or Collector in such sum and such manner as the Lieutenant-Governor in Council shall require in that behalf.

12. The Collector shall pay over monthly to the Deputy Minister of Finance all moneys received by him, and the Collector shall prepare and forward, on or before the first day of February of each year, to the Surveyor of Taxes and Inspector of Revenue a detailed statement of all arrears of taxes due at the thirty-first day of December immediately preceding the said first day of February, showing the land upon which arrears are due, the names of the persons assessed therefor, the amounts in arrear for income, and the names of the persons assessed therefor; and in each statement he shall show, in separate columns, the arrears due for each year.

13. The Assessor shall, on or before the fifteenth day of May in each year, prepare and forward to the Surveyor of Taxes and Inspector of Revenue a certified copy of his assessment rolls as finally revised at the Court of Revision.

14. The Assessors and Collectors shall obey all departmental rules and regulations which may from time to time be issued under this Act.

15. If an Assessor neglects or omits to perform his duties, the other Assessor, or other Assessors (if there be more than one for the same district), or any Assessor or Assessors appointed temporarily for the purpose, shall, until a new appointment, perform the duties, and certify upon his or their assessment roll the name of the delinquent Assessor, and also, if he or they know it, the cause of the delinquency.

16. If any Assessor or Collector, acting under this Act, makes any unjust or fraudulent assessment or collection, or wilfully and fraudulently inserts the name of any person who should not be entered, or fraudulently omits the name of any person who should be entered, or wilfully omits any duty required of him by this Act, he shall, upon summary conviction before any Stipendiary or Police Magistrate, be liable to a fine not exceeding five hundred dollars, and imprisonment until the fine be paid, or to imprisonment for a period not exceeding six months, or to both such fine and imprisonment, in the discretion of the Court.

17. If any Assessor or Collector wilfully omits to perform any duty required of him by this Act, and no other penalty is hereby imposed for the omission, he shall be liable to a penalty of five hundred dollars, to be recovered from him in any Court of competent jurisdiction at the suit of the Minister.

18. (1.) Every person liable to be assessed and taxed under the provisions of this Act shall make a return or returns to the Assessor as provided in the several parts of this Act. In each such return the person shall state an address to which all notices and other documents to be mailed or served under this Act may be mailed or sent. Printed forms for the purpose of this section shall be supplied by the Assessor to any person on request.

(2.) If a person liable to taxation hereunder is unable for any reason to make the return required by this section, such return shall be made by the guardian, committee, curator, tutor, or other legal representative of such person, or if there is no such legal representative, by some one acting as agent for such person, and in the case of the estate of any deceased person, by

the executor, administrator, or heir of such deceased person, and if there is no person to make a return under the provisions of this subsection, then by such person as may be required by the Minister to make such return.

(3.) The Lieutenant-Governor in Council may from time to time alter, amend, or vary the said form, and may demand such other information from the taxpayer as to the nature and value of the property and income liable to assessment, and the taxpayer shall supply the information required by the said form and demand. The Assessor shall not be bound to accept as correct any of the returns so made to him, but shall, in any case if he thinks it necessary or expedient, or if he suspects that any person who has not made a return is liable to taxation, make independent investigation as to the property and income of the taxpayer or person, and he shall make his own valuation and assessment of the taxable amount. If the Assessor requires further details and more explicit particulars and returns from any person or taxpayer, he may demand the same by notice in writing stating his requirements in general terms, and every person or taxpayer receiving such a notice shall be bound to comply with the terms thereof fully and completely and within fourteen days after receipt by him of such notice. The Assessor may personally or through an officer appointed by the Minister examine the books and accounts, and any documents or vouchers relating thereto, of the person or taxpayer.

(4.) The Minister may at any time enlarge the time for making any return.

(5.) No person employed in the public service of the Province shall communicate or allow to be communicated to any person not legally entitled thereto any information obtained under the provisions of this Act, except such information as is required by law to be shown on the assessment rolls, or allow any person not legally entitled thereto to inspect or have access to any written statement furnished under the provisions of this Act. Any person violating the provisions of this subsection shall be liable, on summary conviction, to a fine not exceeding two hundred dollars.

19. The returns shall be made and signed by the taxpayer or his accredited agent, and in the case of a corporation, association, or partnership, by the president, secretary, treasurer, member, or chief agent having a personal knowledge of the affairs of such corporation, association, or partnership; or, in any case, by such other person employed in the business liable or believed to be liable to taxation as the Minister may require. The Assessor may in any case require the correctness of such return to be verified by the statutory declaration of the person who signs the same.

20. It shall be the duty of every person assessable for property or income in any assessment district to give all necessary information to the Assessor in respect thereof.

21. The Deputy Minister of Lands and the Commissioner of Lands in each land district shall, on or before the first days of January, April, July, and October in each and every year, transmit, or cause to be transmitted, to the Assessor of each assessment district a correct list of all land within his assessment district which may have been recorded, pre-empted, leased, granted, or sold, or agreed to be leased or sold by the Crown, including Crown grants issued for mineral or placer claims, or leases thereof, which may have been issued during the last preceding three months. They shall also in addition thereto, on or before the first day of January in each year, furnish the Assessor with a complete list of all pre-emptions abandoned within his assessment district during the year previous thereto.

22. All Commissioners and other officers, clerks, and sub-agents of the Department of Lands throughout the Province, the Registrar-General, the District Registrars of Titles, Government Agents, Mining Recorders, Gold Commissioners, and other officers or agents of the Government of this Province shall, on the written request of the Assessor, furnish him, without any charge therefor, with such information as he may consider necessary for compiling and completing his assessment roll.

23. Every Registrar of Titles shall, on or before the first days of January, April, July, and October in each and every year, transmit to the Assessor in each assessment district a correct list of all transfers of land during the previous three months within the Assessor's assessment district, giving the date of transfer, the description of the land, the owner's name and address, and the value upon which the registration fees of the transfer is based.

24. In the event of any returns required under this Act to be made by the taxpayer containing any wilfully false or deceptive statement, or fraudulently omitting to give a full, true, and complete statement of the property and income of the taxpayer, the taxpayer making such

wilfully false or deceptive statement, or fraudulently omitting to give a full, true, and complete statement of his property and of his income, shall, in addition to the penalties hereinafter provided, pay to the Assessor the ascertained adjusted amount of the tax for the period covered by the said return, with one hundred per cent. added thereto, which added percentage shall be deemed a portion of the tax for the said period; and all the provisions of this Act shall, as far as applicable, apply to the said added percentage.

25. In every case where the taxpayer knowingly and wilfully makes any false or deceptive statement in any of the returns required by the Assessor under this Act, such person shall, on complaint of the Assessor, and upon conviction before any Stipendiary or Police Magistrate or Justice of the Peace, be liable to forfeit and pay a fine of not less than one hundred dollars and not more than five hundred dollars, or to imprisonment for a term not exceeding six months, or to both fine and imprisonment.

26. Every person who, without reasonable excuse, fails, refuses, or neglects to comply with any of the requirements of this Act in respect of returns or lists to be made under this Act, or who withholds any information necessary for ascertaining the true taxable amount of any mine, mineral, property, or income, shall, on summary conviction, be liable to a penalty not exceeding five hundred dollars for every such offence.

27. In every case in which any person makes default in furnishing any return required under this Act, or if the Assessor is not satisfied with the return furnished by the taxpayer, the Assessor may make an assessment in such sum as in the Assessor's judgment ought to have been charged under this Act, and the Assessor shall have power, at any time after the yearly closing of his assessment roll, to make a supplementary assessment roll, and to add to the assessed value of the property and income of any person in any year any property or income that may have been omitted from returns made to him, or that may have come to his knowledge as having been omitted from any return, or may not have been assessed; and thereupon the Assessor shall give notice thereof to the person assessed, and such person shall pay the tax upon the same, subject, however, to the taxpayer's right of appeal to the special Court of Revision and Appeal provided for in this Act.

ASSESSMENT OF REAL PROPERTY, COAL LANDS, AND TIMBER LANDS.

Returns to be made to the Assessor.

28. Every person being the owner of real property, including wild land, shall, for the purpose of aiding the Assessor to fully and correctly ascertain the value of such property, make, on or before the first day of September of each year, a return to the Assessor of the assessment district wherein such property is situated, on forms to be supplied by the Assessor on request by such owner, and such return shall contain a full, true, and correct statement of the value of the land or real property owned by him within the said assessment district at the date of such return.

29. Where the owner, lessee, or licensee of any coal land is mining coal therefrom and is using any part of the surface of such land in connection with the operation of such mines and the transportation of coal therefrom or for any other purpose, he shall furnish the Assessor with a return giving the value of all buildings, structures, improvements, fixtures, and machinery, and all other things attached to the land necessarily and actually used for the purpose of operating such coal-mine and coke-ovens (if any) thereon, or for any other purpose, and in such return he shall give the full value of the surface of such land for the purpose for which it is used: Provided, however, that railways used exclusively for the carriage of coal from the mines or material and workmen to and from the mines, if such carriage is free of charge, shall not be taxed.

30. Every owner, lessee, or licensee of coal lands from which coal is being mined shall, between the first day of July and the first day of September of each year, furnish the Assessor a return showing the number of tons of coal mined and taken from such land during the twelve months ending the thirtieth day of June preceding the date of such return, and in such return he shall designate and describe by the legal or other well-defined description an area consisting of a number of acres of such coal land, or coal land adjoining such coal land, equal to one-fifth of the number of tons of coal so mined and gotten from such land. The area so designated and described shall be classed as Class A coal land. All other coal land shall be classed as Class B coal land.

31. (1.) In addition to the return referred to in subsection (4) of this section which has to be made to the Assessor on or before the first day of June in each year, every owner of timber land shall furnish to the Assessor a certificate from the Minister of Lands, to be obtained on application by the owner from the Minister of Lands, showing that the regulations of the Department of Lands under the "Forest Act" concerning the prevention of fire and the scaling and marking of timber cut from said land have been complied with, and showing also that payment has been made to the Land Department of all charges authorized that year on that behalf, and that all royalties, taxes, and charges imposed under Parts VII. and XI. of the "Forest Act" have been duly paid by the owner to the Land Department.

(2.) Notwithstanding anything to the contrary in this Act, the assessed value of timber land for taxation purposes shall include in one item upon the roll the value of the growing timber thereon, as well as the value of the soil or land, and upon which values the tax shall be levied.

(3.) Where the growing timber upon timber land has been accidentally destroyed by fire and is usually known as "burned-over land," the land shall be assessed as "wild land," unless and until improved, as provided herein in the interpretation of "wild land," to take it out of that class.

(4.) Every owner of timber land shall furnish to the Assessor, on or before the first day of June in each year, a return of his timber land, giving in detail the legal or other well-defined description of each parcel, the acreage thereof, the average number of feet of merchantable timber to the acre thereof, and the cash value per acre of each parcel, together with a plan showing the exact acreage, locality, and description of the portion of such land from which timber has been cut or removed, and the value of the land from which the timber has been so cut and removed; and in the event of such return not being furnished the Assessor may assess the whole of such timber land as wild land.

Preparation of Assessment Roll.

32. The Assessor of each assessment district shall, between the first day of September and the thirtieth day of November of each year, prepare an annual assessment roll for the assessment and taxation of land and real property within his district, into which, after careful examination of the returns made to him by the owners thereof as hereinbefore provided, and from such other information as he may deem reliable, he shall set down the following particulars: The name and last-known address of every person having taxable property within the district, and shall set down opposite the name of each such person a description of the property assessable to such person and the class to which it belongs, whether "real property," "wild land," "coal land, Class A," or "coal land, Class B," or "timber land," and the assessed value of each such property and the amount of taxes levied against such property; and any other information that may be considered necessary by the Minister. Where any alterations of the completed roll are made at the Court of Revision and Appeal, such alterations shall be shown in red ink, and such roll, as revised at such Court of Revision and Appeal, shall be the completed roll for the recovery of the taxes shown thereon.

33. Any error, omission, or invalidity made or arising in the preparation of the assessment roll, or in any notice of assessment, may be corrected by the Assessor at any time before the sitting of the Court of Revision; and it shall be the duty of every person receiving a notice of assessment to advise the Assessor of any error, omission, or invalidity he may have observed in the assessment of his property, in order that the Assessor may correct the same. It shall also be the duty of every person, when requested by the Assessor, to furnish him with a correct legal description, for the purpose of assessment, of each parcel of land owned or occupied by him in the Assessor's assessment district.

34. Where any land has for the first time become liable to taxation by reason of its having been recorded, pre-empted, leased, or sold, or agreed to be leased or sold by the Crown, or by any railway company, between the first day of October and the thirty-first day of December in any year, the Assessor shall add such land upon a supplementary roll and assess the same for the year immediately following the said thirty-first day of December.

35. All the duties imposed upon the Assessor with respect to his assessment roll, and all the provisions of this Act relating to the assessment roll, shall, where applicable, apply to the separate or supplementary rolls.

36. (1.) Real property shall be assessed at its actual cash value in money. In determining the actual cash value of real property in money, the Assessor shall not adopt a lower or different standard of value because the same is to serve as a basis of taxation, nor shall he adopt as a criterion of value the price for which the said property would sell at auction, or at a forced sale, or in the aggregate, with all the property in the assessment district, but he shall value the property by itself, and at such sum or price as he believes the same to be fairly worth in money at the time of assessment. The true cash value of property shall be that value at which the property would generally be taken in payment of a just debt from a solvent debtor.

(2.) Where real property is held and used for agricultural, horticultural, or pastoral purposes, and is by the return made to the Assessor by the owner thereof shown to be of less value than is indicated by the average amount of income for the three years immediately preceding the date of such return, then the Assessor may increase the assessed value of such property to a value based on such income capitalized at eight per cent., or to a higher value if the Assessor has reason to believe the property has a higher value for the purpose for which it is used.

(3.) Where real property is being used for business or industrial purposes, and the land apart from the improvements thereon has a special value arising from its location or other natural advantages, making it favourable for the purpose for which it is being used, the rental value of which cannot be clearly separated from the rental value of the whole real and personal property employed in the business or industry, and the return made by the owner to the Assessor does not in the opinion of the Assessor place the true value on such real property, the Assessor may revalue the same, and shall take into consideration the location or value of such land in determining the value of the real property for the purpose for which it is used, and shall add thereto the full value of the improvements thereon at the time the assessment is made to make up the full assessed value of such real property. Where land is being used in connection with residence premises for pleasure-grounds or park purposes and the return of the owner to the Assessor does not in the opinion of the Assessor show the true value thereof, the Assessor shall assess such real property at its full value, based on the full value of the land and the full value of the improvements thereon at the time the assessment is made, to make up the full assessed value of such real property.

37. All coal land shall be assessed, as such, at the rate of fifteen dollars per acre: Provided always that where the surface of any land within an area owned or held as coal land is used for any purpose, named and set forth in section 29 of this Act, it shall be treated as real property, and shall be assessed and taxed as such in addition to the tax imposed on the land as coal land.

38. All real property lying or being within an assessment district shall be assessed and taxed in the assessment district in which the same is situated, subject to the exemptions in this Act.

39. Land and real property shall be assessed to the owner thereof: Provided, however, that when a person is assessed as trustee, agent, guardian, receiver, executor, or administrator, he shall be assessed as such, with the addition to his name of his representative character, and such assessment shall be carried out in a separate line from his individual assessment, and he shall be assessed for the value of the real and personal estate held by him, whether in his individual name, or in conjunction with others in such representative character, at the full value thereof, determined as in the last preceding section.

40. (1.) Where any real property is registered in the name of any person as the owner of an undivided interest in a parcel, the said owner shall be assessed for the undivided interest in such parcel belonging to him in the proportion which such undivided interest bears to the assessed value of the whole of said parcel. No separate assessment and no entry upon the assessment roll shall be made against undivided interests in a parcel of land where the undivided interests are in less proportion than one-eighth of the whole, and in the event of the undivided interests being in less proportions than one-eighth of the whole, the parcel of land shall be assessed in the names of the last registered owners of undivided interests in proportions of not less than one-eighth, and the taxes due thereon shall be payable by them, saving their right to recover from owners of undivided interests in less proportions than one-eighth.

(2.) Where the title to any land has become vested in His Majesty in right of the Province, subject to any estate or interest therein of any person, or where the title to any lands is vested in His Majesty and it appears that any person had, prior to the vesting of such title in His Majesty, acquired or had such a right, whether legal or equitable, to an interest in such lands as would be enforceable against a private individual if such title were vested in a private

individual, and that such person has such right though he may not have actually acquired such interest, it shall be lawful for the Assessor to assess the interest of such person or the right of such person to an interest in such lands by estimating the value of the whole of said lands at their cash value per acre, and the proportion thereof representing the value of the interest or of the right to an interest of such person shall be set down by the Assessor upon his roll.

(3.) No appeal shall lie to any Court whatsoever from the assessment by the Assessor of the interest or the right to an interest in such lands, except on one or both of the following grounds:—

(*a.*) That the assessment is excessive; or

(*b.*) That the person assessed has no interest in the lands assessed or in any part thereof.

(4.) The appellant shall, before his appeal is or can be heard, file with the Court or the Registrar of the Court appealed to an affidavit setting forth the interest which the appellant claims in the lands involved in the appeal.

(5.) If there be no appeal or if the appellant's appeal be dismissed, the assessment as made by the Assessor shall be binding on the person assessed and upon every person claiming by, through, or under him.

(6.) No Crown grant shall issue in respect of any such interest unless and until all the taxes appearing on the assessment roll as chargeable against such interest have been paid.

41. Land within any assessment district and lying outside the boundaries of any municipality which is divided into villa or suburban lots, or other subdivisions, shall, if a plan thereof is duly registered in the Land Registry Office or District Land Registry Office, be assessed and taxed to the individual owner of each subdivision or lot, and if a plan thereof be not so registered, the whole of the said lots or subdivisions shall be assessed and taxed as so many lots to the last registered owner of the land before it was so subdivided. The owner of the land so subdivided according to the registered plan thereof shall furnish the Assessor, when requested by him so to do, with a list of all lots sold by him, giving the name of the purchaser, the date of the purchase, and the price paid, or agreed to be paid, for the same, and the Assessor shall thereupon assess to each individual owner the lots so purchased, or agreed to be purchased, and the balance remaining unsold to the owner of such unsold portion of the said subdivision.

42. Where the assessed value of any piece, lot, or subdivision of land according to the assessment roll is so small that the amount of tax imposed under the rate fixed by law will not subject such piece, lot, or subdivision to the payment of a tax as high as one dollar, then the sum of one dollar shall be placed on the assessment roll as the tax against such piece, lot, or subdivision, and the Assessor shall value and assess each such piece, lot, or subdivision separately, and shall enter the same on the assessment roll as a separate item.

43. When any owner of a townsite or other subdivision of land assessed within any assessment district files and registers a plan thereof in the Land Registry Office, he shall immediately thereafter furnish to the Assessor of the assessment district in which the land is situate a copy, tracing, or blue-print thereof, for the information and guidance of the Assessor.

44. The provisions of this Act as regards the tax on real estate shall not apply to, nor shall taxes on real estate be assessed, levied, or collected on, real estate which is situated within the boundaries of any municipality.

Mode of assessing Incomes.

45. All income derived from real and personal property in the Province, and all income derived from any other source whatsoever or wheresoever brought into, received, earned, or got by any person, body corporate, trustee, agent, receiver, guardian, executor, or administrator in the Province, shall be assessed and taxed subject to the exemptions in this Act, and not otherwise specially assessed and taxed under this Act.

46. Every person having income in the Province, other than railway companies assessed and taxed under Part II. of this Act, shall, without any notice or demand, and on or before the first day of February of each year, make a return to the Assessor of the district, wherein such income is liable to be assessed and taxed, on the Form No. — of this Act, and such return shall contain a full, true, and correct statement of the income of the person making such return for the calendar year ending the thirty-first day of December preceding the said first day of February.

47. Every person receiving income from more than one assessment district shall make a return showing the full amount of his taxable income from all sources, and shall state therein the assessment district in this Province in which he elects to be assessed and taxed on such income, and shall forward, on or before the first day of February of each year, such return to the Assessor of the district so elected by him: Provided, however, that the certain corporations assessed under sections 53, 54, and 55 hereof for income shall make their returns to the Assessor of the Victoria Assessment District. Any person making a return required by this section shall not thereby be relieved from making the return required to be made to the Assessor of each district from which a part of the whole amount of the income of such person is received.

48. Every person when making a return of his income to the Assessor of the district in which the income is acquired shall furnish the Assessor with a correct list of those employees of the said person, each of whose income is at a rate that will exceed for the year the exemption for the class in which each such employee is placed by the provisions of this Act, and in the said list he shall state the amount paid by him to each employee within and for the year ending the thirty-first day of December preceding the date of such return.

49. The Assessors shall, from the returns so made or from such other information as they may be able to obtain, fix and determine the assessable and taxable income of every person in the Province.

Preparation of Assessment Roll for Income.

50. The Assessor of each assessment district shall, between the first day of February and the first day of April in each year, prepare an annual assessment roll for the assessment and taxation of income, into which, after careful examination of the returns made by those having income within the district and after careful inquiry from such sources as he may deem reliable, he shall set down the following particulars: The name and last-known address of every person having taxable income within the district, and set down opposite the name of each such person:—

(1.) The gross amount of income of such person for the calendar year preceding the date of assessment:

(2.) The amount of exemption allowed therefrom:

(3.) The net amount and class of such income:

(4.) The rate thereon:

(5.) The amount of the tax charged:

(6.) Any other information that may be required by the Minister.

51. For the purpose of ascertaining the amount of taxable income of every person, the Assessor shall allow as deductions from the income of such person the deductions specified in the Form No. — in the Schedule to this Act as they shall respectively apply to such person: Provided, however, that the deduction to be made under item 1 shall be determined as follows:—

(*a.*) From income of single persons, including widows, widowers, or divorced persons under seventy years of age without dependent children or other dependents incapable of self-support, eight hundred dollars:

(*b.*) From the joint income of husband and wife living together, or either, as a parent, with children under sixteen years of age, twelve hundred dollars; and an additional amount for each child under sixteen years of age and for each dependent incapable of self-support, two hundred dollars:

(*c.*) From the income of a single person over seventy years of age, one thousand dollars:

(*d.*) Where any person is using land for agricultural, horticultural, or pastoral purposes and his gross income derived from the use of such land is not less than two thousand five hundred dollars, the amount of the above-specified deductions, except under subsection (*c*) hereof, shall be reduced by forty per cent. thereof; and where the gross income of such person from such land is not less than one thousand five hundred dollars, the amount of the above-specified deduction, except under subsection (*c*) hereof, shall be reduced twenty per cent. thereof:

(*e.*) Where a person employs labour in the production of his income and finds board for his employees, he may add to the wages paid to such employees a sum equal to one-third of the amount so paid for wages, provided such one-third does not exceed one dollar per day for each such employee, and enter such increased amount as wages paid in the production of his income:

(*f.*) Where the reduced deductions as specified in subsection (*d*) of this section are made from the gross income of any person described therein, the reductions so made shall be in substitution for the value of all the food consumed by such person which he has produced on such land, or exchanged for other articles of food consumed by him.

52. No other deductions from the income, in order to arrive at the taxable income, shall be allowed to any person or taxpayer than those set forth in the said Form No. 7, and none of such deductions shall include any of the following items:—

(1.) Any debts or liabilities paid out of income in any one year, where such debts or liabilities were not actually incurred in producing the income of that year:

(2.) Any expenses or charges which ought, in the opinion of the Assessor, to be chargeable against the capital of the taxpayer and not against revenue:

(3.) Any loss or expense not incurred by the taxpayer in the effort to produce the income:

(4.) The cost and maintenance of the taxpayer and his family or establishment, or rent of house occupied by him:

(5.) Domestic or private personal expenses:

(6.) Taxes on real property, or on personal property, or on income, or any rate, levy, tax, or assessment whatsoever, whether imposed or made or levied by or pursuant to any Act of the Parliament of Canada or of the Legislature of British Columbia, except the municipal taxes and rates allowed to be deducted under the said Form No. —:

(7.) Any loss or expense recoverable under any insurance policy or contract of indemnity, or not proved to the satisfaction of the Assessor, or which in the opinion of the Assessor ought not to be considered a loss, outgoing, or expense incurred by the taxpayer in the production of the income:

(8.) Any income transferred from the gross income of the taxpayer to a sinking fund, contingent fund, reserve fund, or undivided profits:

(9.) Income derived from any source without the Province, if such income is brought into or used within the Province:

(10.) Any interest on borrowed capital from which an income is derived:

(11.) Capital spent on improvements or betterments, or on account of interest which such capital would have brought if invested:

(12.) For any expenditure of a capital nature:

(13.) For directors' fees, and for salaries of partners and of persons holding offices as directors, and for the salary paid the president, vice-president, and general manager of any company or body corporate: Provided, however, if a general manager is residing in this Province and is actually employed in carrying on the business of the company, a deduction for his salary not exceeding five thousand dollars per year may be made:

(14.) Any allowance for depreciation, except such amount for depreciation of vehicles, machinery, plant, and buildings used in the production of the income as may be allowed at the discretion of the Minister, not to exceed for any one year fifteen per centum of the actual and original cost of such vehicles, machinery, plant, or buildings.

Taxation of Certain Corporations.

53. All returns to be made by corporations named in sections 54 and 55 hereof shall be for the whole business carried on by them within the Province, including all their branches and agencies throughout the Province.

54. The following corporations, namely: Every telegraph company, every telephone company, every express company, every gas company, every waterworks company, every electric lighting company, every electric power company, every street-railway company, every trust company, every loan company, and every bank, shall, in addition to making a return in respect of any real property each such company may own to the Assessor of the district in which such real property is situated as required by this Act, make, without any notice or demand, a return to the Assessor of the Victoria Assessment District, on or before the first day of February in each year, showing the amount of revenue or income received by such company from all sources within the Province for the year ending the thirty-first day of December preceding the said first day of February, and such returns shall be accompanied by a certified copy of its "balance-sheet" and "profit and loss account" for the said year; and every corporation named in this section shall be assessed and taxed on its income from all sources under the same classification

and at the same rates as are other persons assessed and taxed on income under the provisions of this Act.

55. The following corporations, namely: Every life insurance company, corporation, and association, every insurance company other than a life insurance company, and every guarantee company transacting business in the Province, shall, in addition to making a return of any real property each such corporation may own to the Assessor of the district in which such real property is situated as required by this Act, make, without any notice or demand, a return to the Assessor of the Victoria Assessment District, on or before the first day of February of each year, showing the amount of revenue received for premiums for insurance and guarantees by each company within the year ending the thirty-first day of December preceding the said first day of February; also a return showing the amount of revenue received from all sources other than that from premiums above mentioned for the year ending the thirty-first day of December preceding the said first day of February, and such returns shall be accompanied by a certified copy of the "balance-sheet" and "profit and loss account" of such corporation in respect of the income derived from all sources, except premiums aforesaid, within the Province by such company for the said year; and every corporation assessed and taxed under this section shall be assessed and taxed on its income from all sources, other than that received for premiums as aforesaid, at the same rates and under the same classification as are other persons assessed and taxed on income under this Act, and shall be taxed on all revenue from premiums at the rate of two per cent.

Taxation of Canneries and Whaleries.

56. Every person carrying on the business of canning, curing, dry-salting, or preserving in ice salmon and other fish, in addition to making a return in respect of his real property to the Assessor of the district in which such real property is situate, shall, not later than the first day of February of each year, furnish to the Assessor of the Victoria Assessment District, on a form to be supplied by the Assessor, a return showing the number of pounds of salmon and other fish canned, cured, dry-salted, and preserved in ice, respectively, by such person during the year ending the thirty-first day of December immediately preceding the date of such return.

57. Every person carrying on the business of manufacturing oil from fish, whales, and other sea animals, in addition to making a return in respect of his real property to the Assessor of the district in which such real property is situate, shall, not later than the first day of February in each year, furnish to the Assessor of the Victoria Assessment District, on a form to be supplied by the Assessor, a return showing the number of gallons of fish-oil and whale-oil and the number of pounds of fertilizer, whalebone, bone-meal, and other products and by-products, respectively, manufactured and produced by such person during the year ending the thirty-first day of December preceding the date of such return.

58. All returns required to be made by the persons described in the foregoing sections 56 and 57 shall be for and include the whole business carried on by each such person in the Province, including all branches and agencies thereof, during the year, and each such person shall accompany each such return with a full, true, and correct statement of the income derived from all the business carried on during the year by such person, together with a certified copy of his "balance-sheet" and "profit and loss account" for the year ending the thirty-first day of December preceding the date of such return.

59. Under the heading of "Certain Corporations," such being named and defined in sections 54 and 55 of this Act, and under the heading of "Canneries, Fish-curing Establishments, and Whaleries," the Assessor of Victoria Assessment District, between the first day of February and the first day of April in each year, shall, for the purpose of assessing and taxing such corporations and persons defined in sections 56 and 57 of this Act for the calendar year preceding the said first day of February, prepare assessment rolls, in which he shall, from the information contained in the returns furnished by such corporations and persons, and from such other information as he may obtain from any other source, set down:—

(*a.*) The name and address of each such corporation:

(*b.*) The gross amount of income received during the year by such corporation for premiums and guarantees, less the amounts paid for reinsurance (if any) on business done within the Province during the year by such corporation:

(*c.*) The gross amount of income received during the year by such corporation from all sources other than premiums as aforesaid:

(*d.*) The name and address of every person above defined in sections 56 and 57 of this Act:

(*e.*) The number of pounds of fish of all kinds canned, cured, dry-salted, and preserved in ice by such person during the year:

(*f.*) The number of gallons of fish-oil and whale-oil produced and manufactured by such person during the year:

(*g.*) The number of pounds of fertilizer, whalebone, bone-meal, and other products and by-products manufactured from fish, whales, and other sea animals during the year.

TAXATION OF MINES AND MINERALS OTHER THAN COAL AND COKE.

Mode and Rate of Taxation.

60. Mines and minerals shall, for the purposes of taxation, be regarded as a separate class of property, and the assessment and taxation thereof shall be regulated by the provisions of this Act relating thereto.

61. It shall be the duty of the owner or manager of every mine, whether the same be a mineral claim, placer claim, mining leasehold, or other mining property from which ore, minerals, or mineral-bearing substances are being raised, gotten, gained, extracted, or produced, forthwith to notify the Assessor of the district of the fact that any such mine mentioned above is in active production, and from time to time to furnish the name and address of the manager or person to whom notices hereunder may be addressed, and thereafter all notices required hereby may be given by letter directed to such address; and the Assessor shall forthwith, from information received therefrom or from other sources, prepare a list or roll showing all producing mines in his district.

62. It shall be unlawful for any person to ship, send, take, or carry away, or permit so to be shipped, sent, taken, or carried away, from the mining premises wherefrom the same may have been raised, gotten, or gained, any ore, minerals, or mineral-bearing substances raised, gotten, or gained until the last preceding section has been complied with.

63. Every owner of a mine, other than a coal-mine, shall be assessed and taxed on his income as provided for in this Act for the taxation of incomes, and shall, in addition to the return or returns to be made by him for that purpose, make, on or before the first day of February in each year, to the Assessor of the district in which such mine is situated a return showing:—

(1.) The amount of ore, minerals, or mineral-bearing substances shipped or sent from or treated on the mining premises during the calendar year preceding the date of such return:

(2.) The amount of ore, minerals, or mineral-bearing substances shipped or sent from the mine during the calendar year preceding the date of such return:

(3.) The name of the smelter or mill and locality to which the same are sent:

(4.) The cost per ton for transportation to smelter or mill:

(5.) The cost per ton for smelter or mill charges:

(6.) The amount of ore, minerals, or mineral-bearing substances treated on the mining premises during the calendar year preceding the date of such returns:

(7.) The value of the ore shipped, exclusive of the charges for freight or treatment and cost of mining:

(8.) The value of the ore treated on the mining premises, exclusive of the charges for treatment and cost of mining.

64. The assessable value of ore and mineral-bearing substances, for the purposes of this Act, shall be the gross value thereof after deducting from such gross value the cost of transporting the said ore and mineral substances to the smelter or mill, and the cost of treating the same at such smelter or mill or on the mining premises, together with the cost of mining the same.

65. Every owner of an iron-mine shall, on or before the first day of February in each year, make to the Assessor of the district in which such mine is situated a return showing:—

(1.) The amount in tons of iron ore produced from such mine during the calendar year immediately preceding the date of such return:

(2.) The market value of such ore at the mine.

66. At any time after making an assessment, or accepting taxes, based upon a return or returns furnished pursuant to section 64 hereof, should the Assessor ascertain that the said

return is, or the said returns are, misleading, incorrect, or did not furnish sufficient information upon which to arrive at the correct amount at which the output of the mine in question should have been assessed for the period covered by said return or returns, the Assessor may, from such information as he may be able to obtain, notify the manager, or other person to whom notices may be addressed, of the additional amount payable in respect of the output of the mine for the said period, and require payment thereof, and such notice shall state the date of a special meeting of the Court of Revision and Appeal to be held not less than fourteen days after the date of said notice.

Appeal.

67. Any person who is dissatisfied with the amount claimed by the Assessor, acting under the last preceding section, may appeal to the Court of Revision and Appeal against the said assessment, and he shall be entitled to have the objection heard by such Court. The Court of Revision and Appeal shall have power to sit from time to time specially to hear and determine such appeals. The notice of appeal shall state the grounds of the objections in detail, and must be given by the person making the same within ten days from the date of the Assessor's notice.

Powers of Assessor to enter Premises.

68. (1.) For the purpose of determining the quantity and value of ore, minerals, or mineral-bearing substances for which any person is assessable, and either before the receipt of a return or after such receipt, it shall be lawful for the Assessor to enter upon any mining premises from time to time for the purpose of ascertaining the quantity of ore, minerals, or mineral-bearing substances raised, gotten, or gained from the said premises; and for this purpose the Assessor may descend all pits and shafts and use all tackle, machinery, appliances, and things belonging to the mine as he shall deem necessary or expedient, and he shall have free ingress and egress to, out, and over all buildings, erections, and vessels used in connection with the workings; and he shall from time to time be allowed to take from the said mining premises such samples or specimens as he may desire for the purpose of determining, by assay or otherwise, the value of the ore, minerals, or mineral-bearing substances being raised, gotten, or gained therefrom.

(2.) Every person liable to pay the tax imposed hereby shall keep upon the mining premises proper books of account of the ore, minerals, or mineral-bearing substances raised, gotten, or gained from the said mining premises, containing all particulars of weight and value, showing the smelter or reduction-work or other returns, or the amounts derived from the sale of such ore, minerals, or mineral-bearing substances, and other facts and circumstances necessary or proper for ascertaining the amount of the tax payable hereunder.

(3.) And no ore, minerals, or mineral-bearing substances raised, gotten, or gained out of any mining premises shall be removed therefrom until the weight and value thereof shall have been correctly ascertained and entered in the said books of account, to which books of account and to the returns above mentioned the Assessor shall have full and complete access for the purpose of examining the same, and taking copies thereof or extracts therefrom.

Penalties.

69. Any owner or manager of a mine making any wilfully false or deceptive statement in the return required by sections 63 and 65 of this Act shall be liable, on summary proceedings before a Stipendiary or Police Magistrate, or two Justices of the Peace, to a fine of one thousand dollars, and, in default of payment thereof, to imprisonment for a term not exceeding six months.

70. In the event of any return mentioned in the last preceding section containing any wilfully false or deceptive statement, the owner of the said mine, in addition to the penalty provided by the said section, shall pay to the Assessor the ascertained adjusted amount of the tax for the period covered by the said return, with one hundred per cent. thereof added thereto, which said added percentage shall be deemed a portion of the tax for the said period; and all the provisions of this Act with regard to the said tax shall, as far as applicable, apply to the said added percentage.

71. Any person failing to transmit the returns as provided in sections 63 and 65 of this Act or to furnish the information required by the Assessor shall be liable to the penalties imposed by sections 69 and 70 of this Act.

72. Every owner of a mine, other than a coal-mine, being the owner or lessee of the surface rights of the mineral claim or claims in which such mine is situate, and who is using or leasing for use for any other purpose than for buildings, structures, fixtures, and machinery and all improvements and things attached to the land necessarily and actually used for the purpose of operating such mine, shall, on or before the first day of September in each year, make a return to the Assessor of the district showing the value of the surface of such mineral claim or claims and the improvements thereon for the purpose for which the same are used, and the Assessor shall assess and tax such lands and improvements as real property.

73. The Assessor of every district in which a mine or mines other than coal is being worked shall prepare a separate roll, under the heading of "Assessment Roll," for the assessment and taxation of mines and minerals other than coal, and shall, on or before the first day of April of each year, from the returns made to him as herein provided, and from such other information as he may obtain from any other reliable source, set down:—

(1.) The name of each mine and name and address of the owner thereof:

(2.) The amount of ore or mineral-bearing substances extracted from such mine during the calendar year immediately preceding the date of assessment:

(3.) The gross value of such ore as shown by the smelter returns:

(4.) The net value of the ore shown after deducting cost of extracting or mining the ore from the ground, the cost of transportation of the ore to the mill or smelter, and the cost of smelting or treatment of same:

(5.) The amount in tons of iron ore produced from each iron-mine during the calendar year immediately preceding the date of assessment:

(6.) The market value of such ore at the mine:

(7.) And any other information the Minister may require.

74. There shall be levied and collected a tax of one per cent. on the net value of all ore as shown on the assessment roll for each year, except on iron ore, and there shall be levied and collected a tax of thirty-seven and one-half cents on each ton of iron ore as shown on the assessment roll for each year, and such taxes shall be due and payable on the first day of May in each year.

75. The tax levied by the last preceding section shall be in lieu of and in substitution for all taxes that might be levied under the provisions of this Act on the real property, buildings, machinery, and fixtures used in the operation of the mine, and for any railway or other means of transporting ore or material from and to the mine, provided such railway or other means of transportation is used exclusively for the carriage of ore, material, and workmen from and to the mine.

Taxation of Unworked Crown-granted Mineral Claims.

76. The Assessor of every district in which there is situate any Crown-granted mineral claim not producing ore shall prepare a separate roll for the assessment and taxation of the owners of such claims, in which he shall set down:—

(1.) The name and address of the owner of each such claim and the name of such claim:

(2.) The acreage thereof and the amount levied thereon:

(3.) And any other information required by the Minister.

77. There shall be levied and collected by every Collector appointed under this Act from the owner or occupier of every mineral or placer claim situate within his collecting district, of which a Crown grant shall have been issued, including Crown grants issued under the authority of an Act made and passed in the thirty-sixth year of Her late Majesty's reign, intituled "An Act to amend the 'Gold Mining Ordinance, 1867,' and the 'Gold Mining Amendment Act, 1872,'" a tax of twenty-five cents for every acre, and fractional part of an acre, of land conveyed by the grant, which tax shall be payable on the second thirtieth day of June immediately after the date of the Crown grant, and thereafter on the thirtieth day of June in each year: Provided, however, that if the owner of any such claim shall establish, to the satisfaction of the Collector, that the sum of two hundred dollars has been expended upon such claim in mining-development work during the year preceding the date when the tax becomes payable, then the said tax shall not be levied in respect thereof; and in order to entitle the owner to benefit by this provision

he must produce to the Collector a detailed statement showing the nature of the work performed and the amount expended upon the said claim, duly sworn to as true and correct before the Collector or a Justice of the Peace, and this statement must be filed with the Collector on or befort the thirty-first day of August in each and every year in which he claims exemption from the said tax.

78. The tax imposed by the last preceding section shall apply to all mineral or placer claims held by grant from the Crown in any part of the Province, whether the same be situated within or without the boundaries of any municipality; and in all cases where the said tax has been heretofore imposed, or collected, the taxation and collection thereof, and any proceeding taken for sale or forfeiture of the claim or claims for non-payment of the tax, are hereby ratified and confirmed, and the exemption specified in subsection (12) of section 7 of this Act shall not apply to the land included in the Crown grants of mineral and placer claims.

79. Any owner of adjoining Crown-granted mineral or placer claims, not exceeding eight in number of such claims, shall be allowed to perform in mining-development work during the year preceding the date when the tax becomes payable, upon any one or more of such adjoining claims, the full value, at the rate of two hundred dollars per claim, to entitle all of such claims to exemption in lieu of the tax; but subject, however, to the said owner producing to the Collector a detailed statement showing the nature of the work performed and the amount expended, duly sworn to as true and correct before the Collector or a Justice of the Peace, which statement shall be filed with the Collector on or before the thirty-first day of August in each and every year.

80. If the tax imposed by section 77 of this Act shall remain unpaid on and after the thirtieth day of June in any year, the same shall bear interest at the rate of nine per cent. per annum until paid, and the Collector shall, on or before the first day of August thereafter, mail to the last-known address of the owner and registered chargee of such mineral or placer claim a notice stating that the taxes on such claim have become delinquent, and that if not paid within sixty days from the date of such notice the said claim will be advertised and offered for sale at public auction on the first Monday in the following November, of which sale the Collector shall give a notice, in terms hereinafter mentioned, by inserting the same in one issue of the Gazette, and also four consecutive issues of a weekly newspaper, or in one issue a week for four consecutive weeks of a daily newspaper, if there be a newspaper published in his collecting district, or if there be no newspaper published in his district, then in a newspaper published in the next nearest collecting district; and the several publications of such notice shall be before the day of sale. No such notice shall be inserted in the weekly edition of a newspaper if the newspaper has a daily edition.

81. In the notice to be published by the Collector as aforesaid, he shall state the name of the registered owner (or if the Crown grant has not been registered, the name of the Crown grantee), the name and description of the claim, the amount of the unpaid taxes and interest thereon, the costs of advertising and other expenses, and the total amount due, and he shall state that if the total amount due is not paid before the day of sale the claim will be offered for sale by public auction.

82. The tax imposed by section 77 of this Act shall be payable to the Collector of the assessment district in which the claim is situate, and shall be payable in one sum upon the total acreage of the claim, and the Collector shall not receive any proportion of the said tax from any person on account of alleged divided or undivided interests or shares in the said claim, and unless the full amount of the said tax on the total acreage of the claim is tendered no receipt therefor shall be issued.

83. Upon the failure of any one of several co-owners of a mineral claim to contribute his proportion of the tax imposed thereon by section 77 of this Act, any other co-owner may pay the same, and shall thereupon have a right of action against such defaulting co-owner for the proportion of the tax payable by him; and any judgment recovered in any such action shall be deemed to be a judgment within the meaning of section 26 of the "Execution Act," notwithstanding the fact that the sum payable thereby is less than the sum of one hundred dollars.

84. The tax imposed by section 77 of this Act shall form a charge upon the said claim, and the person liable to pay the tax shall be personally liable for the amount thereof, and the Collector may, before offering the claim for sale, in the event of the tax being unpaid in any one year on the first day of October, proceed against the said person in a summary manner

before any Stipendiary Magistrate, Police Magistrate, or Justice of the Peace, who may adjudge the same to be paid; and in default of payment of the amount due, it may, together with costs of distress, be recovered by distress of the goods and chattels of the said person.

85. Any land included within the area of a mineral or placer claim which has been Crown-granted and which is not exempted from the payment of the tax imposed by section 77 of this Act, and which shall be used in whole or in part for any purpose other than for the purpose of mining, shall be treated as real property and be assessed as such in addition to the tax imposed by the said section 77.

86. Where the owner of an unworked Crown-granted mineral claim is also the owner of the surface rights thereof, such surface rights shall be assessed and taxed as real property, and not as wild land, and the tax thereby imposed shall be in addition to the tax imposed by section 77 of this Act, and all taxes heretofore imposed and collected upon unworked Crown-granted mineral claims, either under the said section 77, or upon the surface rights thereof, as wild land or as real property, shall be held to have been legally imposed and collected.

Sale for Delinquent Taxes.

87. (1.) On the day appointed for the public auction of the claim the Collector shall offer the same for sale at the upset price of the total amount due, and he shall sell the claim to the highest bidder.

(2.) If the purchase price shall exceed the upset price, the surplus shall be paid into the Provincial Treasury by the Collector, in trust for the owner of the claim.

(3.) In the event of there being no bidder, or if the price offered shall not be sufficient to pay the amount then due, the claim shall become absolutely forfeited to and vested in the Crown for the use of the Province at the expiration of twelve months from the date of such auction, unless the owner whose name or names appeared, or ought to have appeared, upon the advertised list at the date of such public auction, or his heirs, executors, administrators, successors, or assigns, or any one on his or their behalf and in his or their name, shall pay to the Collector, on or before the expiration of the said twelve months, the taxes, costs, and interest due upon the said claim at the date on which payment thereof is tendered to the Collector.

(4.) The said claim shall not be located under the provisions of the "Mineral Act" or the "Placer-mining Act," and shall not, for the said period of twelve months, be open for pre-emption under the provisions of the "Land Act."

(5.) If the taxes, costs, and interest due upon such claim have not been paid at the expiry of the said twelve months, it shall be absolutely forfeited to and vested in the Crown for the use of the Province, and the Collector shall forthwith issue a certificate in quadruplicate stating that the claim therein specified is absolutely forfeited to the Crown for unpaid taxes, and that the Crown grant thereof is thereby cancelled and void; and the Collector shall retain in his office one of the said quadruplicates and forward one of the said quadruplicates to the Registrar of the land registry district in which the claim is situate, one to the Deputy Minister of Lands, and one to the Surveyor of Taxes and Inspector of Revenue, and they shall each duly register the same in their respective records.

88. On the day of sale the Collector shall issue to the purchaser of any claim sold an interim receipt for the purchase money, in which he shall state that he has sold the claim to the purchaser at the amount declared at such sale, and that if the claim is not redeemed on or before the expiration of twelve months from the day of sale, as before provided, he will execute a deed of conveyance thereof to the purchaser, his heirs or assigns, immediately after the expiration of the said period for redemption, and for which deed the purchaser shall pay to the Collector a fee of ten dollars, which fee shall be paid into the Provincial Treasury.

89. When a claim has been sold at public auction for unpaid taxes and costs, it shall continue to be subject to the tax imposed by section 78 of this Act.

Redemption.

90. (1.) The owner of any claim which may be sold at the said public auction shall have the right to redeem the same, at any time on or before the expiration of twelve months from the day of sale, by tendering to the Collector the full amount due for which the said claim was sold, together with interest at the rate of twelve per centum per annum from the date of sale until the date of tendering payment thereof to the Collector, and the said owner shall also at the same time pay to the Collector any taxes which may have accrued due subsequent to the

date of such sale and interest thereon; and on such tender and payment being made, the Collector shall issue to such owner a certificate that the claim has been redeemed.

(2.) During the said period allowed for redemption, the said owner shall have the right of possession of the said claim as fully as before the said sale, subject, however, to the purchaser at the said sale having the right to protect the same from spoliation and waste during the said period.

91. The Collector, on receiving the tender for redemption, shall at once notify the purchaser that he has received such tender, and request him to return the interim receipt issued to him on the day of sale, and on receipt thereof the Collector shall pay to the said purchaser the amount of the purchase money and interest at twelve per centum per annum so received from the person redeeming. On receiving the said notice from the Collector that the claim has been redeemed, the purchaser shall have no further rights in the claim.

Notice of Forfeiture.

92. When any mineral or placer claim becomes subject to forfeiture to the Crown as hereinbefore provided, the Collector shall forthwith after the date of the public auction give notice to the owner of such claim whose name appeared upon the advertised list, and to all persons who at the date of such public auction appeared on the Land Registry Office records of the land registry district in which the claim is situate as the owners or holders of a registered charge upon the claim, stating that the claim will be absolutely forfeited to the Crown at the expiration of twelve months from the day of the public auction, unless the amounts due as aforesaid are sooner paid; and such notice shall be deemed to have been properly given if mailed to the address of such persons last known to the Collector.

Arrears to be kept distinct from other Taxes.

93. The Collector, when he makes up his assessment roll of assessed taxes each year, and on the certified copy thereof to be forwarded to the Surveyor of Taxes and Inspector of Revenue, shall attach to the said roll a complete list of all the unworked Crown-granted mineral or placer claims in his assessment district, and shall show thereon the amount of taxes due at the thirtieth day of June in each year upon each claim; but the said amounts shall be kept separate and distinct from assessed taxes, and the amounts that may be collected from time to time by the Collector for taxes on such unworked Crown-granted mineral or placer claims shall be accounted for separately in his monthly returns to the Treasury Department, and shall by the Auditor-General be shown as a separate source of revenue in the Public Accounts.

Respecting Surface Rights.

94. Where the surface right of any mineral claim is divided into townsite lots by a plan duly deposited in the Land Registry Office, or where the surface rights are owned or assessed separately from the mineral rights, the Collector may at the sale offer only the mineral under-rights in the Crown-granted mineral claim for sale; and in the event of a new Crown grant being issued to a tax purchaser, the title conveyed shall be limited to the mineral rights only, without any right to the surface.

95. Where any mineral claim situate in a municipality has, as aforesaid, been divided into townsite lots, and the mineral under-rights only have been sold and Crown-granted anew to the purchaser for taxes, it shall be lawful for the Lieutenant-Governor in Council to vest in such municipality any surface rights as to streets, lanes, and highways as shown on such townsite plan that previously appertained to such mineral claim, and which belong to the Crown.

Disposal of Forfeited Mineral Claims.

96. (1.) When a Crown-granted mineral claim has been absolutely forfeited to and vested in the Crown under the provisions of this Act, it shall be lawful for the Gold Commissioner for the mining division in which the claim is situated to grant a lease thereof to any person for the term of one year upon payment of the sum of twenty-five dollars, and, upon payment of a further sum of twenty-five dollars, to grant a renewal of the lease for a further term of one year commencing on the expiration of the former lease, but for no longer period.

(2.) There shall not be granted to any person a lease or any interest in a lease of more than two claims in the same mining division, and a grant of a lease or an interest in a lease in excess of the said number shall be void.

(3.) Such lease shall not be transferable.

(4.) Subject to the rights of any person to the surface or a portion of the surface of such mineral claim, the lessee shall, during the continuance of his lease, but not longer, have the right to enter, prospect, and mine upon such claim for all minerals, precious and base, save coal and petroleum, and for that purpose shall have all the rights of a free miner under the "Mineral Act."

(5.) When the Gold Commissioner has granted a lease to any such person, he shall forthwith notify the Surveyor of Taxes and Inspector of Revenue, giving the name of the claim, the name of the lessee, and the date of the lease, and the Surveyor of Taxes and Inspector of Revenue shall enter the particulars furnished him by the Gold Commissioner in a proper book to be kept by him for that purpose.

(6.) The lessee may, at any time before the expiration of his lease, apply for and obtain a Crown grant of such mineral claim upon payment of all taxes, costs, and interest which remained due and unpaid on such claim on the date of its forfeiture to the Crown, together with all taxes and interest payable in respect thereof from the date of the lease to the date of the application for a Crown grant, but without the payment of any fee for the Crown grant: Provided, however, that if the lessee shall establish to the satisfaction of the Gold Commissioner that he has expended upon such claim in mining development work a sum of not less than two hundred dollars a year during the continuance of the lease, then the tax from the date of the lease to the date of application for a Crown grant shall not be levied or collected.

(7.) The lessee shall be entitled to a Crown grant according to the acreage and description of the claim specified in the original Crown grant thereof under which the claim was held prior to the date of forfeiture, but subject to the prior rights of any other person.

What Taxes are to be assessed, levied, and collected, and Rates of Taxation.

97. There shall be assessed, levied, and collected from every person and paid to His Majesty, his heirs and successors, the sums following, that is to say:—

(1.) On Real Property.

One per cent. upon the assessed value of real property, other than wild land, coal or timber land:

(2.) On Wild Land.

Five per cent. upon the assessed value thereof:

(3.) On Coal Land.

One per cent. upon the assessed value under Class A coal land; four per cent. upon the assessed value under Class B coal land:

(4.) On Timber Land.

Three per cent. upon the assessed value thereof:

(5.) On Income.

On the taxable income of each person, when the amount thereof is ascertained under any of the following classes, the rates shall be as set forth in the respective classes, namely:—

CLASS A.—When the taxable amount of income of each person does not exceed two thousand dollars, upon all taxable income up to and including two thousand dollars, one per cent.:

CLASS B.—When the taxable amount of income of each person exceeds two thousand dollars and does not exceed three thousand dollars, upon all taxable income up to and including three thousand dollars, one and one-half of one per cent.:

CLASS C.—When the taxable amount of income of each person exceeds three thousand dollars and does not exceed four thousand dollars, upon all taxable income up to and including four thousand dollars, two per cent.:

CLASS D.—When the taxable income of each person exceeds four thousand dollars and does not exceed five thousand dollars, upon all taxable income up to and including five thousand dollars, three per cent.:

CLASS E.—When the taxable amount of income of each person exceeds five thousand dollars and does not exceed seven thousand five hundred dollars, upon all taxable income up to and including seven thousand five hundred dollars, four per cent.:

CLASS F.—When the taxable amount of income of each person exceeds seven thousand five hundred dollars and does not exceed ten thousand dollars, upon all taxable income up to and including ten thousand dollars, five per cent.:

CLASS G.—When the taxable amount of income of each person exceeds ten thousand dollars and does not exceed fifteen thousand dollars, upon all taxable income up to and including fifteen thousand dollars, six and one-half of one per cent.:

CLASS H.—When the taxable amount of income of each person exceeds fifteen thousand dollars and does not exceed twenty thousand dollars, upon all taxable income up to and including twenty thousand dollars, eight per cent.:

CLASS I.—When the taxable amount of income of each person exceeds twenty thousand dollars and does not exceed twenty-five thousand dollars, upon all taxable income up to and including twenty-five thousand dollars, ten per cent.:

CLASS J.—When the taxable amount of income of each person exceeds twenty-five thousand dollars, upon all taxable income, twelve and one-half of one per cent.:

(6.) Every person canning, curing, dry-salting, and preserving salmon and other fish shall pay an annual tax of ten cents on every one hundred pounds of such salmon or other fish canned, cured, dry-salted, and preserved in ice during each calendar year; and every person carrying on the business of manufacturing oil from fish, whales, and other sea animals and other products and by-products therefrom shall pay an annual tax of twenty cents on every one hundred gallons of fish and whale oil manufactured, and twenty cents on every ton of fertilizer, whalebone, and bone-meal manufactured by him during each calendar year.

Taxation of Cattle and Sheep depasturing on Crown Lands.

98. The owner or person in charge of any cattle or sheep which are brought into the Province from any place without the Province, and which are depastured on Crown lands, shall pay to the Collector in whose district they are found a tax of seventy-five cents per head on all cattle and a tax of twenty-five cents per head on all sheep so depastured, which tax shall become due and payable forthwith upon such cattle and sheep being depastured, and upon payment of the said tax the owner or person in charge of such cattle or sheep shall be entitled to depasture the same for a period of six months, but no longer.

99. Such tax, if not paid at the office of the Collector in whose district the cattle or sheep are found, shall be payable to the Collector on demand; and if then not forthwith paid, the Collector may, in addition to the powers conferred by section 146 of this Act, levy such tax by distress and sale of a sufficient number of such cattle or sheep to meet the tax and expenses.

Completion of Assessment Rolls.

100. The Assessor of each district, before the completion of each of the several rolls which he is by the provisions of this Act directed and instructed to prepare, shall transmit by post to or leave at the residence or place of business of every person whose address is known to him a notice of the sum or sums for which each such person is assessed and taxed on his "real property," "wild land," "coal land," and "timber land" in the Form No. in the Schedule to this Act, and the Assessor shall transmit by post or leave at the place of residence or business a notice to every person, whose name appears on any of the several rolls, of the sum or sums for which each such person is assessed and taxed on his income, and a notice of any other sum or sums for which he is assessed and taxed generally or specifically under the provisions of this Act in the Form No. in the Schedule to this Act or otherwise as the Minister may direct; and the Assessor shall enter on the roll, opposite the name of the person, the date of delivering or transmitting each such notice, which entry shall be prima facie evidence of such transmission or delivery, and on the back of such notice of assessment there shall be printed a brief summary, for the information of the taxpayer, of the dates when taxes are payable, delinquent, subject to sale or forfeiture, penalties, and any other particulars deemed necessary by the Minister.

101. The insertion by the Assessor of the letters "N.R." in the proper column of the roll, opposite the number on the roll of land assessed to "non-residents," or as "unknown," and the roll being open for inspection of taxpayers at the office of the Assessor for a reasonable time during office hours, shall be deemed to be legal and sufficient notice of assessment and of the amount due therefor to any non-resident whose address is unknown to the Assessor, or to any owner of land assessed as "unknown."

102. Every Assessor shall complete his roll for the assessment and taxation of "real property," "wild land," "coal land," and "timber land" in each year on or before the thirtieth day of November, and shall attach thereto a declaration signed by him, and verified upon affirmation in the form following:—

I, , of , Assessor of Assessment District, do solemnly declare:—

(1.) That I have, according to the best of my information and belief, set down upon the assessment roll all the real property, wild land, coal land, and timber land liable to taxation situate in the Assessment District of , and I have justly and truly assessed each of the parcels so set down at its actual cash value, as it would be appraised in payment of a just debt from a solvent debtor, as prescribed by law.

(2.) That I have set out the real property, wild land, coal land, and timber land in separate parcels upon separate lines of the said roll, as near as may be, and the nature of the tenure thereof.

(4.) I have entered thereon the names of all the owners of "real property," "wild land," "coal land," and "timber land," and of all other persons who have required their names to be entered therein, with the true amount of property occupied or owned by each, and I have not entered the name of any person whom I do not truly believe ought to be entered thereon; nor have I omitted the name or the property of any one whom I knew or had good reason to believe to be entitled to be entered therein, under any Act of the Province.

(5.) The date of delivery or transmitting of the notice required by section 100 of the "Taxation Act" is in every case truly and correctly stated in the said roll, and the amount for which each such person is assessed upon the said roll duly and correctly appears in the said notice delivered or transmitted to him as aforesaid.

And I make this solemn declaration conscientiously believing it to be true, and knowing that it is of the same force and effect as if made under oath and by virtue of the "Canada Evidence Act."

Declared before me at , on }
the day of , 19 . }

.....

103. Every Assessor shall, on or before the first day of April in each year, complete his roll for the assessment and taxation of income, his roll for the taxation of mines and minerals other than coal, and shall attach thereto a declaration signed by him, and verified upon affirmation in the form following:—

I, , of , Assessor of Assessment District, do solemnly declare:—

(1.) That I have, according to the best of my information and belief, set down upon the assessment roll for the assessment and taxation of income in this district the names of all persons who have income liable to taxation in this district.

(2.) That the said assessment roll contains a true statement of the aggregate amounts of the taxable income of every person named in the said roll, and I have estimated and set down the same according to the best of my information and belief.

(3.) That I have, according to the best of my information and belief, set down upon the rolls for the assessment and taxation of mines and minerals, other than coal, the names of all persons liable for the payment of taxes on ore extracted and taken from the mines within this district, and the said assessment roll contains a true statement of the aggregate amount of the tax levied against every person named upon the roll.

(4.) That I have, according to the best of my information and belief, set down on the assessment roll for the taxation of unworked Crown-granted mineral claims the names of the owners of such claims within this district, and that the said roll contains a true statement of the aggregate amount of the tax levied against every person named upon the roll.

(5.) The date of delivery or transmitting of the notice required by section 100 of the "Taxation Act" is in every case truly and correctly stated in the said roll, and the amount for which each such person is assessed upon the said roll duly and correctly appears in the said notice delivered or transmitted to him as aforesaid.

And I make this solemn declaration conscientiously believing it to be true, and knowing that it is of the same force and effect as if made under oath and by virtue of the "Canada Evidence Act."

Declared before me at , on }
the day of , 19 . }

.....

104. The Assessor of the Victoria Assessment District, before the completion of his roll which he is by the provisions of section 59 of this Act directed and instructed to prepare for the assessment and taxation of certain corporations, and for assessing and taxing persons carrying on the business of canning, dry-salting, and preserving salmon and other fish, and of persons carrying on the business of manufacturing oil from fish and whales and other sea animals and the products and by-products therefrom, shall transmit by post to or leave at the residence or place of business of every person, at his address last given by each such person, a notice of the sum or sums for which each such person is assessed and taxed as shown by and on said roll; and the Assessor shall enter on the roll opposite the name of such person the date of transmission or delivery of each such notice, which entry shall be prima facie evidence of such transmission and delivery; and on the back of such notice of assessment there shall be printed a brief summary for the information of the taxpayer of the dates when taxes are payable, delinquent, subject to sale or forfeiture, penalties, and any other particulars deemed necessary by the Minister.

105. The said Assessor of Victoria Assessment District shall, on or before the first day of April in each year, complete his roll named and described in section 59 of this Act, and shall attach thereto a declaration signed by him, and verified upon affirmation in the form following:—

I, , Assessor of the Victoria Assessment District, do solemnly declare:—

(1.) That I have, according to the best of my information and belief, set down upon the assessment roll for the assessment and taxation of certain corporations, and for the assessing and taxing of persons carrying on the business of canning, curing, dry-salting, and preserving salmon and other fish, and of persons carrying on the business of manufacturing oil from fish and whales and other sea animals and the products and by-products therefrom, the names of all corporations and persons who are liable to taxation under the provisions of sections 54, 55, 56, and 57 of this Act.

(2.) That the said assessment roll contains a true statement of the aggregate amount of the taxable income of every corporation and person named in the said roll, and I have estimated and set down the same and the amount of tax thereon according to the best of my information and belief.

(3.) That I have set down on the said roll, according to the best of my information and belief, the names of all corporations receiving income from premiums for insurance and guarantees, the gross amount of such income (less the amount, if any, paid for reinsurance by each such company), and the amount of tax thereon.

(4.) That I have set down the name of every person carrying on the business of canning, curing, dry-salting, and preserving in ice salmon and other fish, the number of pounds of fish so canned, cured, dry-salted, and preserved in ice by such person, and the amount of taxes thereon.

(5.) Also the name of every person carrying on the business of manufacturing oil from fish and whales, the number of gallons of oil so manufactured by him, and the tax thereon.

(6.) Also the name of every person manufacturing fertilizer, whalebone, bone-meal, or other product or by-product of fish, whales, and other sea animals, the number of pounds of each such product, respectively, and the amount of tax thereon.

(7.) The date of delivery or transmitting of the notice required by section of the "Taxation Act" is in every case truly and correctly stated in the said roll, and the amount for which each such person is assessed upon the said roll truly and correctly appears in the said notice delivered or transmitted to him aforesaid.

And I make this solemn declaration conscientiously believing it to be true, and knowing that it is of the same force and effect as if made under oath and by virtue of the "Canada Evidence Act."

Declared before me at , on }
the day of , 19 . }

.....

106. Any person liable to pay income-tax and any person whose returns have to be made to the Assessor of the Victoria Assessment District under the provisions of sections 54, 55, 56, and 57 of this Act, whose fiscal year is not the calendar year, may with the permission of the Minister make his return or returns to have the taxes payable by such person computed upon the basis of his income and products for the twelve months ending with the last fiscal year of such person preceding the date of assessment, and the Assessor shall govern himself accordingly.

Additional Powers.

107. Where necessary, under the provisions of this Act, for the Assessor to make a supplementary roll to any annual roll, he shall prepare such supplementary roll in accordance with the form of the annual roll to which it is a supplement, and shall add in a conspicuous place thereon the word "supplementary."

108. The Assessor may from time to time, either before or after a revision of the roll, or of any separate or supplementary roll in respect of any assessment or tax,—

(*a.*) Correct any clerical error:

(*b.*) Place thereon the name of any person of whose liability to taxation he is satisfied:

(*c.*) Add to any roll the value of any property or the amount of any income omitted to be assessed against or returned by any person at the time and in the manner required by law:

(*d.*) Place thereon the value of any property or the amount of any income owned, held, or received or receivable by any person or company which he is satisfied is liable to be assessed for taxation:

(*e.*) Place thereon the amount, or balance of any amount, of tax for which any person is liable, which has not been entered in any previous roll or which has not been previously demanded.

109. The Assessor shall, within ten days from the date of such amended assessment, give notice thereof to the person affected thereby; and every such person shall be entitled to object, and to have the objection heard before the Court of Revision and Appeal, which Court shall have the power to sit from time to time to hear and determine such objections and to deal with the amount of such assessment. Notice in writing of any such objection must be given by the person making the same to the Assessor within fourteen days from the date of the Assessor's notice, and in any action thereon or procedure thereto the provisions of section 94 of this Act shall apply.

110. Any additions, alterations, or changes, as provided in section 108 hereof, shall be reported by the Assessor to the Surveyor of Taxes and Inspector of Revenue, provided such additions, changes, or alterations have not been inserted in the roll before the final revision of the roll.

111. The assessment roll, completed and added up, with the Assessor's declaration and the certificate of the Judge of the Court of Revision and Appeal and of the Assessor attached, shall be deposited in the office of the Collector, and in such other place as the Lieutenant-Governor in Council shall in that behalf from time to time appoint, and at all convenient office hours, for a reasonable time, shall be open to the inspection of all the taxpayers resident, owning, or in possession of property in the assessment district.

Courts of Revision and Appeal.

112. The Lieutenant-Governor in Council may from time to time appoint three persons, who are residents of the assessment district for which they are appointed, to be a Court of Revision and Appeal in respect of the assessment of land and real property as aforesaid for such district, and such persons shall record the proceedings of the said Court and deposit such records with the Assessor. The person first named in such appointment shall be Senior Judge of such Court unless or until ordered otherwise by the Lieutenant-Governor in Council.

113. The Lieutenant-Governor in Council may from time to time appoint one or more persons in any assessment district to be a Court of Revision and Appeal in respect of the assessment of income and property other than land and real property as provided for in this Act, and such person or persons shall record the proceedings of the said Court and deposit such records with the Assessor.

114. Any Court so appointed may sit and adjourn from time to time at pleasure.

115. The said Court or some member thereof shall administer an oath or affirmation to every person or witness before his evidence can be taken, and may issue a summons to any witness to attend such Court.

116. If any witness so summoned fails to attend, he shall incur a penalty not exceeding twenty-five dollars, to be recoverable, with costs, before one or more Justices of the Peace in a summary way.

117. At the time or times appointed, the said Court shall meet and try all complaints in regard to persons wrongly placed upon or omitted from the roll, or assessed at too high or at too low a sum, and in regard to any error, omission, or invalidity made or arising in the assessment roll or in any of the proceedings leading up to or subsequent to the preparation of the roll.

118. Upon an appeal upon any ground against an assessment, the Court of Revision may reopen the whole question of the assessment, so that omissions from and errors and invalidities in the assessment roll, or in any of the proceedings leading up to or subsequent to the preparation of the roll, may be corrected, and the accurate amount for which the assessment should be made may be determined, and the person or persons who should be assessed therefor may be placed upon the roll by the said Court.

119. Provided always that when any owner of real property held and used for agricultural, horticultural, or pastoral purposes of not less than twenty acres in area, and which is assessed at a value of more than twenty-five dollars per acre, makes an appeal against the assessment made by the Assessor, and makes a sworn statement as to the value of the said real property based on its rental value, the Court of Revision may fix the assessment at any value over twenty-five dollars per acre which is based on its rental value capitalized at eight per cent.

120. When it shall appear to the Court of Revision that there are omissions from or errors or invalidities in the rolls or in any of the proceedings leading up to or subsequent to the preparation of the roll, and there is no appeal before such Court against the assessment in question, the said Court may extend the time for making complaints fourteen days further, and may then meet and determine the matter, and the Assessor may for such purpose be the complainant.

121. All the duties of the Court of Revision which relate to the assessment of real property shall be completed and the assessment rolls (except supplementary assessment rolls) finally revised by such Court on or before the twenty-first day of December in each year, or on or before such other day in every year as the Lieutenant-Governor in Council may from time to time appoint.

122. All the duties of the Court of Revision which relate to all assessment rolls, except that in relation to the assessment of land and real property, and except supplementary rolls, shall be completed and such assessment rolls finally revised by such Court on or before the first day of April in each year, or on or before such other day in every year as the Lieutenant-Governor in Council may from time to time appoint.

123. The proceedings for trial of complaints shall be as follows:—

(1.) Any person complaining of an error or omission in regard to himself, as having been wrongfully inserted on or omitted from the roll, or as having been undercharged or overcharged by the Assessor in the roll, may, personally or by his agent, within fourteen days after the date of mailing or delivery (if the notice has not been mailed) of the Assessor's notice of assessment as provided in this Act, give notice in writing to the Assessor that he considers himself aggrieved for any or all of the causes aforesaid, otherwise such person's right to appeal shall cease and the assessment made shall stand:

(2.) If any person who is assessed in or for the assessment district thinks that any other person has been assessed too low or too high, or has been wrongfully inserted on or omitted from the roll, the Assessor shall, on request of such first-mentioned person in writing, delivered to the Assessor within fourteen days before the date of holding the Court of Revision, give notice to such other person of the time when the matter will be tried by the said Court; and the matter shall be decided in the same manner as complaints by a person assessed:

(3.) The Assessor shall post up in some convenient and public place within the district a list of all the complainants, on their own behalf, against his return, and of all complainants on account of the assessment of other persons, stating the names of each, with a concise description of the matter complained against, together with an announcement of the time when the said Court will be held to hear the complaints, or to which it may be adjourned from time to time for that purpose; but no alteration shall be made in the roll unless under a complaint formally made according to the above provisions:

(4.) When it shall appear that there are palpable errors which need correction, the said Court may extend the time for making complaints fourteen days further, and may then meet and determine the additional matter complained of, and the Assessor may, for such purpose, be the complainant:

(5.) Such lists may be in the following form:—

Appeals to be heard at the Court of Revision at , on the day of , 19 .

Appellant.	Respecting whom.	Matter complained of.
A B.	Self	Overcharged on land.
C. D.	E. F.	Name omitted.
G. H.	J. K.	Not bona-fide owner or occupant.
L. M.	N. O.	Property undercharged.
etc.	etc.	etc.

(6.) The said Court shall also advertise in the Gazette and in some newspaper published in the district, and if there be no such paper, then in some newspaper published in the nearest district in which one is published, or by posting notice in some conspicuous place within the district, the time at which the Court will hold its sitting for the year, and the advertisement shall be published at least ten days before the time of such sitting:

(7.) The said Court shall prepare a notice in the form following for each person with respect to whom a complaint has been made:—

To J. K.:

Take notice that you are required to attend the Court of Revision at , on the day of , in the matter of the following appeal:—

H. G.,
Appellant.

Subject.—That you are not a bona-fide owner or occupant [*or as the case may be*].

Dated the day of , 19 .

(Signed.) *X. Y.,*
Judge of the Court of Revision.

(8.) Such notice shall be mailed to such address of the person as was last known to the said Court:

(9.) Every notice hereby required, whether by publication, advertisement, letter, or otherwise, shall be made at least ten days before the sittings of the said Court:

(10.) If the party assessed complains of an overcharge on his personal property or income, he or his agent may appear before the said Court and make a declaration, in case the complainant appears in person, in the Forms Nos. 10, 11, and 12 in the Schedule to this Act, according to the fact; and if the complainant appears by agent, such agent may make the declaration in the Forms Nos. 13 and 14 in the said Schedule, as the case may be; and no abatement shall be made from the value of personal property or income unless in accordance with the exemptions or deductions allowed by this Act; and the said Court shall thereupon enter the person assessed at such amount of personal property or income as is specified in such declaration, unless such Court shall be dissatisfied with the declaration, in which case the party making the declaration, and any witnesses whom it may be desirable to examine, may be examined on oath by such Court respecting the correctness of such declaration; and such Court shall confirm, alter, or amend the roll as the evidence shall seem to warrant:

(11.) In other cases the said Court, after hearing upon oath the complainant and the Assessor or Assessors, and any witness adduced, and, if deemed desirable, the party complained against shall determine the matter, and confirm or amend the roll accordingly; and in all cases before the said Court it may increase the assessment or change it by assessing the right person, the Court giving the latter or his agent fourteen days' notice of such assessment, within which time he must appeal to the said Court if he objects to such assessment:

(12.) If either party fails to appear, either in person or by an agent, the Court may proceed ex parte.

124. The said Court shall also, during its sitting, with or without notice, receive and decide upon the petition from any person assessed who declares himself, from sickness or extreme poverty, unable to pay the taxes for the then current year, or who, by reason of any gross or manifest error in the roll, as finally passed by the said Court, has been overcharged more than twenty-five per cent. on the sum he ought to have been charged for the previous year only. The said Court may remit or reduce the taxes due for such periods by any such person, or reject the petition.

125. All moneys to be assessed, levied, or collected under this Act for the public use of the Province shall, if not otherwise provided by any Act now or hereafter to be passed, be calculated, assessed, levied, and collected upon the assessments as shown on the several rolls prepared in accordance with the provisions of this Act, and as finally revised, and the Judge or Judges of each Court of Revision and Appeal and the Assessor of each assessment district shall, under their hands, certify to the correctness of the rolls for each such district.

126. Every roll, as finally passed and certified to by the said Judge or Judges of the said Court and the said Assessor, shall, except in so far as the same may be further amended on appeal to the Court of Appeal, be valid and bind all parties concerned, notwithstanding any defect, error, omission, or invalidity committed or existing in or with regard to such roll, or in or with regard to any of the proceedings leading up to or subsequent to the preparation of the roll.

127. When an assessment roll has been finally revised, the Assessor shall forthwith transmit to the Surveyor of Taxes and Inspector of Revenue a certified copy thereof, and in no case shall this transmission be later than sixty days after such final revision of the roll without the special consent of the Minister.

Special Courts of Revision and Appeal.

128. The person or persons appointed by the Lieutenant-Governor in Council under sections 112 and 113 of this Act may, on the request of the Assessor, hold special Courts of Revision and Appeal to hear and determine all appeals arising out of the assessment made by him under this Act, or out of any special, separate, or supplementary assessment rolls made by him in virtue of this Act; and notice of the holding of such special Courts of Revision and Appeal shall be given by the Assessor in one issue of the Gazette and in a newspaper published in the assessment district (if any) at least fourteen days before the holding of such Court; and the Assessor shall also give notice to the appellant at least fourteen days before the holding of such Court, of the time and place when and where the Court is to be held.

Appeal to Court of Appeal.

129. Notwithstanding anything contained in this Act, an appeal from the Court of Revision and Appeal shall lie to the Court of Appeal against any action or decision of the said Court of Revision, and also against any omission, neglect, or refusal of the said Court of Revision to hear or decide any matter. The notice of such appeal to the Court of Appeal, the time for bringing the same on and the procedure generally, and the powers of the Court of Appeal in respect of such appeal shall be the same as in the case of an ordinary appeal to the Court of Appeal from any judgment of a Judge of the Supreme Court. In addition to the powers above mentioned, the Court of Appeal shall have all the powers by this Act conferred upon the Court of Revision and Appeal.

Defects and Omissions.

130. If from any default or neglect an assessment roll for any year is incomplete, for the purpose of being finally revised by the Court of Revision and Appeal, it shall be lawful for the Lieutenant-Governor in Council to direct that the assessment roll for the year previous shall be taken and adopted in lieu of such incomplete roll.

131. If it appears to the Assessor that any land liable to assessment has not been assessed for all the year for which it was liable to assessment, he shall enter such lands upon the roll for the current year, or upon a supplementary roll for the current year, and assess such land for the years for which it is liable for assessment, but for which it had not theretofore been assessed, and at an assessed value equal to the average assessed value of the three previous years of land of similar nature and quality in his assessment district; and the taxes payable thereon shall be calculated for the whole period for which the land was liable to assessment, at the rate of taxes current for the year of assessment, and the said taxes shall be entered upon the roll in one amount, and which amount shall be considered as the tax due for the current year; and the Assessor shall mark upon the roll, and upon the assessment notice, immediately after the description of the land, that the tax shown due includes the taxes for the years omitted.

132. If, after the final revision of the current year's roll, the Assessor should discover that any person has escaped taxation (other than upon land), for which such person would have

been liable had he been assessed and taxed, he shall, upon a supplementary roll for the current year assess and tax such person for the amounts omitted, according to the information then had and obtained, but for a period limited to ten years preceding the date of such supplementary roll; and due notice of such assessment shall be given to such person, who shall have the right to appeal to the special Court of Revision at its next or some subsequent meeting after said notice of assessment has been given, and such appeal shall be lodged with the Assessor within fourteen days after the date of the notice of assessment. Before making such assessment, the Assessor shall have the right to examine the taxpayer on oath or otherwise, and to demand and obtain production of the taxpayer's books, papers, and accounts, and to examine the same. If after such examination it is proved that the taxpayer has wilfully evaded just taxation, or withheld correct information for the due assessment for which he would have been liable during any portion of the said period, the taxpayers shall be liable in the penalties mentioned in sections 24, 25, and 26 of this Act; but if the omission has been caused unintentionally by the taxpayer, he shall be liable for the correct taxes only, and he shall have no right to claim that all the taxes for which he had been assessed had been paid in full by any official receipts which he may produce, if the omitted amounts, or any balance thereof, are not included therein.

Payment and Collection.

133. All taxes assessed and levied under the provisions of this Act, except such taxes the date for the payment of which is otherwise specifically fixed and provided for herein, shall be due and payable on the first day of May in each year immediately following the year for which the assessment was made, and if not paid on or before the thirtieth day of June next following the said first day of May shall bear interest at the rate of nine per centum per annum until paid or received.

134. The person liable to pay the taxes imposed by this Act shall be personally liable for the amount thereof.

135. The taxes due upon any land, with costs and interest, may be recovered from the owner originally assessed therefor, and shall be a special charge on the land, having preference over every claim, privilege, charge, or encumbrance of every person except the Crown, and the charge and its priority shall not be lost or impaired by any neglect, omission, or error of the Assessor, or of any agent or officer, or by want of registration. Payment of taxes may be enforced against the person liable therefor by distress, as provided by section 146 of this Act, by action, as provided by section 191 of this Act, or by both distress and action.

136. Where any land upon which taxes are due to the Province has been included within the boundaries of any municipality heretofore created, or which may hereafter be created, or within any extension thereof, the Collector shall have the same powers for the recovery of such taxes, by public sale, by distress, or by action, conferred by this Act, as if the said lands had not been so included within such boundaries.

137. All taxes payable under this Act shall be payable at the office of the Collector appointed for the collecting district in which the same are due, and may be paid to the Collector either in gold coin, silver (to the extent only of twenty dollars by one person at one time), bank-notes issued by any chartered bank in Canada, marked bank-cheques, post-office money-orders, postal notes, or express orders; and where payment is tendered by cheque or orders, they shall be made payable to the Collector of the collecting district free of exchange, cost of remittance, or other charges; and the tax shall not be deemed paid, notwithstanding any receipt given therefor, until the amount of such cheque or order shall have been collected by the Collector.

138. In the month of May in each year the Collector shall, by advertisement or notice published in the Gazette and a newspaper, if there be a paper published in his district, and posted on the outer door of his office, give notice that the taxes are due and payable at his office. The publication of such notice in the Gazette shall be deemed to be equivalent to a personal demand by the Collector of all taxes due or payable by persons liable to pay the same.

139. The Collector of every district shall keep a triplicate blank receipt-book, and on receipt of any sum of money for taxes shall deliver to the party making payment one of such receipts, and shall transmit to the officer in charge of the Treasury the second of the set, with the corresponding number, retaining the third of the set in the book; the transmission of such

receipts shall be made to the officer in charge of the Treasury at least every month; and the officer in charge of the Treasury shall file such receipts.

140. In case there should be arrears of real-property tax, personal-property tax, or income-tax due by a taxpayer, and he should desire to pay off a portion of the said arrears before proceedings are taken for recovery thereof, the Collector may accept any amount tendered, but the amount so tendered shall in no case be less than one full year's tax, with interest thereon at the rate of nine per centum per annum to the date of payment; and the Collector shall apply the said amount to clear off the furthest back year or years in arrears (as the case may be), and grant a receipt therefor, and he shall state upon such receipt what amount is still due and owing by such taxpayer for real-property, personal-property, or income tax. If satisfactory proof is adduced to the Collector that any parcel of land on which taxes are due has been subdivided, and the plan of such subdivision duly registered in the Land Registry Office, he may receive the proportionate amount of tax chargeable upon any of the subdivisions, and leave the other subdivisions chargeable with the remainder, and the Collector may, in his books, divide any piece or parcel of land which may have been returned to him in arrear for taxes into as many parts as the necessities of the case may require.

141. The Collector shall, on demand, give to the owner of any land charged with arrears of taxes, or to any other person making application therefor, a written statement of the arrears, or that there are no arrears (as the case may be), at that date, and he may charge twenty-five cents for the search on each separate lot or parcel not exceeding four, and for every additional ten lots a further fee of twenty-five cents; but the said Assessor shall not make any charge for search to any person who forthwith pays the taxes.

POWERS AND PROCEDURE FOR ENFORCING PAYMENT OF TAXES.

Delinquent Taxes.

142. All taxes on real property, personal property, and income which became due on the first day of May in each year, remaining unpaid on the following thirty-first day of December, shall be deemed to be delinquent on the said thirty-first day of December.

143. All taxes which became delinquent at the date mentioned in the last preceding section shall thereupon bear interest at the rate of nine per centum per annum from such date until paid or recovered; such added interest shall be deemed a charge upon the property of the person whose taxes are delinquent, in all respects as if the said interest had originally formed part of the taxes assessed thereon, and may be recovered as a part of the delinquent taxes.

144. All taxes unpaid on the thirty-first day of December are hereby declared delinquent and shall bear interest at the rate of nine per centum per annum from that date until paid or recovered, and such added interest shall form a charge upon the property of the person whose taxes are delinquent, in all respects as if the said interest had originally formed part of the taxes assessed thereon, and may be recovered as a part of the said delinquent taxes; and any proceedings which may have been taken for recovery thereof under any Act of this Province heretofore in force, by public sale or otherwise, are hereby declared to be valid and of full force and effect.

145. The Collector, or any other person authorized by the Lieutenant-Governor in Council, is hereby fully authorized and empowered to sell property by public auction for taxes.

By Distress.

146. In case any person neglects to pay his taxes or any part thereof after demand or publication of notice as aforesaid, the Collector may, by himself or by his agent, levy the same with costs, by distress of the goods and chattels of the person who ought to pay the same, or of any goods and chattels in his possession, wherever the same may be found within the Province.

147. The Collector shall, by advertisement posted up in at least three public places in the district wherein the sale of the goods and chattels distrained is to be made, give at least ten days' public notice of the time and place of such sale, and of the name of the person whose property is to be sold; and at the time named in the notice the Collector or his agent shall sell at public auction the goods and chattels distrained, or so much thereof as may be necessary.

148. If the goods and chattels seized have been sold for more than the amount of the

taxes and costs, and if no claim to the surplus be made by any other person, on the ground that he was entitled by lien or other right to the property, such surplus shall be returned to the person in whose possession the property was when the distress was made and his receipt taken therefor.

149. If any such claim be made by the person for whose taxes the property was distrained, and the claim is admitted, the surplus shall be paid to the claimant and his receipt taken therefor.

150. If the claim is contested, such surplus money shall be retained by the Collector until the respective rights of the parties have been determined by action at law or otherwise.

151. (1.) If the Collector has not deemed it advisable to exercise the right of distress conferred upon him by section 146 of this Act, or in default of sufficient distress for the recovery of delinquent taxes, he shall, on a day to be fixed by the Minister between the fifteenth day of July and the fifteenth day of October in any year, levy all or any part of such delinquent taxes as the Minister may by any writing under his hand direct, together with all costs, interest, and charges, by sale of the lands in his collecting district of the persons liable for the said taxes.

(2.) To cover the costs of advertising and other expenses connected with the sale of Crown-granted mineral or placer claims or of lands for unpaid taxes, the Assessor shall charge each parcel of land advertised for sale with the sum of two dollars, and no more, and this sum shall be included in the column of the advertisement set apart for costs and expenses.

(3.) Where land has been subdivided into lots such as town lots, villa lots, and other small subdivisions, and where the same are advertised for sale for unpaid taxes, the charge of two dollars for advertising and costs mentioned in the last preceding section shall not be charged and added, but in lieu thereof the sum of one dollar shall be charged against each parcel as advertised to cover the costs of advertising and sale, and the Collector may in such advertisement include all the lots owned by one person in a particular subdivision in one parcel in such advertised list and offer the same for sale in one parcel.

152. In the case of lots in townsites, villas, or other small subdivisions of property, where taxes thereon are delinquent, they may, at the discretion of the Minister, be withheld from tax sale.

153. (1.) Subject to subsection (3), the lands of any member of the Allied Forces, as defined in section 2 of the "Allied Forces Exemption Act, 1918," shall be withheld from tax sale.

(2.) The lands of the father, mother, wife, or children of any such member of the Allied Forces, if dependent on him, may, at the discretion of the Minister, be withheld from tax sale.

(3.) This section shall not be deemed to in any way affect the power to assess or tax the property of any person under this Act; nor shall this section invalidate the sale of any land for taxes, or prevent the giving of a deed thereunder for any land sold where neither the Minister, nor the Assessor, nor the Collector has actual notice that any person having an interest in the land sold is entitled to the benefit of this section. In all notices of sale for taxes the Collector shall express his readiness to receive notice from any source of the interests of those entitled to the benefit of this section. Where, either by inadvertence or ignorance of the facts, lands of a person entitled to the benefits of this section are sold, the Minister may at any time prior to the delivery of the tax-sale deed cancel the sale in so far as it affects such lands, and refund to the purchaser the amount paid by him, with interest at six per centum per annum from the date of the payment; and thereupon the amount for which such lands were sold, together with interest from the date of sale, shall be and continue to be a lien upon the lands as if the tax sale had not taken place, and shall thereafter be deemed to be delinquent taxes within the meaning of this Act.

Procedure and Duties of Collector before and at the Sale.

154. (1.) The Collector shall cause to be published a notice of such tax sale as follows: By inserting in one issue of the Gazette and also in four consecutive issues of a weekly newspaper, or in one issue a week for four consecutive weeks (the same day in each week) of a daily newspaper, if there be a newspaper published in his collecting district, or if there be no newspaper published in his district, then in a newspaper published in the next nearest collecting district; and the several publications of such notices shall be before the day of sale.

(2.) In such notice the Collector shall state in several columns:—

(*a.*) The names of the assessed persons:

(*b.*) A short description of the properties of the assessed persons upon which the taxes are levied (which description shall be given as the lot, portion of lot, section, portion of section, block, township, range, group, or other division by which the land is commonly known):

(*c.*) The amounts of the delinquent taxes and interest to the date of sale:

(*d.*) The costs and expenses of such sale, including the costs of advertising:

(*e.*) The total amounts due; and

shall, subject to the provisions of subsection (3), further state that if the total amount due in any case be not sooner paid he will on a certain named date offer the property upon which the taxes are levied for sale at public auction.

(3.) In any case, if so directed by the Minister, the Collector shall also state in such notice that upon payment before the time of sale of such part of the delinquent taxes as may be directed by the Minister, together with interest thereon and the costs and expenses, the property upon which such taxes are levied may be withdrawn from sale.

(4.) In case any property is withdrawn from sale under subsection (3), such withdrawal shall not, nor shall any levy or any proceedings had for the sale of such property, affect or in any way prejudice the recovery of the part of such delinquent taxes remaining unpaid by any means or proceedings provided in this Act for the recovery of delinquent taxes.

155. It shall not be necessary for the Collector, when giving notice of the sale of land for unpaid taxes by advertisement or otherwise, to give in the said notice the full legal description of the land to be exposed for sale, but it shall be sufficient for the purposes of this Act for him to give in such notice a short description of such land; such short description shall be made so as to make the location of the land clear to the taxpayer and to the general public, and he shall not be required to state in such notice that the land is improved or unimproved.

156. It shall not be the duty of the Collector of any district to make inquiry before effecting a sale of lands for taxes to ascertain whether or not there is any distress upon the land, nor shall he be bound to inquire into or form any opinion of the value of the land; and if any tax in respect of the lands sold by the Collector in pursuance and under the authority of this Act shall have been due, and the land shall not be redeemed within the period herein allowed for redemption, such sale and the official deed to the purchaser of any such lands shall be final and binding upon the former owners of the said lands, and upon all persons claiming by, through, or under them, it being intended by this Act that all owners of land shall be required to pay the delinquent taxes and interest, costs, commissions, and all expenses due thereon within the time herein mentioned, or redeem the land within the period herein provided for.

157. (1.) If the taxes, interest, costs, and expenses have not been previously paid, or if no person appear to pay the same at the time and place appointed for the sale, the Collector may, at the place, day, and hour appointed sell the land of the assessed person as described in the said notice to the highest bidder.

(2.) The Collector shall offer each parcel of land as described in the said notice separately at an upset price, which upset price shall be the total amount due as set out in the third column of the said notice. In the event of there being no bid over the upset price, the person bidding the upset price shall be declared the purchaser.

158. If at any time appointed for the sale of lands the Collector should find it impracticable to finish the sale on the day appointed, he may adjourn the same from day to day until finished, but he shall not adjourn the same for a longer period than two days at one adjournment.

159. If the purchaser of any parcel of land fails immediately to pay the Collector the amount of the purchase money, the Collector shall forthwith again put up the property for sale.

160. Every purchaser, at the time of the sale and before he is given the certificate of sale, shall sign the tax-sale list, setting out his full name, occupation, and post-office address, and such list shall be preserved by the Collector with all the other books, documents, and papers connected with such sale.

Occupied Crown Lands not to be sold.

161. The Collector shall not sell any land the fee of which is in the Crown, but where taxes are delinquent thereon a final demand shall be made giving the pre-emptor, lessee, licensee, locator, or other person in whose favour a pre-emption, lease, licence, or location has been issued six months from the date when the said taxes have become delinquent, together with

the then current year's taxes, in which to pay such delinquent taxes and interest, together with the then current year's taxes, and notice that if not paid the pre-emption record, licence, lease, or location shall be cancelled; such final demand shall be made by the Collector on or before the first day of June in each year after the taxes become delinquent.

162. Failing payment of the delinquent taxes and interest, together with the then current year's taxes, by the pre-emptor, lessor, licensee, or locator within the said six months, the Collector shall forward to the Minister of Lands a detailed list of all defaulting pre-emptors, lessors, licensees, or locators, and the said Minister shall at once cancel the said pre-emptions, leases, licences, or locations: Provided, however, that if good reasons can be adduced to the satisfaction of the Minister of Lands that the defaulting person from poverty, sickness, or other cause has been unable to pay the amount due within the time limited, he may extend the time within which payment shall be made for a further period of six months before cancellation takes effect.

163. (1.) Until the Minister of Lands has notified the Collector that cancellation has taken place, the Collector shall not cancel the amount due upon his assessment roll or arrears-book, and he shall continue to assess the lands upon his roll until such notice of cancellation has been given.

(2.) The Minister of Lands shall, as soon as cancellation is made, notify the Collector of the fact, and the Collector shall then cancel the amount due, and leave off the assessment roll the property which has been so cancelled.

(3.) The Collector shall, within thirty days from the date of the notification of cancellation by the Minister of Lands, forward a detailed list of the lands and taxes cancelled on the Collector's rolls and books to the Surveyor of Taxes and Inspector of Revenue.

Procedure after Sale and Rights of Purchasers.

164. (1.) When a sale of land is made for unpaid taxes, the Collector shall give a statement in detail with each certificate of sale, showing the amount of taxes, interest, and costs included in the purchase price thereof, and if there is a surplus over the upset price realized he shall state the amount of such surplus thereon, and forward a copy of the certificate and statement to the Deputy Minister of Finance.

(2.) The Deputy Minister of Finance, on receiving such statement, shall place the said surplus to the credit of the person whose land was sold, and hold the same in trust for him until he redeems the land as hereinafter provided, or if he does not redeem the land within the period limited for such redemption, then such surplus shall be paid over to the said person, or his legal representatives, without interest.

165. When the Collector sells land for taxes, he shall within thirty days thereafter mail a letter, addressed to the person assessed on the roll, informing him of the name of the purchaser, the amount for which the land was sold, and the date on which the period allowed for redemption will expire, and the Collector shall also within six months after the sale of land for taxes give notice by letter, to any person or persons who at the time of the sale appeared on the Land Registry Office records as the owner or holder of a registered charge on or owning an equity in the land so sold, of the sale of the land and of the date on which the period allowed for redemption will expire; and such notice shall be deemed to be properly given if mailed to the last-known address of the person or persons above described to be notified by the Collector.

166. The Collector, after selling any land at public auction as aforesaid, shall give a certificate under his hand to the purchaser, describing the land sold as advertised, the sum for which it was sold, the costs and expenses, and the surplus (if any), and further stating that a deed conveying the same to the purchaser or his assigns will be executed by him, on the demand of the purchaser, at any time after the expiraton of two years from the date of sale, if the land be not previously redeemed, upon payment of the fee hereinafter provided.

167. The purchaser at such tax sale shall, where the land is not in occupation by the owner, his tenant, or any one entitled to redeem, on receipt of the Collector's certificate of sale, have all necessary rights of action and powers for protecting the same from spoliation and waste until the expiration of the term during which the land may be redeemed, but he shall not knowingly permit any person to cut timber growing upon the land or otherwise injure the land, nor shall he do so himself: Provided that the purchaser shall not be liable for damage done without his knowledge to the property during the time that the certificate of sale is in force.

Disposition of Surplus Proceeds of Sale.

168. In the event of there having been a surplus over the upset price at the time of the said sale paid by the purchaser, and which surplus stands to the credit of the person entitled to redeem upon the books of the Provincial Treasury, the Collector shall deduct the said amount so standing to the credit of the said person from the amount required by him for redemption, but without allowing interest thereon; and from the person so entitled to redeem the Collector shall accept the amount of the upset price, together with any taxes that may have been advanced by the purchaser during the period allowed for redemption, and together with interest at the rate of twelve per centum per annum on the said upset price, on the money advanced for taxes, and also upon the said surplus (which sums together represent the actual moneys paid by the purchaser).

169. In the event of there being no redemption, the said surplus shall be paid to the person entitled to redeem, or his legal representatives, without interest, on written application therefor to the Deputy Minister of Finance.

Result of no Sale being made.

170. (1.) If the Collector fails to sell any assessed property at such public auction or adjournment thereof at the upset price, or at a sum greater than the upset price, the assessed property shall become absolutely forfeited to and vested in the Crown for the use of the Province, free from all encumbrances, at the expiration of twelve months from the date of such public auction or adjournment thereof, unless the owner whose name appears on the advertised list at the date of such public auction, or a chargee, or the heirs, executors, administrators, successors, or assigns or either of them, or any one on his or their behalf, and in his or their name, shall pay to the Collector, on or before the expiration of the said twelve months, the following amounts, namely: the taxes, interest, and costs shown due upon the said advertised list on the said assessed property at the date of such public auction, with interest thereon to the date when payment is tendered, together with all taxes and interest accrued due subsequent to the date of such public auction, up to and including the date upon which payment is tendered.

(2.) During the said period of twelve months the said assessed property shall be assessed and taxed in the name of the person appearing on the said advertised list, and if payment of the amounts above set forth is not made to the Collector on or before the expiration of the said twelve months, he shall within one month from the expiry of the said twelve months issue a certificate under his hand, in quadruplicate, setting out that the assessed property mentioned therein had been publicly exposed for sale for delinquent taxes, and that no sale having been effected, and the amounts due being still unpaid, the assessed property is thereby absolutely forfeited to and vested in the Crown for the use of the Province, free from all encumbrances; and the Collector shall retain in his office one of such quadruplicates and he shall forward one of the remaining quadruplicates to the Registrar-General, or District Registrar of Titles of the land registry district in which the assessed property is situate, one to the Deputy Minister of Lands, and one to the Surveyor of Taxes and Inspector of Revenue, and they shall register the same in their respective records.

(3.) When the Collector has issued the said certificates he shall cancel upon his books the amount due upon such assessed property, marking thereon that the assessed property has been forfeited to the Crown.

(4.) Assessed property which has become subject to forfeiture as above provided shall not, during the said period of twelve months, be again advertised for sale for unpaid taxes.

171. In the case of lands where no sale has been effected at the public auction, and thereby becoming subject to forfeiture to the Crown as hereinbefore provided, the Collector shall, within one month after the date of the public auction, give notice in writing to the assessed person whose name appeared on the advertised list, and to each person who at the date of such public auction appeared on the Land Registry Office records of the land registry district in which the land is situated as the owner or holder of a registered charge upon the land, that the land will be absolutely forfeited to the Crown at the expiration of the said twelve months, unless the amounts due to the Province for taxes, interest, and costs on said land, as hereinbefore provided, are sooner paid; and such notice shall be deemed to have been properly given if mailed to the address of such persons last known to the Collector.

172. (1.) Lands which have been forfeited to and vested in the Crown under the provisions of this Act shall not be open for pre-emption under the "Land Act," nor for location under the "Mineral Act" or "Placer-mining Act," and such lands may be sold or leased by the Minister of Lands to any person at a price or rental not less than the price or rental of lands of similar nature and quality under the "Land Act," and upon such terms and conditions and subject to such reservations as he may consider right in the interest of the Province.

173. (1.) In the event of any land having been erroneously forfeited to the Crown, the Minister of Lands is hereby authorized and empowered to reinstate the assessed person, his heirs, executors, administrators, successors, or assigns, in the title under which the land was held at the date of forfeiture, free of all costs, but subject, however, to the payment by him or them to the Collector of all taxes and interest due upon the land at the date of forfeiture, and of a sum equal to the taxes which would have accrued due up to the time of reinstatement had the said land been regularly assessed at the same annual value as it appeared upon the assessment roll for the year previous to the date of forfeiture.

(2.) On production to the Minister of Lands of the Collector's receipts showing that the full amount required to be paid has been paid, the Minister of Lands shall cause the entry of forfeiture upon his records to be cancelled, and notify the said Registrar of Titles and Surveyor of Taxes and Inspector of Revenue to cancel upon their respective records the entry of forfeiture thereon.

Redemption.

174. The owner of any land which shall be sold for unpaid taxes, or his heirs, executors, administrators, or assigns, or any other person in his or their behalf, may, at any time within two years from the day of sale, redeem the land sold, by paying or tendering to the Collector, for the use and benefit of the purchaser or his legal representatives, the sum paid by him, including any taxes thereon advanced by the said purchaser since the day of sale, together with interest at twelve per centum per annum thereon; and the Assessor shall give to the party paying such redemption money a receipt, stating the sum paid and the object of the payment, and such receipt shall be evidence of the redemption.

175. Upon payment or tender being made for redemption of any land sold at public sale, it shall be the duty of the Collector to forward by registered letter to the last-known post-office address of the purchaser thereof at the said public sale a notice in writing stating that such property has been so redeemed, and that the amount to which he may be entitled out of the amount so paid in redemption shall be paid to him on production and delivery of the certificate of sale.

176. From the time of a tender to the Collector of the full amount of redemption money required by this Act, the said purchaser shall cease to have any further right in or to the land in question.

Pending Redemption.

177. During the period allowed for redemption, or until redeemed, the land shall continue to be assessed and taxed to the owner at the time the land was advertised for sale, and he shall be liable for the taxes thereon, and the same shall form a charge upon the land, and if he redeems the land the taxes accrued during said period of redemption shall be paid along with and at the same time as the amount required for redemption; and if the purchaser at the tax sale shall deem it expedient to pay the taxes which become due during the period of redemption upon the said land, he may do so, and in that event the amount so paid by him shall be added to the amount required to redeem the land.

178. In the event of any land being sold at a tax sale and not having been redeemed, the taxes accrued due during the period allowed for redemption shall, if unpaid at the time of the delivery of the deed to the purchaser, be paid by the said purchaser.

179. A purchaser at a tax sale shall have right to appeal from the assessment of the property purchased by him and to appear before the Court of Revision in support thereof, as if he were the owner of the property as recorded on the assessment roll.

Tax-sale Deeds.

180. At any time within the period allowed for redemption of land sold for taxes, the owner or any person holding a registered charge on or any one having an equity in such land may take

action by proceedings in the Supreme Court of this Province to have the sale of such land set aside upon any of the following grounds and no other:—

(*a.*) That the sale was not conducted in a fair or open manner; or

(*b.*) That the taxes for the year or years for which the land was sold had been paid; or

(*c.*) That the land was not liable to taxation for the year or years for which it was sold.

181. If any such sale be set aside or be declared invalid or any of the grounds set forth in the last preceding section, the Collector shall, within sixty days after the decision of the Supreme Court setting aside or declaring invalid such sale has been given, pay over to the purchaser of the land sold to him at such sale the full amount paid by such purchaser, with interest at the rate of nine per cent. per annum from the date of such sale to the date of such payment by the Collector; and if any such sale be set aside or declared invalid on the ground that such sale was not openly or fairly conducted, then and in such event the amount of the taxes and interest thereon for which such land was sold, together with interest on such taxes at the rate of nine per cent. per annum from the date of such sale, shall nevertheless be and continue to be a lien upon the land and shall be deemed to be delinquent taxes.

182. If the sale of land for taxes be not set aside or declared invalid for the reason:—

(*a.*) That the taxes for the year or years for which the land was sold had been paid; or

(*b.*) That the land was not liable to taxation for the year or years for which it was sold; or if

(*c.*) The land be not redeemed within the period so allowed for its redemption as aforesaid,—

then, on the demand of the purchaser, or his assigns, or other legal representative, at any time afterwards, and on payment of ten dollars, the Collector shall prepare, execute, and deliver to him or them a deed of the land sold, in which deed any number of lots in any one district may be included at the request of the purchaser or any assignee of the purchaser.

183. Such deed shall be in the Form No. 16 in the Schedule to this Act, or to the same effect, and shall state the date and cause of the sale and the price, and shall describe the land as herein provided, and shall vest in the purchaser all rights of property, in fee-simple or otherwise, which the person assessed, or those claiming under him, had in such land, and shall also purge and disencumber such land from all payments, charges, liens, mortgages, and encumbrances of whatever nature and kind other than existing liens for taxes, and other than the reservations and exceptions subject to which the person assessed, or those claiming under him, held the said land, and the Registrar-General or District Registrar of Titles, upon production of the deed and application in the usual form, and payment of the usual fees, shall register or record the same in the usual manner.

184. (1.) In any proceedings in any Court in this Province a deed purporting to be issued for a sale of lands for arrears of taxes, and purporting to be executed in the manner provided by this Act, shall be prima facie evidence that such deed is the tax-sale deed which it purports to be, and that the sale alleged in the said deed was conducted in a fair and open manner, and that there were taxes due and in arrear upon the land described in the said deed at the time of the sale for which the same could be sold.

(2.) In case any tax-sale deed is lost or destroyed, if the Collector of the assessment district in which the deed was prepared and executed is satisfied by affidavit or otherwise of the facts of the loss or destruction of the deed, the Collector may prepare, execute, and deliver to the purchaser at the tax sale, or his assigns or other legal representative, a confirmation tax-sale deed in lieu of the missing deed. The confirmation deed shall be a duplicate of the original tax-sale deed, with a recital added of the fact of the loss or destruction of the original tax-sale deed, and such confirmation deed when executed and delivered under this section shall in all proceedings in any Court in the Province and for all purposes of the "Land Registry Act" be of the same force and effect as if it were the original tax-sale deed. A fee of ten dollars shall be paid by the applicant to the Collector for a confirmation tax-sale deed.

185. A tax-sale deed shall, in any proceedings in any Court in this Province, and for the purposes of the "Land Registry Act," be conclusive evidence of the validity of the assessment of the land and levy of the rate, the sale of the land for taxes, and all other proceedings leading up to the execution of such deed; and notwithstanding any defect in such assessment, levy, sale, or other proceedings, no such tax deed shall be annulled or set aside.

186. The Collector shall, in all certificates and deeds given for land sold at a tax sale, give, as far as possible, a description of the part or proportion sold, with sufficient certainty, and if less than a whole lot or section, then by such a general description, as far as possible, as may enable a surveyor to lay off the piece sold on the ground; and he may search, if necessary, in the Land Registry Office to ascertain the description and boundaries of the whole parcel, and he may also obtain a surveyor's description of such lots, to be taken from the Land Registry Office or the Government maps where a full description cannot otherwise be obtained, such surveyor's fee not to exceed five dollars; and the charges so incurred shall be included in the account and paid by the purchaser of the land sold, or the party redeeming the same.

187. The Collector of each district shall enter in a book a full description of every parcel of land conveyed by him to purchasers for delinquent taxes, with an index thereto, and shall keep the same amongst the records of his office.

188. In any action brought by the Minister under this Act, it shall be sufficient if the action is brought by the Minister as plaintiff, and it shall not be necessary to name the said Minister, and the action shall not abate by reason of a change in the person of the said Minister, but the action may proceed as though no change had been made. In any such action the said Minister shall have the same right, either before or after the trial, to require the production of documents, to examine parties or witnesses, or to take such other proceedings in aid of the action as a plaintiff has or may take in an ordinary action.

189. In case of liquidation or insolvency of any person upon which a tax is levied under this Act, the amount unpaid of such tax shall be a first lien or charge upon the estate of such person in favour of the Crown for the benefit of the Province, subject to the provisions of any Statute of the Dominion and to the charges of liquidation and insolvency proceedings.

190. The taxes imposed by this Act upon every owner of a mine, both in respect to his income and in respect to the tax imposed on the product of his mine, shall constitute a lien in favour of the Crown, not only upon the output of the mine, but also upon the mine and mining premises wherefrom the same was extracted, and upon all ore, minerals, or mineral-producing substances extracted therefrom which may be on the premises. The Collector shall have all the like powers for collection by distress or by sale of the mining premises as are conferred by this Act for the recovery of taxes either upon real or personal property, and such powers may be exercised cumulatively.

General Powers applicable to all Cases.

191. If the taxes, or any part thereof, payable by any person cannot be recovered in any special manner provided by this Act, they may be recovered with interest and costs, as a debt due to the Crown, for the use of the Province, in which case the production of a copy of so much of the Collector's roll as relates to the taxes payable by such person, purporting to be certified as a true copy by the Assessor, shall be prima facie evidence of the debt.

PART II.

Taxation of Railways and Railway Subsidy Lands.

Interpretation.

192. Where the words following occur in this Part of this Act they shall be construed as follows unless from the context a contrary intention appears:—

"Company" means a railway company, and includes any person having authority to construct and operate a railway:

"Railway" means any railway which the company has authority to construct or operate, and includes all branches, sidings, spurs, and switches, stations, depots, wharves, rolling-stock, equipment, stores, property, real or personal, and works connected therewith, and also any railway bridge, tunnel, or other structure which the company is authorized to construct:

"Rolling-stock" means and shall include any locomotive, engine, motor-car, tender, snow-plough, flanger, and every description of car or of railway equipment designed for movement on its wheels over or upon the rails or tracks of the company.

Application of this Part.

193. This Part of this Act shall not apply to any real property of a railway company which is situate within the limits of any municipality in the Province.

194. This Part of this Act shall not apply to street railways operated by electricity within municipalities.

195. This Part of this Act shall not apply to railways used exclusively for the carriage or transportation of logs, ores, or coal, or of workmen employed by the owner of such logs, ores, or coal to and from their place of work, if they are carried free of charge.

Returns to be made by Companies.

196. Every company shall annually transmit, on or before the fifteenth day of October in every year, to the Surveyor of Taxes and Inspector of Revenue a return on forms to be supplied by him, showing:—

(1.) Under what Acts of the Province the company claims exemption from taxation upon its real and personal property and income, the date of the completion of the railway, the date of selection of the lands granted under any Acts of the Province, the dates of such grants and the acreage included therein:

(2.) The total number of miles of track of main line and branches, including sidings, spurs, and switches, of the railway company situated within the Province, and specifying the mileage claimed to be exempt from taxation under any Act of the Province and the mileage within the limits of any municipality in the Province:

(3.) Any other real property of the company liable to taxation other than that occupied by the company for its right-of-way or buildings connected with the actual operation of the railway.

197. (1.) Every company shall annually transmit, on or before the respective days hereinafter in this section specified, to the Surveyor of Taxes and Inspector of Revenue, returns on forms to be supplied by him, as follows, namely:—

(*a*.) On or before the fifteenth day of January in each year, a return showing all lands sold, agreed to be sold, pre-empted, or leased within the limits of the grants that are held by the company under any land grant or subsidy Act of the Province during the period of three months preceding the date of the return, namely, from the first day of October to thirty-first day of December:

(*b*.) On or before the fifteenth day of October in each year, a return showing all lands sold, agreed to be sold, pre-empted, or leased within the limits of the said grants during the period of nine months preceding the date of the return, namely, from the first day of January to thirtieth day of September.

(2.) Each of such returns shall show in detail and in tabulated form the legal descriptions of the land, number of acres sold or agreed to be sold, pre-empted, or leased, name of person to whom sold or agreed to be sold or leased, or by whom pre-empted, date of deed, agreement, pre-emption, or lease, and the consideration mentioned therein.

(3.) The lands mentioned in subparagraphs (*a*) and (*b*) of subsection (1) of this section shall be assessed and taxed as real property, or as wild land, coal land, or timber land, as the case may be, in accordance with the provisions of Part I. of this Act.

Penalty for failing to make Returns.

198. Every company failing to transmit the returns required by this Part of this Act shall be liable to a penalty of fifty dollars for each day during which failure, neglect, refusal, or delay in transmitting the said returns continues, to be recovered in a summary way by proceedings at the instance of the Minister before any Stipendiary Magistrate, Police Magistrate, or Justice of the Peace; and, in addition to such penalty, to the payment of all taxes which would have been payable under this Act had such returns been duly transmitted.

Rate of Taxation.

199. (1.) The land occupied and claimed as the right-of-way by any company and the railway with the personal property and income of the company derived from its railway, and its rolling-stock, shall be assessed and taxed as a whole as real property, the rate of taxation

to be two per cent. of the assessed value, and the assessed value shall be at the sum of ten thousand dollars per mile and fractions thereof of the track of the main line and branches of the company.

(2.) The measurement of the track of the main line and branches shall not include sidings, spurs, and switches, but all sidings, spurs, and switches of the railway shall be assessed and taxed as real property, and the assessed value thereof shall be at the sum of three thousand dollars per mile and fractions thereof.

(3.) In the event of the company erecting or having erected within or upon the land occupied and claimed as the right-of-way any building, structure, or portion of same, or other improvement which is used for other than railway purposes, such building, structure, or portion of same, or improvements, shall be separately assessed and taxed as real property, under the provisions of Part I. of this Act.

Liability of Companies.

200. Every such company shall be liable for the taxes levied under Part I. of this Act upon all the lands mentioned in section 197 of this Act, so long as the company is the owner of such lands, if such lands are not otherwise exempt from taxation under any Act of this Province, and the lands pre-empted, agreed to be sold or leased, mentioned in the said section 197, shall be assessed and taxed to the company as owner, and to the person named in the returns furnished by the company under the said section as occupant, jointly, under the provisions of the said Part I. of this Act.

201. Save as in this Part of this Act provided, the provisions of the other Parts of this Act governing the assessment, levy, due date, and proceedings for recovery of taxes on land and real property shall apply to the recovery of the taxes imposed by this Part of this Act.

202. The Lieutenant-Governor in Council is hereby empowered to grant to any railway company an exemption from the assessment and tax imposed by section 199 of this Act for a period not exceeding ten years from the date of completion of any railway which may be completed after the first day of January, 1908, and the date of such completion shall mean the date of the certificate of the Engineer of the Department of Public Works that the railway is open for traffic and passengers. A detailed statement of all such exemptions shall be submitted to the Legislative Assembly within the first fifteen days of each ensuing session thereof: Provided that such exemption shall only be granted on the express conditions—

(1.) That no aliens shall be employed on the railway during construction, unless it is demonstrated to the satisfaction of the Lieutenant-Governor in Council that the work cannot be proceeded with without the employment of such aliens:

(2.) That every exemption from taxation granted under this Act shall be subject to the conditions that the workmen, labourers, or servants employed in or about the construction and operation of the railway in aid of which such exemption from taxation is granted shall be paid such rate of wages as may be currently payable to white workmen, labourers, and servants engaged in similar occupations in the district in which such railway is constructed and operated.

PART III.

MISCELLANEOUS MATTERS.

Duties and Liabilities of Agents and Trustees.

203. Every agent for every person permanently or temporarily absent from or not resident in the Province, and every trustee:—

(1.) Shall be answerable for the doing of all such acts, matters, or things as are required to be done by virtue of this Act for the assessment of the property or income which he represents, or which is the subject of his trust, or which is received by him or comes to his hand, and for paying the tax in respect thereof:

(2.) Is hereby authorized to recover from any person in whose behalf he is compelled to pay any tax the amount so paid by him:

(3.) Is hereby authorized and required to retain, from time to time, in each year, out of any money which shall come to him in his representative character, so much as shall

be sufficient to pay the tax for the then current year when assessed therefor, and any arrears of taxes in respect of any property or income subject to such tax whilst acting as agent therefor, and is hereby indemnified for all payments which he shall make in pursuance of this Act:

(4.) Is hereby made personally liable for the tax payable in respect of any property or income if, while such tax remains unpaid,—

(*a.*) He shall alienate, charge, or dispose of such property; or

(*b.*) Dispose of any fund or money which shall come to him in his representative character;

and shall not be otherwise personally liable for any tax imposed upon him under this section.

204. The Collector, or any other person or authority empowered under this Act, shall have such and the like remedies against all land or other property of any kind vested in or under the control or management of any agent or trustee as he would have against the land or property of an individual, and in as full and ample a manner.

Failure and Inability to collect Taxes.

205. In case the Collector fails or omits to collect the taxes or any portion thereof, the Lieutenant-Governor in Council may authorize the Collector, or some other person in his stead, to continue the levy and collection of the unpaid taxes, in the manner and with the powers provided by law for the general levy and collection of taxes; but no such authority shall alter or affect the duty of the Assessor or Collector to return his roll, or shall in any manner whatsoever invalidate or otherwise affect the liability of the Collector or his sureties.

206. If any personal-property tax or income-tax shall become delinquent, and there is not any real property of the person owing such delinquent taxes upon which the same may be levied, or if there is no personal property belonging to such person which can be distrained therefor, or in default of sufficient distress, the Collector shall, within three months after the tax shall have become delinquent, forward to the Surveyor of Taxes and Inspector of Revenue a statement showing that every effort has been made to recover the tax, that there is no property or effects, or insufficient property or effects, or that the person assessed has left the country, and giving a detailed list of such irrecoverable taxes; and the Surveyor of Taxes and Inspector of Revenue shall, if he is so instructed by the Minister, cause the said taxes to be cancelled upon the books of the Collector.

207. Where taxes on land owned by the Crown, held under pre-emption or agreement, have become irrecoverable from the persons liable therefor, the Surveyor of Taxes and Inspector of Revenue may authorize the Collector to cancel on his books the amounts due therefor.

The Surveyor of Taxes and Inspector of Revenue.

208. It shall be the duty of the Surveyor of Taxes and Inspector of Revenue, and his deputy, under the direction of the Minister, to see that the provisions of this Act are carried out by the Assessors, Collectors, and taxpayers, and to prepare all rules, regulations, and forms necessary for that purpose, and the Surveyor of Taxes and Inspector of Revenue and his deputy shall have all the powers conferred upon Assessors under this Act.

Powers of the Lieutenant-Governor in Council.

209. It shall be lawful for the Lieutenant-Governor in Council in each year to cause to be paid to every person appointed under this Act such sums as he shall think fit for the purpose of carrying out the provisions of this Act.

210. In order to promote and facilitate the collection and recovery of taxes, and to give full and due effect to the meaning and intent of this Act or any amendment thereof, and of the Schedule of Forms to this Act, the Lieutenant-Governor in Council may from time to time make and discharge such rules and regulations as may, in his opinion, be necessary or desirable for carrying out the spirit, intent, and meaning of this Act in relation to matters for which no express provision has been made, or for or in respect of which only partial or imperfect provision has been made; or when the time limited for any act or step is insufficient, or where, by accident or otherwise, such act or step has not been taken, or it shall appear to the Lieutenant-Governor in Council that an alteration in dates is necessary or desirable, or where any proceeding under

this Act, or intended so to be, has been taken and failed, or if, in the opinion of the Lieutenant-Governor in Council, any ambiguity or difficulty shall arise in the construction of or in applying this Act, or if any change of practice, procedure, or method may be deemed desirable, the Lieutenant-Governor in Council may, by rules or regulations, from time to time make and promulgate such enlargement, extension, or alteration in times or dates as he may see fit; and any such rules or regulations shall be published in at least one issue of the Gazette, and shall have the force of law.

211. (1.) If any act, matter, or thing required by this Act to be made, performed, or done by the Assessor, Collector, or other officer appointed to carry out the provisions of this Act at or within a fixed time cannot be or is not so made, performed, or done, the Lieutenant-Governor in Council may, by Order, appoint a further or other time for making, performing, or doing the same, whether the time within which the same ought to have been done has or has not elapsed or expired.

(2.) Any act, matter, or thing made, performed, or done within the time prescribed by such Order in Council shall be as valid as if it had been made, performed, or done within the time fixed by or under this Act.

212. The Lieutenant-Governor in Council may make new forms or vary or alter any of the forms to this Act as the exigencies of the public service may render necessary.

Respecting Certificates of Improvements and Crown Grants.

213. The Minister of Lands shall not complete nor deliver, or cause to be delivered, any certificate of improvements or Crown grant under the "Land Act" until the person entitled thereto shall lodge with him a certificate from the Collector that all taxes due upon the land mentioned in the said certificate of improvements or Crown grant have been fully paid up to the end of the previous year.

214. The Collector shall, upon request of the person entitled to such certificate or Crown grant, furnish him, free of charge, with such certificate, stating that the taxes (if paid) have been paid.

General Provisions.

215. The forms of returns in the Schedule of Forms to this Act, when filled up by taxpayers, shall not be open for inspection by any person, except the Lieutenant-Governor in Council and the officers duly appointed under this Act, and by the Legislative Assembly of the Province.

216. Every roll shall be the property of the Province, and every Collector shall, upon application, deliver up the same to the Provincial Secretary, or some person authorized by him to receive the same.

217. If any person wilfully tears down, injures, or defaces any advertisement, notice, or other document which is required by this Act to be posted in a public place for the information of persons interested, he shall, on conviction thereof in a summary way before a Justice of the Peace having jurisdiction in the district, city, or town, be liable to a fine not exceeding fifty dollars, to be recovered in a summary manner.

218. All penalties recovered under this Act shall be paid to the Minister and shall form part of the Consolidated Revenue Fund.

LETTER OF TRANSMITTAL.

COLUMBIA UNIVERSITY, IN THE CITY OF NEW YORK,

December 31st, 1917.

J. B. McKilligan, Esq.,

Chairman, Taxation Board, Parliament Buildings, Victoria, B.C.

SIR,—I have the honour to submit to you for the consideration of the Taxation Board and the Government a report entitled "A Brief Account of the Revenue Situation in the Province of British Columbia, with some Comments and Suggestions," which was prepared from material gathered during my recent visit to the Province.

Very truly yours,

ROBERT MURRAY HAIG.

PREFACE.

During the summer of 1917 the writer received a communication from the Honourable H. C. Brewster, Premier of the Province of British Columbia, stating that he was about to appoint a Taxation Board which would attempt to place the revenue system of the Province upon a more satisfactory basis. Correspondence followed, which resulted in an invitation extended through the Honourable John Hart, Minister of Finance, to act as adviser to the Taxation Board and to the Government in connection with the proposed changes in the tax law.

The situation was felt to be so acute as to make an immediate investigation imperative. Through the kindness of President Nicholas Murray Butler and Professor J. C. Egbert, Director of the School of Business, the writer secured a brief leave of absence from duties at Columbia University and arrived at Victoria on November 6th, remaining three weeks, until November 27th. A cursory examination revealed a situation so full of difficulties and complications as to preclude the possibility of accomplishing in the time available more than a preliminary survey. It was decided, however, that the work should proceed, even though it was hopeless to expect that it would be carried to the point where a definite and comprehensive set of conclusions and recommendations could be formulated. This explains why this report is more a fragmentary outline than a definite statement giving the results of an exhaustive survey.

The pressure of time made it impossible to travel about the Province investigating first-hand the conditions of administration and the effects of the present distribution of the tax burden. Much valuable information, however, was presented at the hearings held at the Parliament Buildings in Victoria on November 21st, 22nd, and 23rd, which the writer had the privilege of attending. Except for these three days, the period was consumed in the study of documentary material and in conferences with the members of the Taxation Board, members of the Government, and various Provincial officials.

To Mr. John B. McKilligan, who for so many years has guided the development of taxation in the Province and who was honoured by being made Chairman of the Taxation Board, the writer desires to acknowledge a debt of gratitude. In spite of the heavy pressure of duties in his office, he gave with great generosity his time and effort to this investigation; without the aid of his exhaustive and accurate knowledge of the history and the application of the tax law, it may be frankly stated that progress with this study would have been most discouragingly slow. To the Minister of Finance, to the members of the Taxation Board, and to the many persons in the various departments who kindly assisted him in gathering material, the writer extends his hearty thanks. Finally, he would express his appreciation of the generous interest taken in the problem by Professor Edwin R. A. Seligman, of Columbia University, with whom the writer has had the great privilege of conferring.

A BRIEF ACCOUNT OF THE REVENUE SITUATION IN THE PROVINCE OF BRITISH COLUMBIA.

SOME ASPECTS OF THE GENERAL FINANCIAL SITUATION IN THE PROVINCE.

The Desirability of a Definite Formulation of Financial Needs.

Little progress can be made in the direction of a satisfactory solution of the taxation problem of British Columbia until knowledge has been secured of the fiscal needs of the Province and a definite financial plan adopted. This is because the size of the sum which must be raised by levying taxes has a profound effect upon the type of taxation which is best suited to the circumstances. It happens that in British Columbia at the present time the exact determination of the amount to be raised by taxation is an unusually difficult and delicate task. Not only are conditions so uncertain as to make estimates of ordinary incomes subject to a wide margin of error, but on the expenditure side, also, uncertainty is present to an unusual degree. The Government is apparently making strenuous efforts to reduce expenditure, but how material will be the results upon the financial problem cannot at this time be definitely foretold.* Finally, the important contingent liabilities which may soon become actual and pressing financial demands upon the Provincial Treasury are uncertain in amount. In view of these circumstances it will be readily understood why there was reluctance to furnish a definite statement of the amount which must be raised by taxation.

It is very important that this amount be made definite at as early a date as possible not only because the tax programme can then be more exactly formulated, but also because the uncertainty is doubtless responsible for much of the present dissatisfaction with the tax system. Rates have been increased to the point where tax-paying is a very appreciable burden, and in some cases the yields apparently promise to be substantially greater than the estimates.† This naturally gives rise to a feeling on the part of the taxpayers that they are being taxed in a sweeping and unjust fashion without reference to needs for revenue.‡ Until it is possible to speak with some degree of certainty regarding financial necessities, this element of dissatisfaction cannot be eliminated. When it is possible to lay down a definite financial programme, the Government can demand, and will doubtless receive, more willing assistance from the taxpayers in carrying it out.

The Shrinkage in Revenues.

That the present financial stress is not a sudden development, but is the result of the operation of policies which have been in force during a series of years, is made plain by an examination of the financial records. In Table I. the attempt is made to classify the receipts for recent years in accordance with their general character as taxes, fees, subsidies, etc.§

---

* How far it is politically possible to carry a policy of retrenchment in British Columbia is an unanswered question.

† E.g., in the cases of the amusement-tax and the income-tax.

‡ This attitude of mind was evident from the testimony of a number of witnesses at the hearings—e.g., D. G. Marshall, K.C., *cf.* Record of Public Sessions of Taxation Board, page 5.

§ For a discussion of the desirability of classification and of the principles upon which the classification in Table I. is based, *cf.* Appendix A, *infra*, page 127. It has not been the custom to classify the receipts in the Public Accounts. Moreover, many of the items are entered under obscure titles. As a result it is impossible without somewhat elaborate analysis to gain a clear conception of the significance of the figures. The figures represent cash receipts. The data for the year 1916-17 are from manuscript, but for the earlier years are from the "Comparative Statement of the Receipts and Expenditures" published in the Public Accounts.

Grand total net revenue	$2,920,461 71	$8,874,741 94	$10,492,892 27	$10,745,708 82	$12,510,215 08	$10,479,258 74	$7,974,496 46	$6,291,693 60	$6,906,783 63

A glance at the totals, as illustrated by Graph I., reveals at once an alarming shrinkage in the revenues of the Province. The total net revenue for the past fiscal year (ending March 31st, 1917) is shown to be materially less than it was seven years ago (1909-10, $6,906,783.63 as compared with $8,874,741.94), and scarcely more than one-half as great as four years ago (1912-13, $12,510,215.08). In this situation alone there would seem to be sufficient occasion for concern without considering the added difficulties due to increased demands upon the Treasury.

To show the variations in the different classes of revenues, Graph II. is presented, the length of the bars indicating the amounts received in the years indicated from each group of sources. Subsidies, it will be noted, have for six years been practically a constant amount. The income from the public domain, which averaged about $5,000,000 annually from 1910 to 1914, has dropped in the last three years to an average of only half that figure. Fees now yield only about $1,000,000, whereas they formerly brought in $750,000 additional. Taxes also have shrunk to nearly one-half their former productiveness, while there has been a substantial decrease in the miscellaneous revenues as well. The loss of revenue is evidently not due to some cause affecting merely one group of revenues. Every group has been adversely affected.

This same point as well as another one of interest is brought out clearly in Graph III., which compares the burden borne by the various groups of revenues in the years 1905, 1913, and 1917. In 1905, which is selected as a typical year before the great expansion of the last

decade, less dependence was placed upon the receipts from the public domain than was the case in 1913, the year of the largest receipts, and 1917, the most recent year. Taxes and fees were relatively more important in the scheme of finance. Practically no change, however, is apparent in the proportions between 1913 and 1917, except an increase in importance of subsidies in 1917, which, as has been seen, was due not to the fact that they increased, but to the fact that they remained constant, while the yields from other sources declined. The percentages are shown in Table II.

* Includes interest on investment of sinking fund.

The portion of the financial burden of the Province borne by subsidies emphasizes in very striking fashion the great differences between the financial problem of British Columbia and those of the other Western Canadian Provinces. For where, as in this Province, the receipts from subsidies are sufficient to carry, on the basis of the 1917 figures, only 10½ per cent. of the burden, in Alberta they carried, in 1916, 28 per cent.;* In Saskatchewan, in 1916, 41 per cent.; and in Manitoba, 1915, 42 per cent.*

Although it has been shown that the slump in revenue is not confined to any one of the groups of receipts but is common to all, except subsidies, it can be plainly demonstrated that there is an identical cause for the slump in at least two of the groups,—fees and receipts from the public domain. That cause is the cessation in the demand for real estate. The first part of the proof of this assertion is supplied in Graph IV. It will be seen that the diminution of receipts from land sales almost to the vanishing point accounts for practically all of the reduction in the receipts from the public domain. Graph V deals with fees. It shows that in the most prosperous years "land revenue" and "registry fees,"† which owe their productiveness to the activity of the real estate market, made up the bulk of the total receipts from fees and that the decrease in these receipts is almost entirely due to the falling of these two types of fee.

* This disregards the receipts from the Telephone Department.

† The land revenue and registry fees are combined in the following table:—

Receipts from Land Revenue and Registry Fees, Province of British Columbia, 1910-17.

Year.	Land Revenue.	Registry Fees.	Total.
1909-10	$175,778 11	$108,826 15	$ 584,604 26
1910-11	321,586 98	613,092 22	934,679 20
1911-12	323,895 21	592,398 73	916,293 94
1912-13	301,184 95	712,258 43	1,013,443 38
1913-14	218,525 92	652,431 48	870,957 40
1914-15	127,469 53	443,727 67	571,197 20
1915-16	81,117 53	241,548 50	322,666 03
1916-17	79,919 19	196,663 90	276,583 09

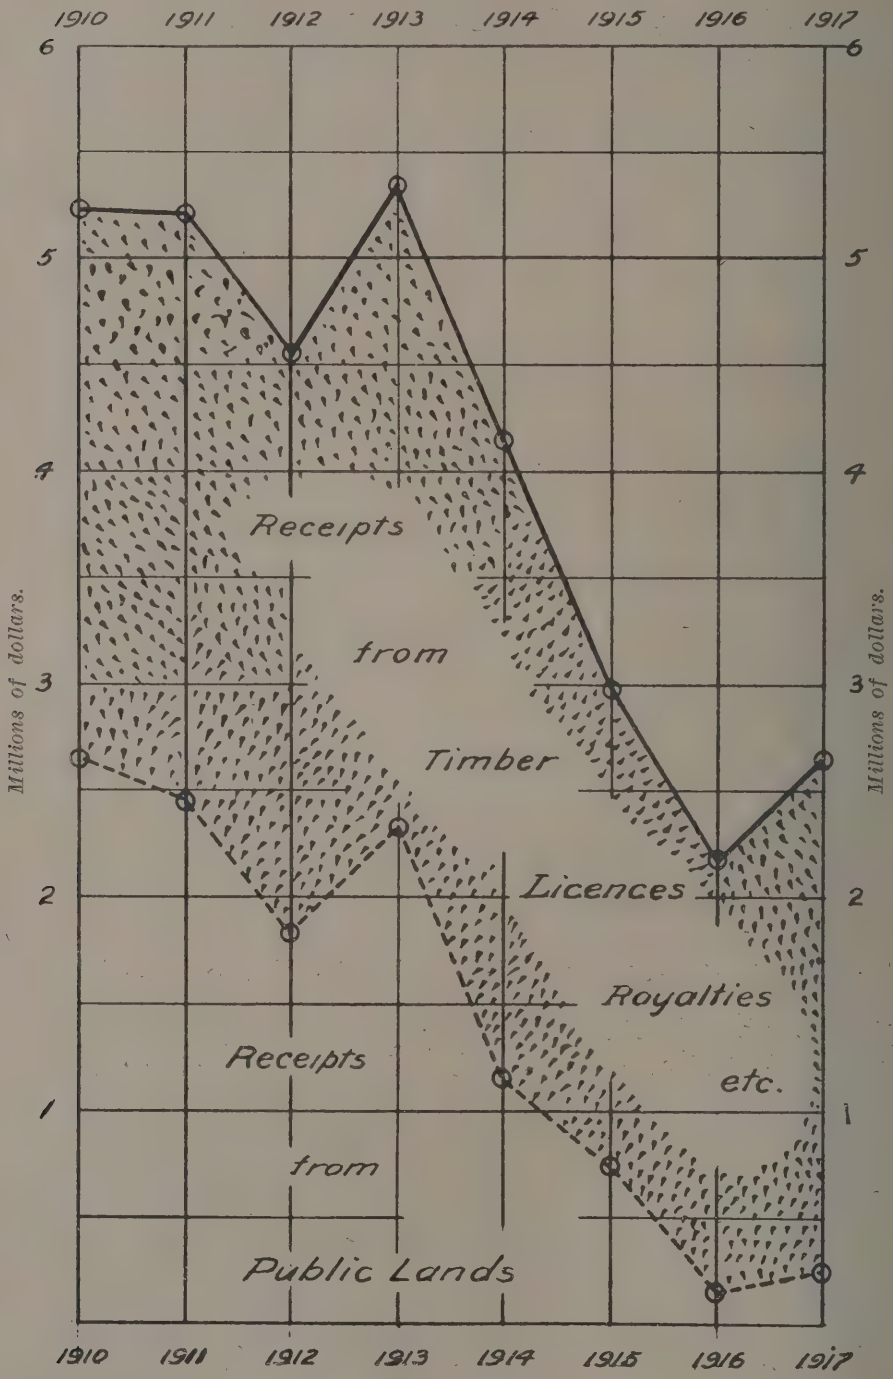
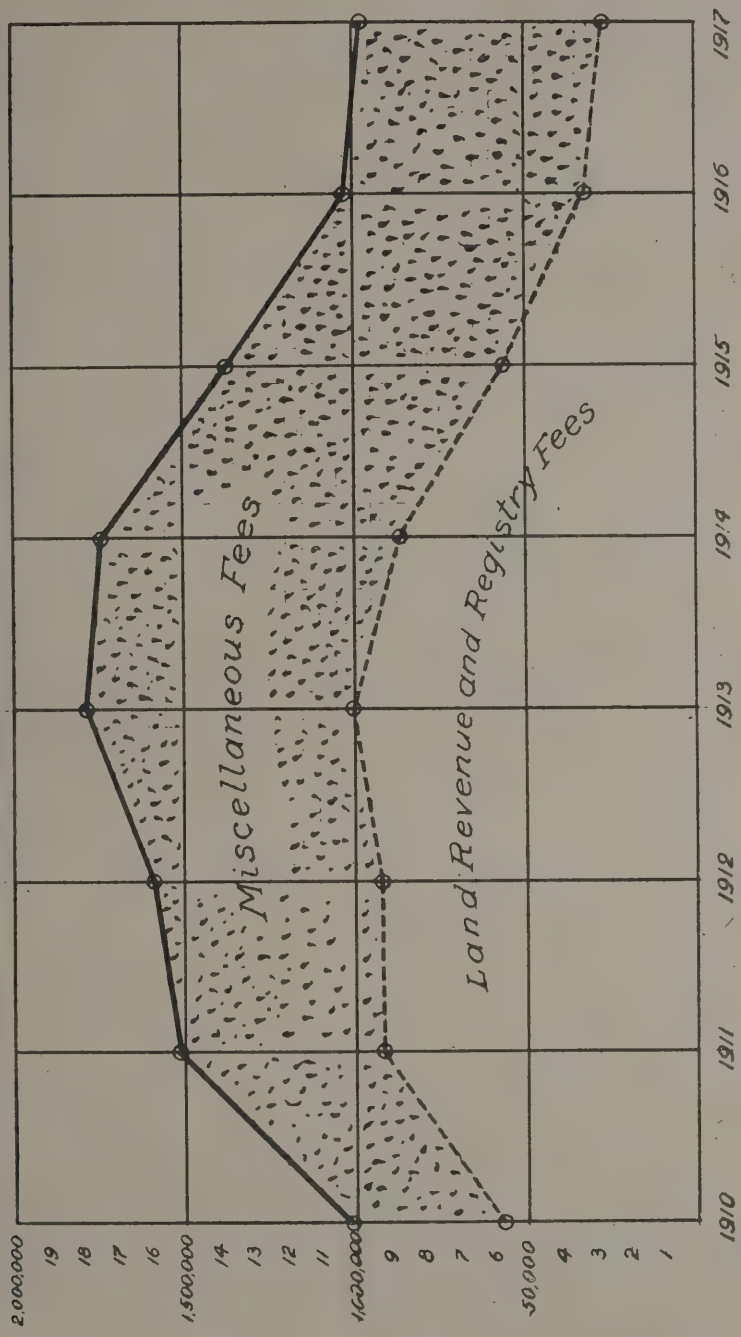




Graph V.—Receipts from Fees, Province of British Columbia, 1910-17.

In the case of taxes the explanation of the slump is quite different, as is shown by Graph VI. Here the decrease in productivity is entirely due to the abandonment of two forms of taxation—the tax imposed under the "Chinese Restriction Act" and the revenue or poll tax. These taxes yielded more than half the tax revenue in 1913, but disappeared entirely after 1915.

It is seen, then, that the explanation of the drop in revenue of about $5,500,000 in four years is roughly this: Due to the cessation of the activity in real estate the receipts from land-sales dropped nearly $2,500,000, and the receipts from fees connected with land transfers dropped $750,000. The bulk of the decrease is therefore chargeable to those forces which have demoralized the demand for real estate in British Columbia during the past few years. Almost all of the remainder of the decrease, about $2,000,000, was due to the disappearance of the Chinese tax and the poll-tax.

The shortage of revenue is accordingly not chargeable to a break-down of the tax system. Whatever may be said of the success or failure of the administration judged by absolute standards, it cannot be asserted that present difficulties are caused by a deterioration in that administration. Whether the taxes have produced as much as they should is a question still to be considered. It is not because they produced less than usual that the present difficult situation has developed.

The causes of the cessation in the demand for Provincial lands and for real estate generally are not entirely clear. Certainly one of them was the outbreak of the war, but the exact importance of this cause would be difficult to determine. To the extent that the war has had the effect of deadening real-estate activity, the financial problem of the Province can be truly said to be a war problem.

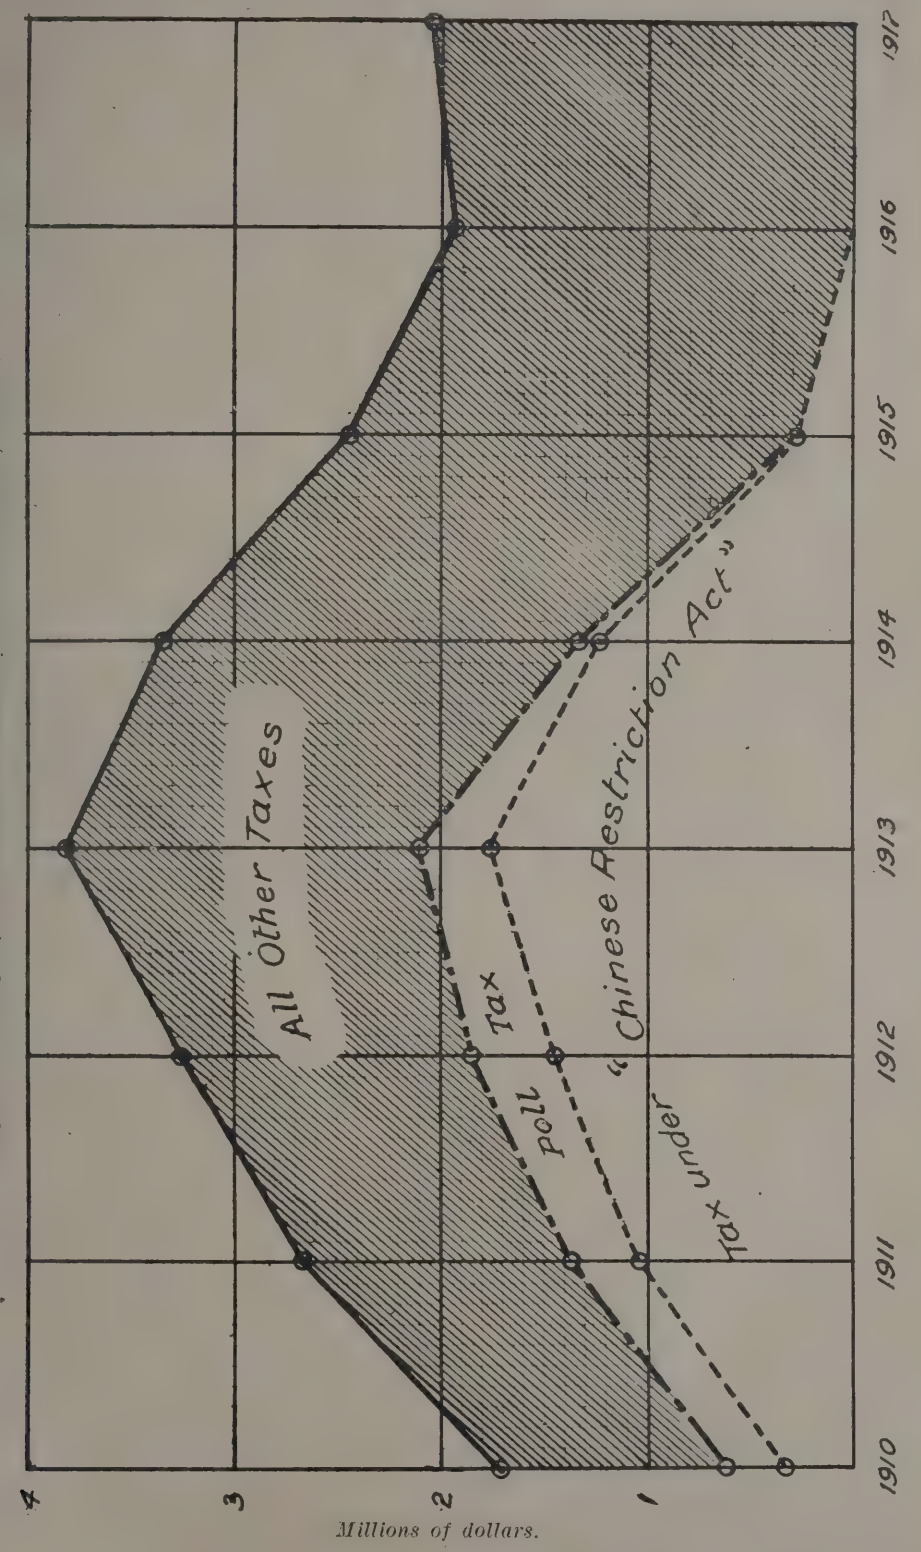
The experience of the past four years has demonstrated the lack of stability of the revenues of the Province. They have shown themselves to be excessively variable and undependable, and this constitutes the explanation of a very large part of the present difficulty. The situation in general is one which imperatively demands the adoption of one of two policies. Either the revenue system must be accepted for what it is and the policy of expenditure framed in such a fashion as to accommodate itself to the variations in receipts, or the revenue system must be radically recast with the purpose of making it productive of a more uniform series of revenues. The latter plan would be very difficult to establish completely, because of the dominating importance of receipts from land-sales in the scheme of revenues. But the desirability of a more uniform yield should be kept prominently in mind in considering changes in the tax laws. The most satisfactory solution of the difficulty lies in the direction of a more intelligent control of expenditure than has been shown in the past.

THE CONTROL OF EXPENDITURES.

This is not the place to write a financial history of the Province, though such a study would undoubtedly yield conclusions which would be valuable in connection with the proper formulation of future financial policies. It is evident, however, from a cursory survey that the scale of expenditure of the Province has been entirely out of proportion to the size and dependability of the revenues. In the years when revenues were plentiful the spending proceeded with a blissful confidence that conditions would always be satisfactory. Equipment and governmental services have been supplied with a lavishness which has entirely consumed the very unusual revenues of the prosperous years, and which has, in addition, strained to the limit the credit of the Province. Not only was money borrowed in large amounts, the net debt at the time of the 1917 Budget speech being reported as $19,777,909, but, in addition, the public credit was pledged to guarantee bonds of several railways in even larger amounts, the Province being subject to a contingent liability, in the case of the Canadian Northern alone, of no less than $47,975,000.* The transportation projects have all proved to be unsuccessful ventures from the financial view-point. As a result the Province has already been called upon to assume obligations of embarrassing size, and, unless the Canadian Northern problem is satisfactorily adjusted, it will be asked to carry a burden which will indeed be staggering.

The Estimates for 1917-18 called for an expenditure of $10,800,804.67. Of this amount, almost one-fifth ($1,985,520.67) consisted of charges connected with the public debt and about

* The securities actually executed which the Province has guaranteed for it amount to about $8,000,000 less than this figure. The total guarantees for all purposes authorized amounted on March 31st, 1916, to $73,782,072 (Public Accounts, 1916, page 27).



Graph VI.—Receipts from Taxation, Province of British Columbia, 1910-17.

one-tenth ($930,200) of expenditures connected with the guarantee of railway bonds. It will be recalled that the net revenue for 1916-17 amounted to less than seven millions ($6,906,783.63). With the loan market so unfavourable as to make borrowings almost out of the question, it will be realized that if additional taxation were to be avoided the controllable expenditures would have to be cut almost in two.

After a certain point, however, reductions in expenditure in a Province like British Columbia are difficult. Much rough and thinly settled territory lies within its borders where no local governments have been established, and in such districts the Province must provide machinery for performing all the functions of government. The expenses of this nature are often almost as great for a very sparsely settled region as they would be were the district well inhabited. Communication must be established and maintained between widely scattered settlements over difficult terrain. The policy of granting very liberal subsidies to local schools even within regularly organized municipalities has long been in operation, and radical reductions in this direction are not easy to accomplish or desirable as a matter of policy. Most of the readily effected economies had already been taken advantage of in the course of reducing net expenditure from $15,762,912.48 in 1913-14 to $9,079,317.70 in 1916-17.

Apparently the days of free and easy financing are past and may not be expected to reappear for some time to come. Unless some unforeseen event should suddenly restore the demand for real estate, the people of British Columbia must face painful economy and burdensome taxation. In any case the desirability of the strictest economy is beyond question. The more the people are willing to economize the less painful need the taxation be.

THE READJUSTMENT OF 1917.

Faced with the necessity of providing for the rather alarming discrepancy between estimated expenditures and the revenues which might be expected to accrue for the year ending March 31st, 1918, the Government at the 1917 session of the Legislature formulated a financial programme calling for a radical expansion in taxation. As will be seen by examining Table III., the changes made were expected to increase the receipts from taxes from approximately $2,000,000 to nearly $5,000,000.

Table III.—A Comparison of the 1916-17 Receipts from Taxation and the 1917-18 Estimates.

Taxation.	1916-17 Receipts.	1917-18 Estimates.
Succession duty	$277,702 73	$400,000 00
Poll-tax (revenue-tax)	.....	150,000 00
Taxes on real estate—		
Improved real estate	532,106 85	1,330,000 00
Wild lands, Coal lands, Class A, Coal lands, Class B, Timber lands	521,325 26	915,000 00
Personal-property tax	291,412 83	700,000 00
Income-tax	296,801 75	1,090,000 00
Tax on railways	.....	.....
Unworked Crown-granted mineral claims	37,903 97	50,000 00
"Chinese Restriction Act"	.....	.....
"Motor-traffic Regulation Act"	134,361 50	120,000 00
Amusement-tax	.....	100,000 00
Totals	$2,091,614 89	$4,855,000 00

This was to be accomplished, in the main, through the reintroduction of the poll-tax, the establishment of an amusement-tax, by sharp increases in the rates on property and income, by making subject to the tax certain incomes before exempt, and by an attempt to collect outstanding arrears. Because the 1917 tax rolls were already completed, the increases were made to apply as surtaxes, in addition to the normal rates, for 1917. For the following years the rates were raised to a level equal, in almost all cases,* to the sum of the 1917 normal and surtax rates.

* An exception is the case of the highest income-tax rates.

The changes made in the tax system have provoked much criticism and dissatisfaction. It must be remembered, however, that under the conditions time was not available to the Government to work out a carefully balanced tax programme which would consider with a high degree of nicety both the financial needs of the Province and the tax-paying ability of the various economic interests affected. Such a programme can be constructed only after thorough investigation.

As has been noted, the dimensions of the financial demands of the coming year are uncertain. The results of the 1917 changes in the tax system have not yet become fully apparent. There is apparently but slight ground for the hope of a decrease in the Budget, for any economies which may be effected are likely to be overbalanced by new demands. On July 1st, 1918, a direct liability amounting to $647,072 will accrue because of the guaranteed bonds of the Nakusp & Slocan Railway which must be financed in some fashion. Temporary financing by the banks has been resorted to freely, and it may be necessary to make more formal provision for the $3,550,000 which now stands in this form ($2,000,000 overdraft and $1,550,000 Treasury bills).

Perhaps enough has been said concerning the financial situation in British Columbia at the present time to show why it is difficult to forecast accurately the probable demands upon the tax system. Certainly the situation, viewed optimistically, is not a reassuring one, while, if the Province is not relieved of the menace of the Canadian Northern guarantee, and the tax system, after having been called upon to furnish $5,000,000 in place of $2,000,000, is then required to furnish $10,000,000 or $11,000,000 in place of the present $5,000,000, the situation will be a very desperate one.

A CRITICAL SURVEY OF EXISTING TAXES.

INTRODUCTORY.

The division of taxing power between the central and the local governments in British Columbia is somewhat unusual and peculiar. The situation is unlike that in the Prairie Provinces of Canada, where the cities and towns are, as a rule, given the exclusive right to tax directly all real and personal property, and the Provincial Treasury is supported almost entirely by indirect taxes, subsidies, etc. It is also unlike the arrangement in most of the States of the Union, where the State Treasuries are supplied largely by rates levied upon the same assessment base as is utilized by the municipalities. In British Columbia the distribution is much more complicated and involved. Direct taxation, far from being abandoned entirely to the localities, is made a prominent factor in Provincial finance.* But in part of the Province the Provincial authorities tax directly certain property—i.e., real estate—which in other sections it consigns it to the municipalities for taxation. On certain other types of property—i.e., personal property and income—the Provincial authorities levy taxes throughout the Province irrespective of municipal lines. This complication is due primarily to the fact that a large portion of the Province is too thinly settled to justify the establishment of local government, and in such territory the Province taxes real estate and business, whereas it has surrendered these sources of revenue entirely where local governments have been organized. The municipalities, urban and rural, supply themselves mainly by taxes on these subjects, but, in addition, are assisted by liberal subsidies from the Provincial Treasury.

These facts are not apparent in the accounts of the Province. Receipts from taxes on real estate do not appear as arising from the unorganized territory only, and receipts from taxes on personal property and income, on the other hand, are not shown as the revenue from a Province-wide tax. All of these receipts go into a general fund, and no attempt is made to meet particular expenses—those of unorganized districts, for example—out of the receipts from particular taxes.

The main structure of the Provincial tax system is set forth in "An Act to assess, levy, and collect Taxes on Property and Income."† This Act provides for the imposition of general taxes at specified rates on real estate (lying outside of municipalities, as explained above), on personal property, and on incomes. But it also provides that "the following property shall be assessed and taxed *specifically* pursuant to the several parts of this Act governing the subject:—‡

(*a.*) Canneries:

(*b.*) Coal and coke:

(*c.*) Certain corporations:

* *Cf.* supra, p. 87.
† R.S.B.C. 1911, as amended from time to time.
‡ "Taxation Act," section 7.

(*d.*) Mines and minerals other than coal and coke:
(*e.*) Mining property held by Crown grant and not worked:
(*f.*) Railways and railway subsidy lands.

These *specific* taxes operate in some cases to relieve the property from the general taxes. In other cases they do not.* The charges imposed on canneries, coal, and minerals are based on output, and partake more nearly of the nature of royalties than taxes, and are so grouped in the classification given above.† The special charges on timber (licences, royalties, etc.) are provided for by separate legislation. Finally, there are Provincial taxes on inheritances, on amusements, on motor-vehicles, and on polls.

In addition to the taxes imposed for the benefit of the Provincial Treasury, there are local school taxes administered by the Province whose proceeds go to the localities in the extra-municipal territory.

The form in which the Public Accounts are presented makes it difficult to present a detailed statement of the yield of the various taxes, but in Table IV. the available data for 1917 are arranged so as to present as clearly as possible the relative importance of the various taxes as indicated by the returns for that year. It will be noted that in the cases of three of the "specific taxes" (the tax on canneries, on certain corporations, and on railroads) the receipts are not separately stated, but are merged with the receipts from the "general" taxes. Defined thus, general taxes yield roughly one-third of the tax revenue. Another third is supplied by the charges on timber alone (licences and royalties). The miscellaneous specific taxes (excluding all of the royalties) yield less than $500,000.

GENERAL TAXES.

The receipts from general taxes‖ for a period of years are given in Table V., which forms the basis for Graph VII. There has been a moderate shrinkage from 1915 to 1917 amounting to slightly more than $200,000, the decrease being divided almost equally between real property and income. The increase in personal property must be interpreted in the light of the alternative

* *Cf. infra,* pages 109-10.
† *Cf. supra,* page 82.
‡ Included among the receipts from general taxes are the receipts from the following specific taxes: Tax on canneries (included under personal property), tax on railways (included under improved real estate), and taxes on certain corporations (included presumably under income).
§ The gross levy on canneries and whaleries was $40,762.64.
‖ The figures include, as explained above, the taxes on canneries, railroads, and certain corporations.

TAXES ON REAL ESTATE.

The taxes on real estate are of four distinct types, as follows:—

(1.) Taxes on improved real estate;
(2.) Taxes on wild lands;
(3.) Taxes on coal lands; and
(4.) Taxes on timber lands.

In the accounts the receipts from the last three of these taxes are not differentiated. In Table XX. the yield of the wild, coal, and timber land taxes are contrasted with the yield of the tax on improved real estate for a period of years. It will be seen that before 1912 the tax on improved real estate regularly yielded larger sums annually than the taxes on wild, coal, and timber lands. For a five-year period beginning 1912 the situation was reversed, the receipts from improved real estate falling below the receipts from the other real-estate taxes. Finally, in 1917, improved real estate once more proved more productive than the other taxes.

The details which are lacking in the accounts of actual receipts can be made good to some extent by the more complete statistics of tax levies. The levies, however, do not form so accurate a basis for drawing conclusions as to the relative financial importance of the various types of taxes as do the cash receipts, because of the very large and widely varying amounts of uncollected taxes.† Table VI. gives the levies for 1916 in detail. The tax burden on wild lands is seen to have been about 50 per cent. larger in that year than the burden on improved land, in spite of the fact that the actual collections, as shown for approximately the same period in Table VII., were somewhat smaller. The taxes on timber and coal lands are relatively significant in amount.

Improved Real Estate.—The tax on improved real estate, appearing as the "real-property" tax in the Statute and in the accounts, consists of a 1-per-cent. rate imposed upon the full value of improved lands and permanent improvements* lying outside the limits of municipalities. The rate previous to 1917 was ½ of 1 per cent. The fullness of the assessment and the success of the collection of this tax are dealt with later in this report.†

The recent increase in the rates has caused much dissatisfaction, as is shown by the tone of the testimony offered before the Board. As a matter of fact, however, the rate of 1 per cent. is not inordinately high as compared with rates elsewhere where similar services are rendered. Indeed, when the practical immunity of the owner of improved land from personal-property taxes is taken into account, the lot of the British Columbia farmer cannot truly be said to be a hard one from the point of view of taxation. It is probably significant that some of the testimony clearly showed that it was not the absolute weight of the present burden which the farmers objected to so much as the inferred disposition on the part of the Government to consider improved real estate a likely subject for still heavier taxation.‡

The suggestions that farm lands be taxed on a basis which recognizes net yield as the controlling factor, and which discriminates even more than at present in favour of the operated farm equipped with reasonable improvements, are interesting and important. Any step in this direction should be preceded, however, by careful investigation which would attempt to reveal what could be rationally expected from the change in the directions both of encouragement to agriculture and of effects upon the finances of the Province. The present arrangement in regard to the taxation of real estate appeals to the investigator as not being so seriously unjust and oppressive as to demand hasty alterations at once without an opportunity for preliminary study and analysis.

Wild Lands.—It is a policy of long standing in British Columbia to levy a discriminating, penalizing tax on "wild" lands as opposed to improved lands. The primary purpose of the tax is to discourage the speculator from holding lands out of use. At the present time, as has been noted,§ this tax is as important fiscally as the tax on improved real estate. The rates since the changes in 1917 have been 5 per cent., an increase of 1 per cent. as compared with the previous level. This means taxation five times as heavy upon "wild" land as upon improved real estate.

It has been suggested that the classification which is made to determine what land is "wild" is undesirably crude. The law provides the Assessor shall consider "wild" "all land, other than coal and timber land, . . . on which there shall not be existing improvements to the value . . . of $2.50 per acre in the case of land lying west of the Cascade Mountains, and $1.25 per acre in the case of land lying east."‖ Much land is subjected to the 5-per-cent. rate which should not or cannot be put to use under present conditions. Moreover, the requirements of a modicum of expenditure for improvement sometimes leads to injudicious investment of capital, not with the primary purpose of developing the land, but with the intent merely to qualify under the

* The policy of exempting improvements, wholly or in part, is restricted in its application to the municipalities.
† *Cf. infra*, pages 118-19.
‡ *Cf.* Testimony, page 180.
§ *Cf. supra*, page 96.
‖ "Taxation Act," section 2.

Act as "improved" land. It is recommended that careful consideration be given to the probable effects of refining the classification* by drawing a distinction between "wild" lands which are timber, arable, or agricultural in their nature and of determining the application of the penalty rates on the basis of actual use or disuse and the social desirability of such disuse.

This suggestion assumes the desirability of continuing a distinction between wild and improved lands. There is present a considerable sentiment, on the part of the owners of wild land in particular, in favour of abandoning or materially modifying the discrimination. The question, of course, must not be settled on the basis of the desires of this group alone. But there exist reasons for modification which appear valid from the point of view of the general interests of the Province. Indeed, the tax exhibits unmistakable symptoms of something being seriously amiss. Only about one-third of the current year's levy was collected in 1916, and the total accumulated arrears now amount to more than twice the current year's levy.† This record is very poor compared with that made by the owners of improved realty. To increase taxes on wild land still further in the face of this record, as was done in 1917, involved a confidence in the willingness of the owners of wild land to continue to pay which can scarcely be justified on the basis of the facts. The very existence of a tax of this type implies the presence of other motives than the fiscal motive, however. The Province practically announces that land may not be held out of use without payment of a heavy charge, and that if a person cannot afford to pay that charge he must surrender his land. But the charge can be made so high that it will not be economically wise for the individual to continue to pay the taxes which he must pay if his title is to be kept clear. Evidently that is what has occurred in many cases in British Columbia already. The present rates are apparently resulting in wholesale confiscation. But, if any significance is to be attached to the settlement permitted under the "Soldiers' Homestead Act" this confiscation is not desired by the people of the Province.

It is perhaps clear that there is some degree of antagonism between the two aims of this tax—viz., the fiscal aim and the social aim. To be a good revenue-producer, rates should be moderate. To be a good engine of social reform, the rates should be high. The problem is to strike the particular compromise which will best meet the desires of the Province. In this case one cannot eat his cake and have it too.

Coal Lands.—Coal lands are placed in a separate category for purposes of taxation. They are defined as all lands "owned, leased,‡ held under licence,‡ claimed, or occupied by any person for the special purpose of mining coal therefrom, and which is not held or used for any other purpose."§ These lands are subdivided into two classes. Lands in Class A, which include the lands which are being actively mined, pay the same tax rate as improved agricultural real estate, 1 per cent.‖ Class B lands, consisting of unworked coal lands, are taxed at a 4-per-cent. rate (until 1917, 2 per cent.).

The distinction between the active and inactive coal lands rests on the same theoretical foundation as the distinction between improved and wild land. It is, of course, directly contrary to the fundamental theory of the income-tax. In any reformulation of policy which is attempted with respect to wild lands, coal lands should be included in the consideration.

The tax on coal land is not of great fiscal importance, the total levies for years past, as set forth in Table VIII., having been in the neighbourhood of $50,000 annually. The increase in the rate on Class B land in 1917 causes a substantial increase in the levy. But, if the absence of formal complaint before the Taxation Board be of any significance, the higher rate has not caused great dissatisfaction. Certainly the burden added to the coal-mining interests is in no sense comparable to that added to metalliferous-mining interests by the legislation of 1917.

* This is in accordance with the suggestion of the Hon. John Oliver.
† *Cf. infra*, pages 121-2.
‡ The exemption stated in section 8, subsection (24), of the "Taxation Act" evidently applies here.
§ "Taxation Act," section 2.
‖ The distinction between Class A and Class B coal lands is set forth in section 9 of the "Taxation Act." Briefly, the test as to whether the land shall be considered active is the payment of the royalty on coal mined. Contiguous lands may be classified as Class A to the extent that the royalties paid will cover the tract at the rate of 25 cents for each acre.

Table VIII.—Levies on Coal Lands, 1909-17.

Year.	Class A (Active).	Class B (Inactive).	Total.
1909	$15,234 57	$ 5,459 85	$20,694 42
1910	17,367 36	5,004 11	22,371 47
1911	19,787 88	22,920 61	42,708 49
1912	20,651 85	23,651 29	44,303 14
1913	16,443 14	34,058 96	50,502 10
1914	22,696 47	33,444 13	56,140 60
1915	21,930 46	37,264 80	59,195 26
1916	20,093 27	36,400 24	56,493 51
1917	21,038 53	74,432 00	95,470 53

Timber Lands.—The policy of the Government in regard to the timber lands has varied radically from time to time. Formerly it was the practice to dispose of large tracts of forest by Crown grant, and later under leases and licences. A tax is levied on all such land* "which in the opinion of the Minister of Lands is held in sufficient areas for the purposes of forestry," provided it contains marketable timber to the average extent of 8,000 feet to the acre west of the Cascades and 5,000 feet east of that range.† Until 1917 the rates on timber land were 2 per cent. of the assessed value. They were raised in that year to 3 per cent.‡

The rate of 3 per cent. is difficult to justify on any other than the punitive, penalizing theory of the wild land and Class B coal land taxes. Heavy taxation on the capital value of timber lands is universally condemned by students of forest taxation as an undesirable type of levy. It is asserted also by the timber interests that the change has brought about a condition of substantial inequality because it involves increased taxation upon one section only of the timber industry—viz., those concerns who chance to be operating over lands procured when the earlier Provincial policies were in force.

The levies upon timber lands for a period of years are shown in Table IX. While materially larger than the levies on coal land, the tax is one of the distinctly minor sources of revenue.

Table IX.—Levies upon Timber Lands, 1909-17.

1909	$104,671 63
1910	110,789 62
1911	137,820 33
1912	150,059 19
1913	166,580 61
1914	186,671 13
1915	167,651 95
1916	179,528 55
1917	264,687 87

It is seen that the most immediate and troublesome questions connected with the taxation of real estate are concerned with the taxation of wild, coal, and timber lands. The principle of penalizing non-use appears to have been carried to the point where it seriously affects the fiscal productivity of the tax. In the light of present financial pressure the policy of the Province in connection with these taxes is worthy of serious attention. The effect of the added taxation on timber lands deserves a detailed examination which requires more time than was available in the course of this investigation.

TAXES ON PERSONAL PROPERTY.

Unlike the taxes on real estate, the personal-property tax is Province-wide in its scope, being applied both within and without municipal boundaries. While formerly it was a part of what was essentially a general property-tax system, various changes have in the course of years consigned it to a decidedly anomalous position in the tax system. First of all, exemptions have been granted with such liberality as to reduce the tax on personal property from a general tax

* The exemption stated in section 8, subsection (24), of the "Taxation Act" evidently applies here.
† "Taxation Act," section 2.
‡ *Ibid.*, section 9.

to what is in practice mainly a tax on stock-in-trade. Thus machinery is defined in the law as real estate,* and is therefore only taxable by the Province outside of the municipalities. If it were defined as personal property it would be subject to the Provincial tax within the municipalities also. Other important exemptions include money invested in mortgages on property in the Province, the securities of companies paying Provincial taxes and of municipalities, unsecured book debts, bank deposits, household furniture, farm produce, and, to the amount of $1,000, the live-stock, machinery, and vehicles on every farm.†

Formerly the income-tax was imposed in addition to the personal-property tax. But the drift away from the taxation of personal property which has been evident in British Columbia for so many years early took the form of an attempt to substitute the income-tax for the personal-property tax. The ideal and the theory of the income-tax apparently makes a strong appeal to the business-men of the Province, and, suffering by constant comparison with the income-tax, the personal-property tax has become increasingly unpopular. The Assessment Commission of 1905‡ recommended the substitution of the income-tax "for any impost on personal property." The Royal Commission on Taxation of 1911§ repeated this recommendation. It is now urged once more by the Vancouver Board of Trade.

The movement in this direction has been strengthened by the action of the Province in establishing the alternative arrangement under which a person assessable on both personalty and income pays that tax only which is largest in amount. This practically consigns the personal-property tax to the rôle of a minimum income-tax.

The excuses for the failure to abolish the personal-property tax and the persistence of the present alternative arrangement are lack of confidence in the administration of the income-tax and a desire to ensure a certain minimum of revenue. To abolish the personal-property tax would, of course, increase somewhat the variability of revenues. There is, however, some ground for the complaints of business-men that the arrangement as it now stands operates unfairly. It is recommended that the income-tax be entirely substituted for the personal-property tax, provided the administration of the income-tax is improved and the condition of the Provincial Treasury is such as to enable it to assume the risk of the somewhat decreased revenue which would probably result.‖ If the abolition of the personal-property tax alternative involves increasing income-tax rates still more, the step should not be taken at this time.

The rate which formerly obtained, ½ of 1 per cent., was so low as to impose but a relatively slight task upon the administration. Raising it to 1 per cent., as was done in 1917, increases the difficulty of securing a full assessment. But this rate is still low compared with those obtaining in the States of the Union, and with the liberal exemptions of the types of personal property most difficult to assess, the fiscal yield of the tax should not be seriously menaced by administrative difficulties.

THE INCOME-TAX.

The history of the development of taxation in the Province shows an interesting tendency toward the magnification of the income-tax. Yielding in 1905 the insignificant sum of $72,053.22, the tax has increased in fiscal importance until in 1917 it produced $296,801.75. Moreover, the readjustment in 1917 resulted in a substantial widening in application and a radical increase in the rates. If the history of income-taxes elsewhere repeats itself in this case, a progressively larger rôle is to be expected for this element in the revenue system. This, of course, adds importance to the proposal to refine the tax and to place it upon a satisfactory basis.

The income-tax in force in the Province of British Columbia is open to serious criticism from several directions. Taxable income as determined under the law bears only a remote resemblance to true net income. Because of irregularities in the progressive scale of rates and because of special provisions affecting particular groups of taxpayers, the tax is inequitable in its application. All available evidence shows the law to have been ineffectively administered even under the low rates in force in the past. The imposition of the new Federal income-tax, which

† "Taxation Act," section 8.
‡ Report of February 16th, 1905, cited by Vineberg, Provincial and Local Taxation in Canada, page 45.
§ Report, pages 19, 20.
‖ The personal-property tax in 1917 produced $291,412.83. The abolition of the personal-property tax alternative would not involve the sacrifice of this total amount, however, for a considerable portion of it would be supplied by the income-tax ruled out under the alternative arrangement.

draws upon the same source, and the increase of the Provincial rates create a situation which is full of sinister possibilities for the future of this tax. Inequalities which can be ignored when rates are low become important when rates are raised to the present levels. An administrative reorganization is imperative, a redefinition of taxable income is very desirable, and a reduction in rates may be found necessary if the tax is to be made workable and successful.

THE DEFINITION OF TAXABLE INCOME.

In form the British Columbia income-tax is a tax on net income, but the number of items, essentially expenses, which may not be deducted in arriving at "taxable income" is so great that the result cannot truly be described as "net." Most of the forbidden deductions appear to be placed in the law because of the fear that they will lead to wholesale evasion. Undoubtedly the complaints are well founded that the law in its present form leads to considerable injustice. Under proper administrative conditions it should not be necessary to sacrifice equality to secure a full assessment. But to bring about these conditions there must be a reorganization of the tax machinery and a change of attitude on the part of the taxpayer toward the law. To accomplish the latter it may be necessary to reduce somewhat the present scale of rates.

The items which the taxpayers insist they should be permitted to deduct, but which under the present law they must include in their return of taxable income, are the following:—

(*a.*) Allowances for depreciation and depletion:
(*b.*) Interest on borrowed capital, irrespective of the resident or non-resident ownership of such capital:
(*c.*) Directors' fees and salaries of certain officers and managers of the corporation:
(*d.*) Taxes paid to the Federal Government:
(*e.*) Local taxes on business buildings occupied by owners:
(*f.*) Losses and bad debts, even though not written off during the year when the liability is incurred.

Allowances of Deductions for Depreciation and Depletion.—The provisions of the present law make it impossible to deduct depreciation and depletion allowances from gross income in arriving at "taxable income."* This situation does violence to business customs and good accounting practice, and is the cause of much bitter resentment, particularly among the large taxpayers. Depreciation is a very important item in many industries, and, moreover, it varies greatly from business to business. Consequently not only does the taxpayer consider himself taxed on an item of prime cost as though it were a profit, but he also, quite properly, feels himself at a disadvantage as compared with his neighbour whose capital is of a nature which depreciates less rapidly than his own. It is the prevailing practice generally where income-taxes are levied to allow reasonable deductions for depreciation, and it is strongly recommended that the law be so amended as to permit such deductions in British Columbia. Allowances for depreciation should never be permitted to exceed the amounts charged for such purposes in the accounts of the enterprise. Repairs, narrowly defined, should be deductible in addition to depreciation, but renewals and replacements are properly covered by depreciation itself.

Obsolescence is one of the elements in depreciation, but practice varies in regard to allowing it as a deduction in determining income for purposes of taxation. The Wisconsin law expressly forbids such deductions.† The United States Federal law permits them,‡ and the language of the new Dominion law is evidently sufficiently broad to allow them at the discretion of the Minister of Finance.§ In case they are allowed, the deduction should be restricted to the obsolescence which actually accrues. Obsolescence cannot be anticipated with a degree of certainty necessary to make it a proper deduction before its actual occurrence.

As would be expected where mining forms so large a part of the economic activity of the Province, there is dissatisfaction because of the fact that no deductions are permitted on account of depletion. If the income-tax is to be a tax on true net income, such allowances should certainly be made. This coincides with the prevailing practice in American income-tax laws. Depletion is specifically provided for in the new Dominion law‖ and in the Wisconsin income-tax

* Subsection (12), section 75, of the "Taxation Act" declares that no deduction shall be allowed "for depreciation, or for any expenditure of a capital nature, or for renewals or extensions."

§ The "Income War Tax Act," section 3, subsection (1) (*a*).
‖ The "Income War Tax Act," *loc cit.*

law.* Formerly it was permitted only in part by the United States Federal law,† but recent changes make possible full deductions.

In allowing for depletion, the total deduction should never exceed the actual cost in cash of the ores and deposits. If this rule is applied, mistakes in the direction of too great or too small allowances for depletion tend to eliminate themselves. Thus, if depletion is claimed at too heavy a rate, the taxable income in later years would be increased, whereas if the rate of depletion is made too light it can be increased and the tax correspondingly lightened when this becomes apparent.

Only two points can be advanced in defence of the present practice of refusing deductions for depreciation and depletion. One is that the Province cannot afford to give up the revenue which it would lose if allowances for these purposes were permitted. The other is that it is impossible to construct a satisfactory plan for the determination of the amounts to be allowed as deductions for such purposes. In regard to the first point, it may be confidently asserted that it would be better, in the case of depreciation at least, for the Province to advance rates on the new base to a height sufficient to make up for the loss in revenues. The second point, considered in the following section, is more serious.

The Determination of the Amounts of Depreciation and Depletion.—If it be granted that deductions should be allowed for depreciation and depletion, the question arises immediately as to what machinery should be provided to administer this part of the tax law. A moment's consideration reveals the undesirability of fixing by Statute the rates of depreciation to be allowed in the various lines of business. A Statute which attempted to do this would be complex and crude to a ridiculous degree. The ordinary procedure elsewhere is to vest some administrative officer with authority to pass upon the question of the reasonableness of the claims for depreciation, sometimes with restrictions upon the size of the allowances and sometimes without. As a practical question in the Province of British Columbia, the delegation of such power to a single individual, or to a group of individuals who are in a position where political influence is a factor, would be highly undesirable. The duty of passing on such questions would carry with it a responsibility which would probably not be welcomed by the present or any future Minister of Finance. The proper exercise of this function is not a political matter. It consists of a process of arriving at a decision on the basis of ascertainable fact. It is possible, by a reasonable degree of industry on the part of officials and co-operation on the part of business-men, to arrive at results which are substantially accurate, and if the power were in the hands of a body in whose ability and disinterestedness the business-men of the Province had confidence, there is no question that the problem would be satisfactorily solved. The matter therefore resolves itself into that of establishing an administrative Board sufficiently high in calibre and sufficiently far removed from political influence to merit the confidence of the citizens of the Province.

What restrictions should be placed upon such a Board in the exercise of its function of passing upon deductions for depreciation is a question whose answer depends upon circumstances. Is it likely that pressure will be brought to bear to such an extent as to sweep the Board off its feet? Is there a fiscal necessity which, while it permits a moderate allowance for depreciation, precludes the possibility of full or liberal allowances? In general it is, of course, desirable to fetter the Board as little as possible, provided always that a Board of high quality is obtainable.

Another question to be decided is that of appeals from the decisions of such a Board. It may be wise to permit a dissatisfied taxpayer to present his case to the Supreme Court of the Province. But the inclusion of such a provision must not be expected to provide an automatic check which will prevent all abuses on the part of the Board. A taxpayer who has not been successful in securing the deductions he thinks proper may in this fashion have an opportunity to redress his grievances. But the taxpayer who, by one means or another, has secured deductions unfairly large in amount will not be prevented from profiting thereby because of the existence of this appeal to the Courts. The only way to meet this situation is by making sure that the Board is competent, independent, and upright. If such a Board cannot be secured, it were better to abandon plans for allowing deductions for depreciation, or even to abandon the income-tax in favour of some other method.

* The Wisconsin Income Tax Law, page 12.
† Montgomery, *op. cit.*, page 232 *et seq.*

Allowance of Deductions for Interest on Borrowed Money.—At the present time the law forbids the deduction of "any interest on borrowed capital from which an income is derived, if such interest is paid to a lender who is not a resident of the Province, or to a company as lenders, which company does not transact business in the Province, and which does not pay taxes thereon in the Province."*

Whether deductions should be permitted for interest paid on money borrowed from non-residents in this particular situation is a question concerning which much can be said on both sides. Fundamentally it involves the whole theory of *situs* in income taxation. It may be urged with some appearance of justice that the authority in whose jurisdiction the income is earned should have first claim upon it for purposes of taxation.† But British Columbia does not accept this particular theory of *situs* in a rigorously logical fashion, for no allowance is made for deductions in the case of citizens of British Columbia who have invested their capital abroad. From the point of view of the business, no distinction between resident and non-resident capital can be justified. As the business-man views the situation, he is permitted to borrow locally without penalty, but can borrow abroad only upon condition that he pay the Province (in some cases) 10 per cent. of the interest. This seems to him to be anything but taxation according to ability to pay. Moreover, when there is such a dearth of local capital it appears to be a direct discouragement to capital seeking investment within the Province.

However, there is a serious, practical question involved because of the manner in which many of the large undertakings in British Columbia are financed. For often the securities are so arranged that practically all of the money invested is represented by bonds, the true owners of the business appearing as creditors with their money loaned to the concern rather than as investors owning directly their equities. Under such conditions the deduction of interest charges in determining taxable income would convert the income-tax into an excess-profits tax. This would mean added variability in revenues and higher rates if the same yield was to be secured. A combination of a heavier property-tax with such an excess-profits tax offers interesting possibilities. At the present time, however, it is the opinion of the investigator that the allowance of deductions for interest on outside capital, important though it be, is not so urgent a matter as are some of the other changes, such, for example, as deductions for depreciation. If it can be afforded, it might be well to introduce it with a limitation upon the amount, somewhat after the fashion of the United States Federal income-tax law, which permits deductions for interest on indebtedness "to an amount of such indebtedness not in excess of"‡ the capital of the company and§ one-half of its interest-bearing indebtedness.‡ The Wisconsin law, which formerly restricted deductions for interest in a fashion very similar to the Federal law, has recently been changed so as to permit full deduction.§ Such limitations are open to serious criticism. There is no logical stopping-point between any allowance at all and complete deduction of interest. Moreover, limitations of this kind have an unfortunate tendency to encourage excessive capitalization. They can only be defended on practical grounds of fiscal necessity.

Allowance of Deductions for certain Fees and Salaries.—The law at present forbids deductions "for directors' fees, and for salaries of persons holding offices as directors, and for the salary paid the president, vice-president, and general manager of any company or body corporate."‖ The only excuse for such a provision is that, in its absence, the practice would prevail of distributing dividends through the device of inordinately high salaries and fees. A less crude method of preventing such practices is to vest some body with authority to pass upon the reasonableness of fees and salaries. The distinction suggested between resident and non-resident officers is one which is not easy to defend. If a permanent Tax Board is established, the control of these deductions should be made one of its functions.

Allowance of Deductions for Taxes paid to the Federal Government.—It was urged by witnesses who appeared before the Taxation Board that Federal taxes be deducted in arriving at income for the purposes of Provincial taxation. At present this is specifically forbidden.¶ This contention has a certain appearance of reasonableness, but upon close examination it proves to be a claim of very doubtful validity. The amount of net income has long been the standard

* "Taxation Act," section 76, subsection (10).
† Vineberg: Taxation in Canada, page 76.
‡ Montgomery, *op cit.*, p. 138.
§ The Wisconsin Income Tax Law (Second Edition), page 13.—Interest formerly could be deducted on indebtedness "to an amount of such indebtedness not exceeding its paid-up capital stock outstanding at the close of the year; provided that the amount of such capital stock shall in no case exceed the clear value of its assets over and above all indebtedness and liabilities.
‖ "Taxation Act," section 76, subsection (13).
¶ "Taxation Act," section 75, subsection (6).

used for determining what the contribution of the taxpayer shall be toward Provincial expenses. Recently the Federal Government has adopted this standard also for determining the amount of certain taxes levied for Dominion purposes. These taxes in some cases are very large, and to permit their deduction would substantially reduce Provincial taxes. In other words, the imposition of the Federal tax, if deduction were allowed, would automatically diminish the Provincial tax burden in every case where a Federal tax is payable. From the taxpayer's point of view he is certainly less able to pay taxes to the Province in the presence of these Federal taxes. But, on the other hand, it may be contended for the Province that the Federal burden was placed upon these taxpayers with full knowledge of the existence of the present Provincial burden and in the confidence that there exists an additional ability to pay taxes which justifies the new levy, distributed as it is. The fundamental question, of course, is whether the Provincial tax burden is apportioned more fairly among the taxpayers when Federal taxes are deducted from income than when they are included. The writer is inclined to believe that the most wise and just course in this case is to consider the Federal and Provincial income-taxes as merely two rates applying to substantially the same tax base.

Allowance of Deductions for Local Taxes on Business Buildings occupied by Owners.—Under the rulings of the Department, deduction 6 (Form 7) is so interpreted as to disallow as a deduction local taxes on a business building occupied by the owner. The clause reads: "For municipal taxes and rates paid on real property, from which an income is derived, but not otherwise."* It would seem better practice to interpret the law so as to consider a business building occupied by the owner as a piece of property "from which an income is derived." The present ruling gives the business-man who rents his premises an unfair advantage over the man who owns his place of business.

Allowance of Deductions for Bad Debts.—The present law permits deductions for "losses and bad debts arising out of the business from which an income is derived, irrecoverable and actually written off during the year, but not otherwise."† The language is somewhat indefinite, but it has been so interpreted as to refuse deduction except in cases where the losses arise out of liabilities originating in the current year. This obviously brings about a ridiculous state of affairs. If the tax is to be on net income, deductions should be permitted for all losses because of bad debts, not for merely a portion of them determined in any such fashion. Proper allowances may be made in one of two ways. The first and, on the whole, the preferable method is to allow the deduction of a contingent fund to meet bad debts. This is done under the English income law.‡ The other method is to permit deductions for all losses as they actually occur. This is the practice under the United States Federal§ law and the Wisconsin law.‖ There would be little difference in the financial yield between the two methods.¶

The redefinition of taxable income in the manner suggested in the preceding sections will bring about a more equitable and generally satisfactory income-tax. Most of the points resolve themselves practically into questions as to whether the Province can afford financially to adopt them. However, in considering the financial effects of refinements in the income-tax law, it is well always to bear in mind the possibility of the changes inspiring a fuller co-operation by taxpayers, with a consequent improvement in administration and money yield.

INCOME-TAX RATES.

Recent Changes in Rates.—Historically the income-tax in British Columbia has been elastic and variable, the rates being changed very frequently.** In 1897 incomes over $1,000 were taxed from 1¼ to 1¾ per cent. In 1901 the Legislature increased the progression, the rates being made to range from 1½ to 4 per cent., the highest rate applying to portions of incomes in excess of $40,000. Two years later, in 1903, there was a slight reduction by which the highest rate was made 3 per cent. In 1905 the rates were raised once more, the range being from 1½ to 4 per cent., the highest rate applying when the taxable income exceeded $7,000. These rates stood until 1910, when a slight reduction established the schedule which was maintained until the changes of last year.

* "Taxation Act," Form 7.
† Form No. 7, deduction No. 4.
‡ Montgomery, *op. cit.*, page 186.
§ *Ibid.*, page 184 *et seq.*
‖ The Wisconsin Income Tax Law, page 14.
¶ The adoption of the first would involve the amendment of section 76, subsection (8), of the "Taxation Act."
** *Cf.* Vineberg: Provincial and Local Taxation in Canada, page 73 *et seq.*

The Legislature in 1917, therefore, found the following income tax rates in force:—*

	Per Cent.
Class A—First $2,000 of taxable income	1
Class B—When income is more than $2,000 and not more than $3,000	1¼
Class C—When income is more than $3,000 and not more than $4,000	1½
Class D—When income is more than $4,000 and not more than $7,000	2
Class E—When income is more than $7,000	2½

This range of rates is illustrated by Graph VIII., which sets forth also the increases established for the year 1917 by the surtax legislation and the range decided upon for the year 1918 and thereafter. The radical nature of the increases becomes immediately apparent. Rates on incomes of $10,000 or more (taxable income) were doubled for 1917 and trebled for 1918. Incomes of more than $20,000 were called upon for doubled taxes in 1917 and quadrupled taxes in 1918. The highest rates, 12½ per cent. on incomes of more than $50,000 for 1917, represent taxation five times as high as existed in 1916 and more than three times as high as ever before existed in the Province.†

These radical increases in the rates would of themselves appear to invite sufficiently serious administrative difficulties, but the problem is greatly aggravated by the decision of the Federal authorities to impose a Dominion-wide income-tax with highly progressive rates. The combination of this new Federal tax with the increased Provincial tax results in a level of rates which is dangerously high from an administrative point of view. A thorough reorganization of the Provincial tax machinery is imperative if an administrative break-down is to be avoided, and there is some ground for doubt as to whether this will be sufficient to meet the situation or whether it will not be necessary also to reduce rates.

The combined effect of the Federal and Provincial income-taxes is set forth in detail in Table A and Graph A, presented in an Appendix.‡ The table§ shows the taxes payable to the Province and to the Federal Government by persons and corporations receiving incomes of varying size, and sets forth the resulting rate upon each person's total income. It will be noticed from an inspection of the graph that the combination of the two taxes results in a very sharply and irregularly progressive tax upon incomes below $40,000. On the larger incomes the progression is more gradual and regular.

It must always be borne in mind that an income-tax assessment depends to a very large degree for its success upon the co-operation of the taxpayer. Very high rates are always powerful incentives to evasion. Under the present scale of rates the single man with an income of $10,000 is asked to pay $845 or 8.45 per cent. of his total income. A $25,000 income involves a levy of $4,270 or 17.08 per cent. A $50,000 income pays $10,170 or 20.3 per cent. in taxes to the Federal and Provincial Governments, whereas last year it paid only $1,212.50 or 2.4 per cent. On the largest incomes the rates approach 39 per cent. Under these changed conditions assessment machinery which worked poorly before can scarcely be expected to prove adequate.

Purely for administrative reasons, therefore, without considering the other effects of the high rates, it is desirable to make a reduction in the present scale of rates at the earliest practicable moment. A patriotic motive is present in the case of the Federal tax which will undoubtedly be a powerful aid in the administration of that law. But the absence of this motive in the Provincial tax, together with the high level of the Federal rates, makes the Provincial problem doubly difficult. Only a test will show whether the rates are too high to be successfully maintained, but the prospect contains plentiful cause for apprehension.

Aside from the question of difficulties involved in administering the income-tax law under the present high schedule of rates, there is the question of the burdensomeness of the rates upon the taxpayers. The testimony before the Taxation Board reveals considerable uneasiness on this score also.

The Initial Exemptions.—The present initial exemption of $1,500 is extended indiscriminately to single men, married men, and to corporations. A differentiation is usually made among these classes and might well be introduced in British Columbia at this time, particularly in view of the increased rates of the income-tax and the proposed elimination of the personal-property tax. It is suggested: (*a*) That the exemption for single persons without dependents be reduced from

* The initial exemption having been changed to $1,500.
† Assuming that the rates did not exceed 4 per cent. before 1897.
‡ *Cf. infra*, pages 129, 130.
§ This assumes that the definition of taxable income is the same under both laws.

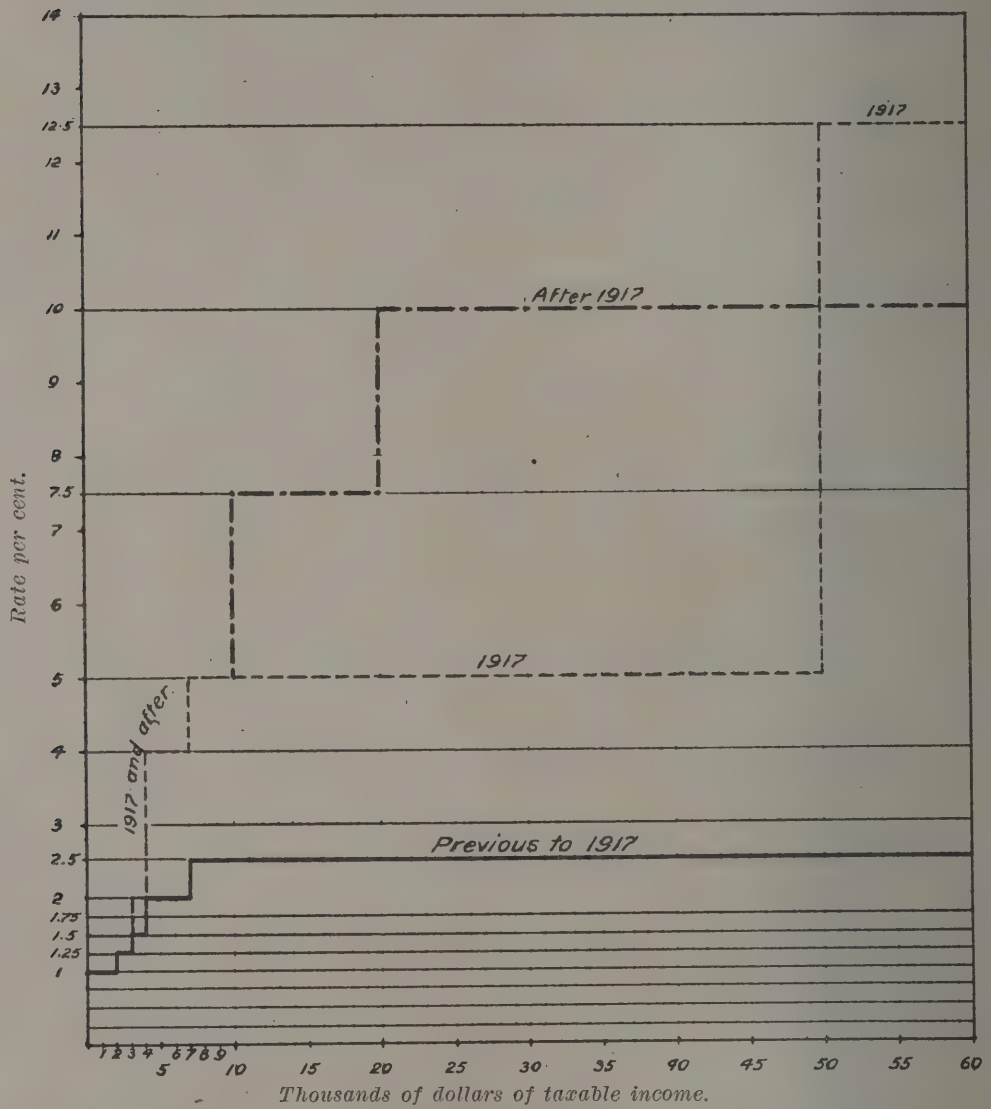
(Taxable Income is the Income above the Initial Exemption of $1,500.)



$1,500 to $1,000; (*b*) that the exemption for man and wife be retained at $1,500, but (*c*) that an additional exemption of $200 be permitted for each child or other person actually supported and entirely dependent. These initial exemptions are formulated on the theory that justice demands that a certain minimum of income should be allowed to the family unit before any tax burden of this type is imposed, and it is obvious that the amount of this minimum should not be the same amount in the case of a single man without dependents as in the case of a married man with a large number of children. Finally, it is believed (*d*) that the initial exemption now extended to corporations could well be entirely abolished. This would bring the law into accord with the general practice. The same reason does not exist for the exemption in the case of corporations as exists in the case of individuals.

The effects of these suggested changes in exemptions, taken in conjunction with the proposed alterations in the income-tax rates, are set forth in detail in Appendix B.*

* *Cf. infra,* pages 128 *et seq.*

The Readjustment of Present Rates.—As has been pointed out, it is very desirable that the income-tax rates be radically reduced at the earliest practicable moment. But even though an immediate reduction should prove to be impracticable, the present rates should nevertheless be so readjusted as to bear more evenly upon the taxpayers. In the table which follows, the rates as they now stand are compared with a suggested schedule which is designed to eliminate some of the crudities of the present schedule without seriously affecting its productivity.

The practical effects of the adoption of this modified schedule of rates, taken in conjunction with the suggested alterations in the initial exemptions, are set forth in detail in Appendix B.*

Table X.—Income-tax Rates at Present in Force, with Suggested Modifications.†

	Per Cent.
At present—	
Class A—First $2,000 of taxable income	1
Class B—When income is more than $2,000 and not more than $3,000	1¼
Class C—When income is more than $3,000 and not more than $4,000	2
Class D—When income is more than $4,000 and not more than $7,000	4
Class E—When income is more than $7,000 and not more than $10,000	5
Class F—When income is more than $10,000 and not more than $20,000	7½
Class G—When income is more than $20,000	10
Suggested modifications—	
Class A—First $2,000 of taxable income	1
Class B—When income is more than $2,000 and not more than $3,000	1½
Class C—When income is more than $3,000 and not more than $4,000	2
Class D—When income is more than $4,000 and not more than $5,000	3
Class E—When income is more than $5,000 and not more than $7,500	4
Class F—When income is more than $7,500 and not more than $10,000	5
Class G—When income is more than $10,000 and not more than $15,000	6½
Class H—When income is more than $15,000 and not more than $25,000	8
Class I—When income is more than $25,000	10

The Reduction of Income-tax Rates.—The immediate reduction of the income-tax rates is urged by many interests in the Province. Thus, one of the suggestions of the Vancouver Board of Trade is that the recommendations of the Royal Commission on Taxation of 1911 be adopted in place of the present rates, with the qualification that the supertax be made to apply only to individuals and not to corporations. The Royal Commission's scale of rates is as follows:—‡

Class A—When the income of a person does not exceed $3,000, 1 per cent., with an exemption of $1,500.

Class B—When the income of a person exceeds $3,000 and does not exceed $4,000, 1¼ per cent., with an exemption of $1,500.

Class C—When the income of a person exceeds $4,000 and does not exceed $5,000, 1½ per cent., with an exemption of $1,500.

Class D—When the income of a person exceeds $5,000 and does not exceed $8,000, 2 per cent., with an exemption of $1,500.

Class E—When the income of a person exceeds $8,000 and does not exceed $11,500, 2½ per cent., with an exemption of $1,500.

Class F—When the income of a person exceeds $11,500 and does not exceed $50,000, 2½ per cent., with no exemption.

Class G—When the income of a person exceeds $50,000, 2½ per cent., with no exemption, and also a supertax of 5 per cent. on all income beyond $50,000.

As will be seen by referring to the detailed chart and the graph presented in Appendix B,§ the adoption of the scale recommended by the Commission would result in a more regular and even progression in the rates than now obtains. The reduction in the burden on the moderately large incomes ($15,000 to $50,000) is more substantial than in the very large incomes. But the rates of the Commission would yield substantially smaller returns than the present rates, but

* *Cf. infra*, pages 131, 133.

† Single rate applies to entire taxable income, the rate to be applied being determined by the group within which the income falls.

‡ Synopsis of Report and Full Report of Royal Commission on Taxation, 1911 (Victoria, 1912), page B22.

§ *Cf. infra*, pages 134, 135.

how much smaller cannot be definitely stated because of the lack of data showing the income-tax assessment by classes of income.* If the Province can afford a substantially lower scale, it would do well to adopt the recommended rates of the Royal Commission of 1911.

The present rates are very likely to prove to be disappointing in their fiscal results because of their great height. Excessive income-tax rates undoubtedly induce evasion, and evasion of such taxes is not difficult even under better conditions of administration than exist in British Columbia. Here again experience must be the guide. If the high rates prove to be demoralizing, they must be lowered and the money sought by some other method.

The Differentiation between Rates on Corporate and Rates on Individual Incomes.—The present income-tax law imposes precisely the same rate on corporate incomes as on individual incomes. The Vancouver Board of Trade petitions for a change in this policy, suggesting that the highest rates in the progressive scale apply only to personal and not to corporate incomes. The effect of this would be to make the maximum rate on corporate incomes 2½ per cent. instead of 12½ per cent. as in 1917, or 10 per cent. as contemplated for 1918 and thereafter.

The question as to whether there should be a differentiation in the rates as between corporate and other incomes is one of the hotly controverted points in public finance. There are those, on the one hand, who assert that the application of progressive rates to corporate incomes cannot be justified.† On the other hand, it is urged by others that the application of the progressive principle in this case is not only desirable, but is positively essential to the establishment of a sound system.‡ The argument of those who oppose progressive rates on corporate incomes centres about the contention that the income-tax on corporations is in reality a business-tax; that the business is owned by the stockholders, to whom the profits belong; that the proper place to apply progressive rates is upon individual incomes of which the dividends form a part, because ability to pay or burdensomeness cannot be satisfactorily measured by mere size of income in the case of corporations as it can in the case of individuals. The strongest argument for progressive rates on corporate incomes appears to be that which supports the plan on the theory that such an arrangement is conducive to progress. Most large enterprises were once small and struggling concerns, runs the argument, and great care must be taken lest the large and successful business enterprises of the future are not stifled in their present formative stages by too heavy taxation. Therefore, if it is necessary to raise large sums by taxing businesses, the burden should be made relatively heavy for the large, well-established concerns and relatively light for the small, struggling concerns.

In the case of British Columbia the argument last presented has less force than it would have in most situations, for in this Province it is not generally true that new concerns are small and that the big, successful enterprises grow from small, struggling ones through a process of gradual development. Rather, the large enterprises, the mining and lumber companies, for example, are normally of great size from the very beginning of their activities. Therefore the problem of encouraging enterprises in British Columbia is not merely the problem of encouraging small concerns, but is also the problem of encouraging large corporations to undertake very expensive developments.

But, on the other hand, the Province cannot depend upon progressive rates levied on individual incomes to meet the situation entirely, for the owners of the business enterprises in the Province reside to a very large extent outside of the Province. The process cannot be one merely of eliminating the high progressive rates on corporate incomes and increasing the rates on individual incomes, for the individual incomes are largely beyond the jurisdiction of the Province. The income must be reached at the source, if reached at all.

The new income-tax imposed by the Dominion Government subjects corporate income to the "normal" rate only (4 per cent.), but the possibility of this tax being supplemented by a new excess-profits tax must be taken into consideration. The Federal income-tax in the United States does not apply a progressive rate to corporate incomes, but in this case there is in existence a very high excess-profits tax. In the State of Wisconsin, which furnishes the closest parallel to conditions in British Columbia, the rates of the income-tax are progressive, and are higher than the rates on individual incomes.

* The assesment data are not summarized by classes of income. This could be done at very slight expense and would aid considerably in arriving at a solution of the problem of rates.

†*Cf.* A. E. Holcomb: Bulletin of National Tax Association, December, 1916, page 59.

‡ *Cf.* discussions of Professors Edwin R. A. Seligman and T. S. Adams in Proceedings of the Annual Meetings of the American Economic Association, December, 1917.

In the present impoverished condition of the Provincial Treasury it would scarcely be possible to reduce the rates on corporate income to the level advocated by the Vancouver Board of Trade. However, in the opinion of the writer, sound policy, under the peculiar conditions present in British Columbia, lies in the direction of a greater degree of uniformity in the rates applying to corporate incomes. Of course, the lower this general level of rates, the more attractive will be the Province as a field for the investment of capital in enterprises of development. The rates on corporate income may well be considered in a separate category from those on individual incomes, and be determined primarily upon considerations which have to do with the problem of attracting capital on the one hand and the need for revenue on the other.

The Application of the Income-tax.

As has been pointed out, the present tax system consists of a set of general taxes, of which the income-tax is one, coupled with a set of special taxes which are sometimes imposed in substitution for the general taxes and sometimes not. In other words, the income-tax is not universal in its application, certain types of enterprise being specifically exempted from its provisions. Again, the income accruing to individuals from the dividends of corporations paying income-taxes to the Province is ordinarily deductible in the calculation of personal income-tax returns. But the practice varies regarding the deductibility of dividends from companies subject to the special taxes. Thus salmon-canneries are taxed in a special manner on output and are not taxed on income. This is true also of coal-mines. Until recently the dividends from corporations in both types of business were deductible in calculating personal income-tax returns. At the last session of the Legislature this was changed, so far as canneries are concerned, but was not changed in the case of coal-mines.* At present, consequently, dividends from canneries are taxable as part of the income of an individual, whereas dividends from coal companies are not. Again, before last year, the specific tax on mines (other than coal-mines) operated to exempt the mining companies from the income-tax, and dividends from mining companies were deductible in calculating individual income-tax returns. In 1917, however, the Legislature, by striking out five words from section 255 of the "Taxation Act," brought the mines within the scope of the income-tax law. At the same time, by a change in Form 7, dividends from mining companies were made taxable as personal income. Thus, last year canneries, coal-mines, and metalliferous mines were on the same basis, being taxed by special charges on output, and were not subject to income-taxes. This year coal-mines remain under the old arrangement;† the cannery-owners are made subject to two taxes, because of the new income-tax on dividends; and the metalliferous mines are thrice taxed, for, in addition to the *specific* tax, they pay a new income-tax directly, and the stockholders pay the income-tax on dividends. This irregularity in the application of the income-tax apparently involves a serious lack of equity. A greater degree of uniformity is highly desirable.‡

Specific Taxes.

The specific taxes vary widely in their nature, having little in common, except that they are more restricted in their scope than the general taxes. Their fiscal importance as compared with the general taxes has already been set forth.§ Four are charges upon output, and in reality form a part of the income of the Province from the public domain. But the unit of output and the amount of the charge varies in each case. One of the remaining specific taxes is a property-tax upon a very restricted base; one is a tax on gross receipts of a restricted group of corporations; another is a rate levied upon an arbitrary valuation; one is a restricted "head" or poll tax; another is a tax on consumption, etc. It is difficult to generalize concerning this group further than to point out its heterogeneous character, and to say that it is made of some very good taxes and some very bad ones. Each will be briefly discussed in turn.

Taxes Levied on the Royalty Basis.

The Mineral-tax.—This is a levy of 2 per cent. upon the assessed value of all ore taken from metalliferous mines. The assessed value accepted for the purposes of the Act is the

* *Cf.* "Taxation Act," Form 7, deduction 7; section 8; section 115, subsection (4); section 155.
† With the exception of the slight increase in the rate on Class B coal lands.
‡ The administration of the income-tax is dealt with in another section, *cf. infra,* page 119.
§ *Cf. supra,* page 94.

"smelter return," defined as the gross value after deducting "the cost of transporting the said ore and mineral substances to the smelter or mill and the cost of treating the same."*

As explained, the specific tax was formerly in substitution for income-taxes, but this was changed in 1917,† and the income-tax now applies both to the corporation and to the dividends of such companies forming a part of the taxable income of stockholders.

The Provincial receipts from the mineral-tax for a series of years is shown in Table XI. The largest sum ever received, nearly $300,000, was realized from this source in 1917. This is more than twice the yield of 1915 and three times the yield of 1911. Such excessive variability is a shortcoming of this type of levy. In this particular situation the great increase comes, oddly enough, when revenues from other sources are declining. The explanation is, of course, the abnormal demand for metals due to the war.

March 31st, 1917	287,257 59

The Coal and Coke Tax.—Coal-mine owners pay the Provincial Treasury a royalty of 10 cents per ton on all coal produced, except on coal shipped to coke-ovens in the Province. Owners of coke-ovens pay a tax of 10 cents per ton upon all coke produced.‡ Several years ago the rate upon coke was 15 cents. The equal rate per ton on coal and coke is defended by coalmen on the ground that the difference in the quality of the coal used for coking purposes makes up for the difference between the weight of a ton of coke and the weight of the coal entering into it.

The receipts from this tax, shown in Table XII., exhibit considerable variability. Less money was received from this source in 1917 than in 1910. The yield in 1913 was 50 per cent. larger than four years later, in 1917, but a part of this difference is explained by the change in rates.

March 31st, 1917	194,536 62

Timber Licences and Royalties.—The various types of charges imposed upon timber are essentially specific taxes in their nature, but they are not considered a part of the tax system proper, probably because it has been found desirable to place them under a separate administrative organization. The accounts still show a small return from an old form of timber lease, long since abandoned.§ For a considerable period charges were imposed in the form of licence fees payable for the privilege of cutting and in the form of royalties upon the amount of timber cut. Revenue still accrues in large amounts from these sources, but the current method of

* "Taxation Act," section 160. Ore-producing mines whose output is of less value than $5,000 receive a rebate of one-half of the tax. Placer and dredging mines with a product of less than $2,000 are tax-free.

† *Cf. supra*, page 109.

‡ "Taxation Act," sections 119, 120.

§ Pulp-wood leases are still issued.

levying a charge for the privilege of utilizing the timber resources of the Province is to cruise the land and sell the privilege upon the basis of the report of the cruise.*

In the accounts the receipts from timber royalties are not stated separately from the receipts from licences, although the charges are sufficiently different to justify the distinction. In Table XIII. this separation is made. The royalties are true output-taxes varying with the quantity of timber cut and the prevailing prices. Here once more the variability of this type of charge is very apparent. As in the case of the mineral-tax, 1917 was the banner year, showing an increase of more than 50 per cent. over the previous year. The licences are not output-taxes at all, but are charges levied on the acreage basis. Their productivity was highly uniform until 1915, when a decline began, not because of a diminution in the levy, but because of difficulties of collection. So serious did the pressure become that an Act was passed establishing a moratorium for timber licences for a limited period. This period having now expired, the fees must be paid, and the receipts can be expected to approach normal once more.

† Approximate.

Tax on Canneries and Whaleries.—Salmon-canneries and whaleries were formerly taxed on the basis of their property, but several years ago the charge was changed into output-tax.‡ Canned salmon is subject to a tax of 4 cents a case of forty-eight 1-lb. tins. "Mild-cured salmon" is taxed 75 cents a tierce of 750 lb. or under, and 10 cents per 100 lb. for additional weight. Cured or pickled salmon pays a charge of 15 cents a barrel and "dry-salted" salmon a charge of 5 cents per hundredweight.

Manufacturers of whale-oil are taxed 10 cents per barrel (46 gallons). On fertilizer whale-bone and bone-meal they must pay a rate of 20 cents per ton.

The extensive halibut and herring fisheries are not subjected to an output-tax.

The receipts of the taxes on salmon and whales are not shown separately in the accounts, but a conception of their slight fiscal significance can be gained from the statement that the gross levy in 1917 amounted to only $40,762.64.

In connection with the various taxes on output, there are points which, in the course of even a hasty survey, raise serious questions regarding the advisability of continuing the taxes in their present form. Any readjustment, however, should be based upon a more thorough investigation than it has been possible thus far to make. Full data are needed to establish any relationship between the various rates upon units of output and the real burdens upon the industries affected. Without a clear conception of this relationship no policy can be formulated which is wise and just.

From one point of view this series of royalty charges may be considered a definition of the basis upon which the Province will agree to permit its natural resources to be exploited. Apparently the justification of these charges rests upon the theory that the Province is really the owner of the mines, forests, and fisheries, and permits them to be developed upon the condition that the proceeds be shared in the fashion specified. Whether the charges imposed are proper ones and well adapted to the situation depends partly upon the plan of development to which the Province stands committed. The higher the royalty demanded, the slower, of

* *Cf.* chapter 36, Laws of 1917.
‡ "Taxation Act," sections 114-117.

course, the development which may be expected. Moreover, such royalties are essentially of the nature of bargains with those who are engaged in enterprises of development, and as such they are variable to a less degree than is true in the case of ordinary taxes. It may be desirable to distinguish between new and old enterprises in arranging these charges, in case changes are to be made. Judged by the criteria of justice applicable to ordinary taxes, these royalties have little to commend them.

Because of the lack of opportunity to go into the local situation thoroughly, the writer must refrain from making specific recommendations. The survey made, however, leaves the impression that this is a portion of the field which would repay more intensive cultivation.

OTHER SPECIFIC TAXES.

Tax on Unworked Crown-granted Mineral Claims.—A special penalty of 25 cents per acre is imposed on mining property held by Crown grant and not worked. The tax is of long standing and apparently provokes no opposition. In its nature it is similar to the tax on wild lands and on unworked coal land, and what has been said of the theory of these taxes applies here as well.*

The receipts from this tax, shown in Table XIV., are remarkably constant quantities, but are not important in size.

Gross-receipts Tax.—The following types of corporations, in lieu of taxes on personal property and net income, are subject to a special tax upon their gross income: Insurance companies; guarantee, loan, and trust companies; telegraph, telephone, and express companies; gas, waterworks, and electric lighting, power, and street-railway companies.† It will be noted that this group includes many of the corporations which operate over a wide range of territory, and in such cases gross income constitutes a base much more easily ascertainable for purposes of taxation than net income. The rate upon the gross income of these corporations was formerly 1 per cent. In 1917 it was made 2 per cent. The financial significance of this tax cannot be shown, for, peculiarly enough, no separate statement of the receipts is made in the records of the Province.

Table XIV.—Receipts from the Tax on Unworked Crown-granted Mineral Claims, 1905 and 1910-17.

Year ending—	
June 30th, 1905	$39,869 86
March 31st, 1910	39,869 65
March 31st, 1911	42,020 84
March 31st, 1912	43,436 00
March 31st, 1913	42,733 43
March 31st, 1914	45,953 83
March 31st, 1915	40,296 71
March 31st, 1916	35,703 23
March 31st, 1917	37,903 97

Banks, operating as they do largely through branches, constitute a type of corporation similar to those included under the gross income-tax. But banks are taxed in a special manner. In place of the tax on non-productive personal property and on income (but in addition to the tax on real estate), banks are subject to annual specific taxes as follows:—

For one branch or office	$1,500
For additional branches	250

These rates were not disturbed in 1917 when the rates on other corporations were raised, the banks having agreed to suggest, in time for action in 1918, a more equitable method of distributing the burden among the institutions than the present one. Obviously the system now in force is crude to an unnecessary degree.

* *Cf. supra,* pages 97-8.

† There is a modification of this tax in the case of every corporation "which has its property and business wholly within and confined to this Province and has derived its power by Statutes from this Province, whereby the prices to be charged by it for public services have been limited by any Statute of the Province or by any municipal by-law." Such a corporation pays only one-half the ordinary rate whenever its operating expenses exceed 50 per cent. of its gross revenue in any one year.—"Taxation Act," section 8, subsection (27).

The Railway-tax.—Railways are taxed upon an arbitrary assessment and at an arbitrary rate. The land claimed as right-of-way, the personal property, the income, and the rolling-stock are grouped together as a whole and taxed as real estate. All this property is assessed arbitrarily at $10,000 per mile of main track and branches and $3,000 per mile of sidings, spurs, and switches.* The rate, which formerly was 1 per cent., was increased in 1917 to 2 per cent.† The receipts are not differentiated from the receipts from real estate in general.

The problem of railway taxation in British Columbia is by no means a simple one, with its medley of old companies and new companies, its special exemptions, its subsidies, and its bond guarantees. To tax all railways, however, at the same figure per mile is so rough and inexact a method as to be acceptable only when the tax burden is insignificant. If the railways are asked to bear heavy taxes, a more equitable method than the present one should be applied to apportion the burden among the various companies.

The Revenue or Poll Tax.—Formerly a poll-tax of $3 was an important source of Provincial revenue, yielding in 1912 the large sum of $381,432. The receipts are shown in Table XV. The tax, however, was unpopular, and upon the recommendation of the Royal Commission on Taxation‡ was abandoned in 1913.§ The principal objections to the tax as set forth by the Commission are that it is a primitive tax suited only to the early stages of civilization, and that it has a tendency to obstruct the free flow of labour. These disadvantages, however, did not prove weighty enough to prevent the reintroduction of the poll-tax under the conditions of financial stress present in 1917. The new law‖ provides for the payment of $5 annually by every male person not specifically exempted. The principal exempt class consists of all persons who have paid municipal or Provincial taxes to the amount of $5. This class is so large as to affect very seriously the productivity of the tax. In administering the tax the Province utilizes the employers of labour, who are held liable for the tax and are permitted to deduct the amount from wages. A receipt for taxes paid is the evidence required to secure exemption. In many cases ordinary taxes are not paid until later in the year than the poll-tax, and the problem of rebating poll-tax collections improperly made is one which has caused much vexation both to employers and Provincial officers.

Table XV.—Receipts from the Revenue (Poll) Tax.

Year ending—	
June 30th, 1905	$157,821 00
March 31st, 1910	260,682 00
March 31st, 1911	313,338 00
March 31st, 1912	381,432 00
March 31st, 1913	360,663 00
March 31st, 1914	3,558 00
March 31st, 1915	30 00

This administrative problem would find its solution in the elimination of the taxpayer exemption clause. If the poll-tax is to be retained at all, this action might well be taken.

Some of the objections to the poll-tax arise from the fact that it is considered as a tax by itself rather than as part of a tax system. Here it might possibly be considered as a part of the income-tax—as a minimum income-tax payable by those whose incomes are so small as not to justify the administrative expense of drawing up a declaration. The strongest support for the tax in British Columbia, however, appears to come from those who consider it a means for reaching certain classes in the community who are reached by taxation in no other way, particularly the Orientals. So far as the primitiveness of the tax is concerned, the great bulk of the Province can scarcely to-day be considered to have reached a high level of economic development.

After all is said and done, however, there is little enough excuse for the existence of the tax. The elimination of some of the exemptions would simplify the administration, increase the yield, and improve the equity of the tax. But it is one of the least desirable of the forms of taxation being utilized at present, and should be definitely slated for repeal as soon as the state of the Provincial finances will permit.

* Buildings used for other than railway purposes are taxed as ordinary real estate.

§ Laws, 1913, chapter 71, section 11.
‖ The "Poll-tax Act," assented to May 19th, 1917.

Succession Duties.—As is shown in Table XVI., very considerable sums have been received annually from probate and succession duties. Rates formerly ranged up to 10 per cent. The present scale of succession duties, ranging up to 20 per cent., were adopted in 1917.* There is a probate duty on personal property which varies from nothing in the case of the closest relatives to 5 per cent. to the group furthest removed.

These rates, although not so high as those resulting from the combination of the Federal and State rates in some places in the United States, nevertheless compare favourably with the rates in many of the foreign countries, and justify careful safeguards, such as provisions guaranteeing against the repeated payment of the tax on the same estate within a few years. One of the assets of British Columbia is its attractiveness as a place of residence, and the Province has a special problem in that care must be exercised lest high inheritance-taxes prove a bar to wealthy home-seekers.

Table XVI.—Receipts from Succession Duty, 1905 and 1910-17.

Year ending—	
June 30th, 1905	$ 31,073 08
March 31st, 1910	108,495 39
March 31st, 1911	200,459 88
March 31st, 1912	152,243 93
March 31st, 1913	193,523 90
March 31st, 1914	249,275 37
March 31st, 1915	162,277 60

March 31st, 1917	277,702 73

The Motor-tax.—The owners of motor-vehicles in British Columbia are taxed in a manner which is unnecessarily complicated and expensive. There is a $10 registration fee paid once only, and a $10 licence fee paid annually. In addition, the machine is taxable as personal property. Table XVII. shows the receipts under the "Motor-traffic Regulation Act," which do not include the personal-property taxes on motor-cars, but do include certain other fees than merely the registration and licence fees.

Table XVII.—Receipts from the "Motor-traffic Regulation Act."

Year ending—	
March 31st, 1914	$ 98,530 76
March 31st, 1915	110,446 43
March 31st, 1916	94,892 30
March 31st, 1917	134,361 50

It is recommended that all of the three charges now levied be merged into an annual licence fee which will vary the type of motor-vehicle, but which is estimated to yield in all approximately the same revenue as the present miscellaneous charges. Under the present arrangement there is not sufficient differentiation between the owners of the various classes of motor-cars, and there is too much difficulty in administering the personal-property tax as applied to automobiles. It is believed that the suggested change will make the charges more equitable, will tend to eliminate evasion, and will reduce administrative expense.

The Amusement-tax.—In 1917 a tax upon amusements was introduced in British Columbia.† It provides that every person attending a performance at a place of amusement shall pay a small tax based on the price of admission, as follows:—

Price of Admission.	Tax, Cents.
Not more than 5 cents	1
More than 5 cents but less than 15 cents	2
More than 15 cents but less than 25 cents	3
More than 25 cents but less than 40 cents	4
More than 40 cents but less than 75 cents	5
More than 75 cents but less than $1.25	10
More than $1.25 but less than $1.50	15
More than $1.50 but less than $2.00	20
More than $2.00 but less than $2.50	25
More than $2.50	50

* Laws of 1917, chapter 60.
† Laws, 1917, chapter 63.

These rates, although somewhat differently arranged, are not appreciably higher on small admissions than the rates in force in the adjoining territories of Alberta and the United States, the rate in the United States being 10 per cent. of the admission charge, and in Alberta 2½ cents per ticket, provided the charge is less than $1.

The amusement-tax is, in the opinion of the investigator, a very undesirable form of tax, and one which should be abandoned entirely as soon as the condition of the Treasury warrants it. It might be justified as a war measure designed to discourage a non-essential enterprise, but no effort is made to justify it on this basis in British Columbia. Here it is merely a revenue measure, and, as such, care should be exercised lest the level of rates or their arrangement discourage the business and impair the source of revenue. It is asserted by the motion-picture interests that the present rates operate to discourage patronage. If this is true, and it should be possible to demonstrate the truth or falsity of the statement, it is to the interest of the Government as well as to the interest of the business that the rates be revised.

This tax is of a type which usually produces irritation entirely out of proportion to its yield, and which distributes the burden with reference to no defensible principle of taxation. Where most successful, the irritation is usually alleviated by making the tax a special one whose proceeds are devoted to some particularly popular purpose. Thus in Alberta (perhaps improperly so) and in the United States the amusement-tax is known as a distinctively war-tax, while in Montreal the city's share of the proceeds goes to the support of hospitals. In British Columbia it might be arranged so as to make the tax a patriotic levy or a charge to assist in carrying the railway-bond burden, on the theory that this would bring home to the people the undesirable results of reckless financing.

The foregoing discussion* has proceeded from the point of view of the revenue system as a fiscal machine, and has therefore concerned itself narrowly with types of taxes, the level of rates, and the money yields, reserving the broader questions of the distribution of the tax burden for treatment in the succeeding sections. Some general observations should, however, be made at this point.

It is apparent that, as it now stands, the tax system is a bewildering complicated mixture of good and bad features. There is much that is worthy of praise, for a persistent effort has apparently been made to appropriate new developments in the field of taxation. On the whole, however, the tax system as it stands must be described as exceedingly rough and crude. The income-tax is really scarcely an income-tax at all, so inexact is the definition of income laid down in the law. The special tax on banks does not differentiate between the prosperous and the unsuccessful institution, provided only they both have the same number of offices. The railway-tax does not distinguish between the railroad which pays enormous dividends and the road which is in the hands of the receiver, provided they both have the same number of miles of track. Two coal-mines pay the same tax if they turn out the same number of tons of coal, although one may be making much money and the other none whatsoever. Some of the rates are so adjusted as to defeat the very purpose of the tax, as in the case of the wild-land tax, the raising of a revenue for the Province.

Improvement in the tax system should take the direction of the simplification and co-ordination of the taxes already in existence rather than the addition of new types of imposts. There are too many kinds of taxes in force already. A properly developed and administered income-tax, for example, should make it possible to eliminate or merge with it the personal-property tax as well as a number of the specific taxes.

It is definitely recommended that several of the taxes be entirely eliminated as soon as this action can possibly be afforded; e.g., the poll-tax, the amusement-tax, and the personal-property tax. It is also pointed out that the rates being levied in at least two cases—i.e., the income-tax and the wild-land tax—are so high as to be unsafe. At the present level they endanger the integrity of the financial system.

* The following points have been suggested as worthy of study with a view to changes, but the writer has not been able to consider them because of lack of time:—

(1.) *Registry Fees.*—It has been suggested that the amount of these fees be made to vary with the increase in the value of the land between transfers, the fees, however, being kept so low as to cause them to remain essentially fees rather than taxes.

(2.) *Water Revenue, Rentals.*—The administration of these rentals is said to be susceptible of considerable improvement which, if accomplished, would result in increased revenue.

(3.) *Timber Leases and Licences.*—Both leases and licences are transferable and often appreciate greatly in value. It has been suggested that there may be a basis here for the imposition of an increment tax.

The need for revenue is so great that recommendations for changes in the tax system are conditioned fundamentally upon their financial practicability. Most of the suggestions made at the hearings were in the direction of reducing rather than increasing the productivity of the taxes. The really important question is what refinements the Province can at this time afford to make, and this is a point for the Government rather than for the investigator to decide.

THE DISTRIBUTION OF THE PRESENT TAX BURDEN.

Turning from a survey of the tax system strictly as a revenue-producing machine, attention is directed to a broader aspect of the problem—that connected with the distribution of the tax burden. As the result of the imposition of the various taxes described above and the division of taxing powers among the various governmental authorities, what are the results obtained in terms of burdens imposed? And how closely does the weight of these burdens coincide with ability to bear taxes?

THE DISTRIBUTION AMONG THE VARIOUS ECONOMIC INTERESTS.

The scientific reorganization of the tax system presupposes definite knowledge of conditions. If the burden is to be readjusted so as to rest where it can most easily be borne, it is necessary to have full and exact information regarding the local situation. Since the investigator did not have the opportunity to acquire this detailed information, he is not in a position to proceed in a confident manner to outline a comprehensive scheme of reorganization. What is needed is a field investigation which would inquire carefully into the effects of the present system upon the various economic interests, and which would gather data for forming estimates of the probable effects of adopting various possible readjustments.

How the present system could be expected to result in an equitable distribution of the tax burden is beyond the comprehension of an unbiased observer. Even a brief examination of the nature of the various taxes imposed and of the history of modifications made in those taxes is sufficient to convince one that the tangled web of special charges and special exemptions conceals very serious inequalities.

To make comparisons it is necessary to reduce the elements to some common basis. Where a single tax is applied uniformly comparisons are readily made. But under the British Columbia tax law almost every interest is taxed upon a different basis and at a different rate. The assessment and tax data yield almost no information for drawing conclusions as to relative burdens. An inquirer who would know whether the coal-mining industry is heavily taxed as compared with the metal-mining industry must combine the various miscellaneous charges resting on each, and compare them with data regarding the economic strength of the industries gathered from some other source than the tax records. The fact that salmon-canneries are taxed 4 cents per case on output tells nothing concerning the relative weight of the burden borne by this interest compared with that borne by banks. But it is difficult to escape the conclusion that coal-mines taxed merely on the royalty basis are equitably treated as compared with metalliferous mines, which, in addition to royalties, pay taxes on income and dividends. And it is not easy to see the equity in increasing 50 per cent. the taxes on Crown-granted timber lands when the charges are not increased upon timber companies drawing their supply from other sources than Crown-granted lands.

The simplification of the taxes and the equalization of the burden should be one of the tasks entrusted to a capable permanent Tax Board. To this Board should be given power to secure expert advice concerning the many highly technical problems involved.

THE DISTRIBUTION BETWEEN THE PROVINCE AND THE MUNICIPALITIES.

The relationship of Provincial and local revenues becomes of great importance in connection with the proper apportionment of the tax burden, and in any readjustment the presence of municipal levies cannot be ignored. Moreover, the Province must have a proper regard for the sources of municipal revenue.

The financial situation in some of the cities of the Province is the occasion of considerable concern. Indeed, unless real-estate values should show a remarkable improvement, the Province may soon be face to face with the problem of extending substantial relief to certain municipalities. The movement toward the single tax, however valuable the social effects may have been in encouraging building or checking speculation, has resulted in the imposition of a strain upon

speculative land-values which has seriously affected their productivity as a source of municipal revenue. If the present real-estate depression continues, it is certain that Victoria, Vancouver, and perhaps some other municipalities will be compelled to reorganize their revenue systems.

At the present time real estate in some municipalities is assessed at levels which are indefensibly high. Moreover, the Province apparently sanctions and encourages this practice. Thus clause (*c*), subsection (227A), of the 1916 amendment to the "Municipal Act" states that in certain districts there shall be no appeal in respect to the assessment "if the assessment of the land in question is fair and equitable in comparison with other lands of the same class in the municipality, such comparison to be made by reference only to the assessment roll of the municipality for the year 1914." In sending out assessment notices, one Assessor naively asserts that "the fact that there is little or no market value for real estate does not affect the assessment." When it is necessary to bolster the assessment by such methods, it is time to arrange for additional sources of municipal revenue.

The situation being as it is, the request of the Vancouver authorities that the right to levy a business-tax be safeguarded the city should be readily granted. Indeed, it is a serious question as to whether it is not now incumbent upon the Province to exercise its authority to compel the municipalities to levy other taxes in addition to the taxes on land-values which are proving themselves so difficult of collection.

In view of the great assistance extended to municipalities from the Provincial Treasury, the application for the remission of a portion of the motor-vehicle fees and the receipts from the amusement-tax is probably not worthy of favourable consideration in the present exigency. It is the current practice in all of the Provinces with which the investigator is familiar to consider the motor licences peculiarly a Provincial source of revenue. In the United States the City of New York has recently secured the remission of a portion of these fees, but it is decidedly an unusual practice. Alberta rebates none of the amusement-tax to municipalities. Quebec, it is true, gives a certain amount of it to Montreal, but this is because Montreal already imposed an amusement-tax which was incorporated into the Provincial system.

The Distribution between the Province and the School Districts.

The burden of supporting schools in British Columbia is assumed to a very large degree by the Province, liberal grants for educational purposes being made even to the most populous and prosperous of the cities. For the year 1915-16 the total expenditure from the Provincial Treasury for school purposes was $1,591,322.43.*

The problem of financing the schools in the outlying districts is one which has occasioned considerable discussion in the Province. Formerly the cost was defrayed entirely from the Provincial Treasury, but recently an attempt has been made to charge a portion of the cost to the locality. The amounts involved are not large, only $122,836.18 having been raised locally in these districts in 1915-16.† Because of the absence of local machinery the administration of the school-tax was made a function of the Provincial Department of Taxes. A tax base, somewhat different from the Provincial tax base, is utilized, and this involves considerable additional labour for the Provincial Assessors. Local school authorities are permitted to request that a certain sum be raised for school purposes and to draw upon the Province for 75 per cent. of the amount. Collections are often slow, and as a result many complaints are made by the local school officials. Finally, the amounts charged to the individual taxpayer are sometimes so small that the expenses of collection exceed the sum involved.

The Provincial educational authorities insist that the importance of the local tax levy in the unorganized school district is very great and resent any proposal to eliminate it. On the other hand, a tax which costs more to administer than it yields is a fiscal absurdity. It may be possible to change the tax base so as to identify it with the Provincial base, eliminating the expense of separate records, notices, etc., and thus reducing the administrative costs to a reasonably small fraction of the yield. If this cannot be accomplished, the suggestion of Mr. McKilligan should be adopted—viz., that the expenses of the schools in these districts be made a charge payable out of general Provincial funds, but made good by an increase in the levy upon the real estate in the unorganized territory as a whole.

* Public Schools Report, 1915-16, page 15.
† Public Schools Report, 1915-16, pages 15, 17.

THE ADMINISTRATION OF THE TAX SYSTEM.

Already several administrative questions have been referred to incidentally.* It is now proposed to discuss as fully as the available data will permit the general question of the degree of success attained in the administration of the tax laws of British Columbia, and to suggest certain changes which it is believed will increase the efficiency of the organization.

ASSESSMENTS.

Quality of Assessments.—The efficiency of the administrative organization is to be judged by the fulness and accuracy of assessments and the promptness and completeness of collections. On neither count can the administration in British Columbia be said to have achieved success.

Although lack of time made it impossible to conduct an extensive, first-hand investigation into the quality of the assessment, the testimony of witnesses who appeared before the Board, together with the frank admissions of various officials, convince the investigator that the assessment, particularly of personal property and income, is open to very serious criticism. It is apparently a matter of common knowledge that the Provincial officials with their present organization are impotent to secure full and accurate income and personal-property returns. The testimony regarding the quality of the real-estate assessment is somewhat conflicting, but evidently there is considerable unevenness. There are complaints concerning overvaluation, some of which are based on the ground that there have not been reductions recently to meet the slump in realty values. But the officials contend that they were very conservative in raising values during the prosperous years and that present values do not on the whole represent an overvaluation.

The Present Assessment Force.—No substantial change has been made in the machinery of assessment for fifteen years. The administration is headed by a Surveyor of Taxes and Assessments who has the assistance at headquarters of a single clerk and stenographer.† The Province is divided into thirty assessment districts, with an Assessor at the head of each. In the districts which include a city the Assessor is usually provided with assistants. In many districts, however, not only is no assistance furnished, but the Assessor, in addition to his tax duties, is burdened with numerous other functions. It is pointed out by Mr. McKilligan that the assessment force from top to bottom is inadequate to the task of accomplishing satisfactorily the work assigned. Many of the Assessors are said to be able to do little in the way of revision and merely copy the rolls from year to year without alterations.

A Permanent Tax Board.—It is imperative that an administrative organization be built up which is capable of solving the difficult assessment problem of British Columbia. In the opinion of the writer, there should stand at the head a permanent Tax Board of dignity, power, and responsibility. Such bodies have commended themselves as the result of long and varied experience in two-thirds‡ of the States of the Union. The administrative Boards in control of taxation in such States as Wisconsin, Michigan, New York, and Kansas furnish examples of the general character of the organization which is desirable. The tax problems of the Province are many, and the work is of sufficient importance to justify the creation of such a Board.

The Board should be composed of three members, appointed by the Lieutenant-Governor in Council for a term of at least four years. The salary should be sufficient to attract men of good calibre. Every effort should be made to render the Board independent and non-political, and to this end it might be well to follow the precedent of Saskatchewan, where the members of the Local Government Board are disfranchised upon the acceptance of their appointments.

To this Board should be granted wide powers and adequate funds.

The Reorganization of the Assessment Force.—The administrative organization which will best meet the demand for a more complete and exact assessment is a problem which should be left to the Tax Board so far as details are concerned. If the personal-property tax were abolished and the income-tax administration merged with the Federal machinery, the remaining problem of real-estate assessment could probably be best met by a corps of trained men devoting their entire time to the work, working under central direction and control. This would involve, of course, the entire reorganization of the present assessment districts.

---

* *Cf. supra,* under the various headings.
† Recently steps have been taken to provide an assistant and a temporary auditor.
‡ In thirty-five out of the forty-eight States in 1916.

Appeals of Dissatisfied Taxpayers.—At present appeals from assessments are heard by a Judge especially appointed for the purpose and paid on the per diem basis. The results obtained under this arrangement are reported to be unsatisfactory. The consideration of appeals and the revision and equalization of the local assessments might well be made a part of the work of the Tax Board, the members of which might act with or without the co-operation of local representatives. Further appeal to the Supreme Court of the Province should be retained, as at present.

Separate Assessment of Lands and Improvements.—A measure whose adoption could be confidently expected to yield a greater degree of accuracy in real-estate assessments is the requirement that in assessing real estate the value of the land be stated separately from the value of the improvement. At present the value of the entire improved parcel is entered as one item.

Assessment Costs.—The accounts of the Province are not so arranged as to make possible a statement of the expense involved in the assessment procedure.

Utilization of Federal Income-tax Machinery.—It is possible that the presence of the new Federal income-tax can be made to assist to some degree in the administration of the Provincial income-tax. It is desirable that some plan of co-operation be adopted which would make it possible to utilize the same return for both Federal and Provincial income-taxes. Provided the combined rates were not inordinately high, the plan should prove advantageous to both Governments and to the taxpayer, preventing evasion on the one hand and eliminating the inconvenience of two returns on the other. An amendment to the Federal law permitting the use of the Federal returns by Provincial income-tax officials would be the best method of gaining the end in view, but it could be accomplished in a fairly satisfactory manner by requiring each Federal income-tax payer in the Province to submit to the Provincial authorities a copy of his Federal return. The last plan is being used successfully in connection with the taxation of corporations in the States of Connecticut and New York.

COLLECTIONS.

The measurement of the degree of success achieved in collecting taxes is usually the simple process of comparing the collections with the levies. But, strange as it may seem, in British Columbia it is not possible to make this comparison exactly with the data available from the Provincial records. It has apparently been the practice to measure success of collections by comparing collections of one year with collections of preceding years rather than by comparing collections with levies!

Taxes are due January 2nd.* A discount of 10 per cent. is given if payment is made before July 1st. They become delinquent December 31st† and bear interest after that date at the rate of 6 per cent. per annum.‡

It will be noted that the tax-collection period does not coincide with the fiscal year. This causes confusion, for the receipts shown in the Public Accounts for a given fiscal year include portions of the levies of several years. Thus any taxes which are paid during the first three months of the new tax year are merged with the taxes received during the nine months of the old tax year, and in addition no distinction is drawn between receipts from the levies of the (two) current tax years and the receipts from the levies of previous tax years, now in arrears. Consequently close comparisons between levies and collections are impossible. If the tax year were made to coincide with the fiscal year, and the tax receipts allotted by the year of levy, definite information would be available concerning the efficiency of the collection service. At the present time to secure a statement of taxes outstanding it is necessary to send a special request to all Collectors, who must then make up the statement from their books.§

The Amount of Arrears.—Great difficulty has been experienced of late in collecting taxes, and the arrears have now reached alarming proportions. It was reported by the special auditors that on November 30th, 1916, the total outstanding taxes amounted to $3,804,794.21.‖ This

* "Taxation Act," section 105.
† "Taxation Act," section 211.
‡ "Taxation Act," section 212.
§ The numbered receipts issued by the Collector constitute practically the only system of control over the Collector, and this is so indirect as to be but little insurance against irregularity. Good financial practice demands that the Collectors be directly charged with the responsibility of accounting for definite sums, and that control be exercised to an extent sufficient to enforce this responsibility.
‖ This figure, moreover, did not include an item of $166,502.96, outstanding taxes for rural schools.

included the outstanding taxes of the current year's levy, which could not properly be termed arrears until the end of December. But December collections did not materially reduce that amount, and the total arrears on January 1st, 1917, stood at $3,698,195.18, distributed as follows:—

Table XVIII.—Total Accumulated Arrears, January 1st, 1917 (compared with 1916 Levy).

	1916 Levy.	Total Accumulated Arrears.
Improved real estate	$ 686,688 31	$ 537,296 24
Wild, coal, and timber lands	1,262,825 79	2,681,894 77
Personal property	343,644 23	249,455 18
Income	350,045 80	229,548 99
Totals	$2,643,204 13	$3,698,195 18

The total accumulated arrears are contrasted with the current levies for 1916 in Graph IX. It will be noted that the arrears outstanding at the first of this year exceeded by approximately 25 per cent. all of the taxes levied on these classes of property in 1916. Taxes on income have shown themselves to be the most collectable of all the taxes, but even in this case the total arrears exceeded 65 per cent. of the current year's levy. That this is not a creditable showing will be realized by comparing the figures with those for the State of Wisconsin, where the total accumulated income-tax arrears amounted on June 30th, 1916, to only $105,286.73, less than 2 per cent. of the 1916 levy.*

Personal-property arrears amount to approximately 70 per cent. and improved real estate arrears to almost 80 per cent. of the current levy. The weakest element in the tax base, however, is also the one upon which chief dependence is placed, the taxes on wild, coal, and timber lands. Here the accumulated arrears are now more than twice as great as the current year's levy.

The seriousness of the situation may become very strikingly apparent from a consideration of the statistics of current arrears. Of the taxes levied in 1917, nearly one-half were not collected within the legal period and lapsed into arrears.† The accompanying table (Table XIX.) and graph (Graph X.) show that in the case of wild, coal, and timber lands the taxes collected amounted to only one-third of the levy. The income-tax again appears to have the best record, with personal property and improved real estate following in order.

Table XIX.—Portion of 1916 Tax Levy going into Arrears on January 1st, 1917.

	1916 Levy.	Arrears of 1916 Levy.
Improved real estate	$ 686,688 31	$ 200,114 02
Wild, coal, and timber lands	1,262,825 79	798,070 77
Personal property	343,644 23	82,834 34
Income	350,045 80	48,845 91
Totals	$2,643,204 13	$1,129,865 04

That this is a condition which has not always existed, but is rather one which has gradually developed until it reached its present large proportions, is shown by the data presented in Table XX. and Graph XI. Here the total annual levies are compared with the cash receipts for the fiscal years. Although the nature of the data makes this comparison a somewhat unsatisfactory one,‡ it is possible to draw general conclusions. It is very evident, for example, that the habit of not paying taxes is becoming more general with each year, and that, whereas eight years ago it was a question of no quantitative importance, it has grown to be a matter of serious financial concern.

* A large share of these arrears were unpaid merely pending the result of litigation.—Report of the Wisconsin Tax Commission, 1916, pages 58, 65.

† The total current year's levy ($2,643,204.13) minus the cash discount (maximum $264,320.41) equals $2,378,883.72. The arrears at the end of the year were $1,129,865.04. The amount paid, ignoring the added amount because of the discount not available after July 1st, was therefore $1,249,018.68.

‡ This is because the receipts are not receipts from the current year's levy merely, but rather include other elements.

Graph IX.—Total Accumulated Arrears at End of 1916 compared with the Tax Levy for 1916.

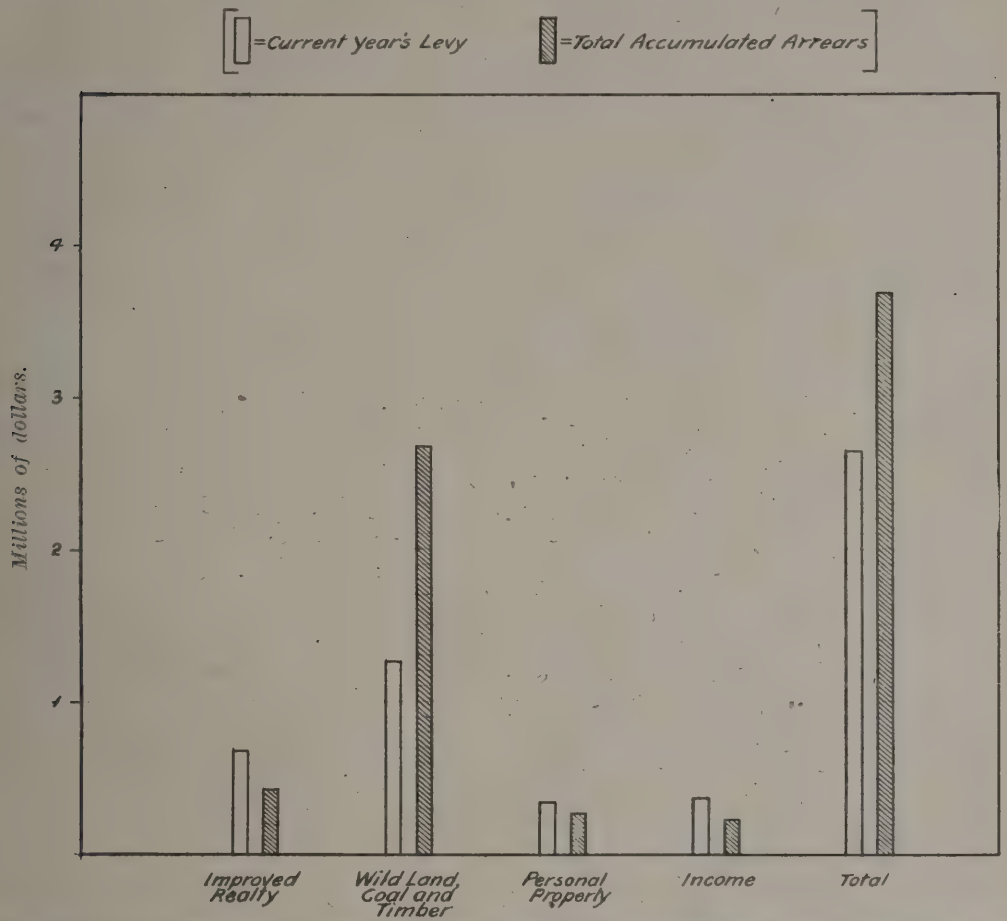

Table XX.—A Comparison of the Total Tax Levies on Improved Real Estate, Wild, Coal, and Timber Lands, Personal Property, and Income, with the Total Cash Collections from these Sources by Fiscal Years, 1909-17.

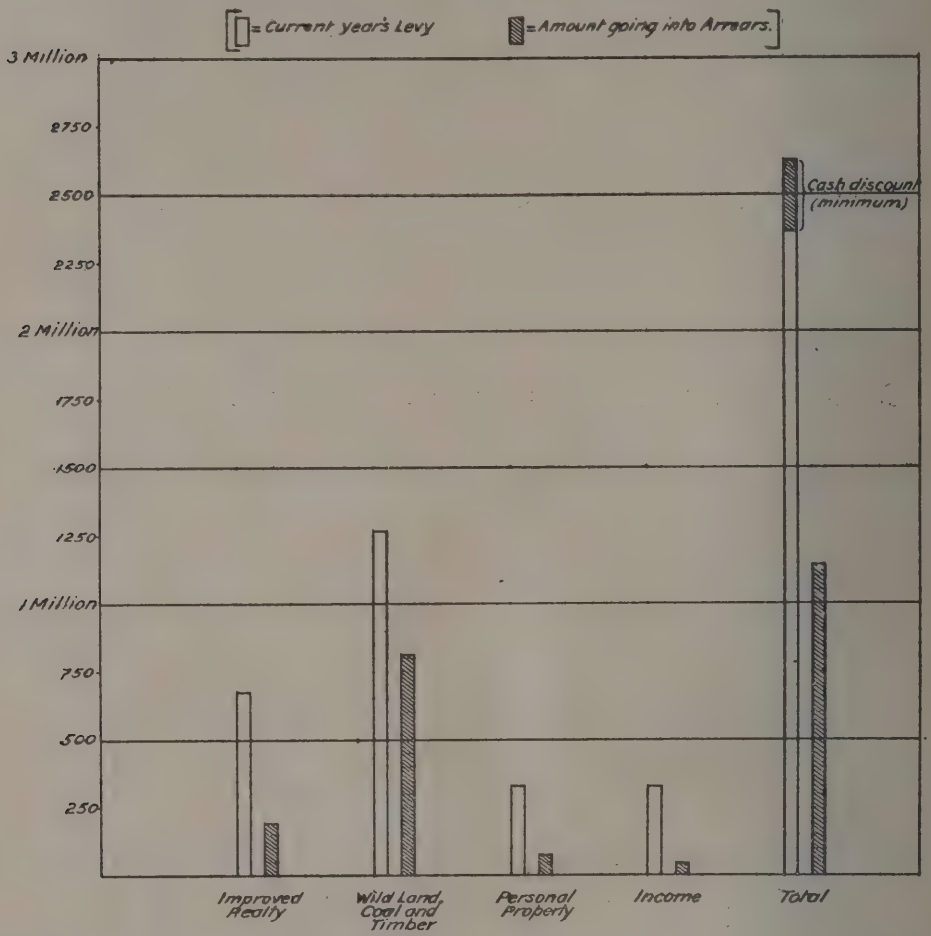
	Tax Levy.	Total Receipts.*
1909	$1,083,276 06	$ 939,326 01
1910	1,301,385 43	1,040,480 75
1911	1,450,830 08	1,224,349 99
1912	1,996,844 33	1,483,750 92
1913	2,372,414 26	1,720,795 62
1914	2,829,686 40	1,850,725 80
1915	2,556,017 65	1,635,097 21
1916	2,643,204 13	1,641,646 69

Reasons for Collection Difficulties.—The reasons for this unfavourable showing are several. First of all, the general economic conditions are such as to make tax-paying more difficult for the citizen than it was a few years ago. The large profits of the highly speculative period which ended in 1914 are now lacking to a very considerable extent. Again, many of the taxes are considered in the light of a fee being paid to the Province for the privilege of speculating upon variations in the price of land, and in a large number of cases the game is no longer worth the candle. But in addition to these reasons there is one which is probably more important than either—i.e., the failure on the part of the Government to apply any measures of compulsion

* For fiscal year ending March 31st of the following year.

Graph X.—Portion of 1916 Tax Levy going into Arrears, January 1st, 1917.



upon the taxpayers. In spite of the fact that, under the law, tax sales should be regularly held, there has been no sale of property to enforce the collection of Provincial taxes since the year 1913. Largely as a consequence of this attitude the people of the Province have come to regard tax obligations as among the least pressing rather than as the most pressing obligations of all.

Necessity of a Stricter Arrears Policy.—When a Province is able to collect scarcely one-half of its tax levy within the legal period the time has come to adopt stringent measures. It is strongly recommended that the Government take a firm stand in favour of regular tax sales. Without the stimulus applied in this manner the present very serious situation will probably grow progressively worse.

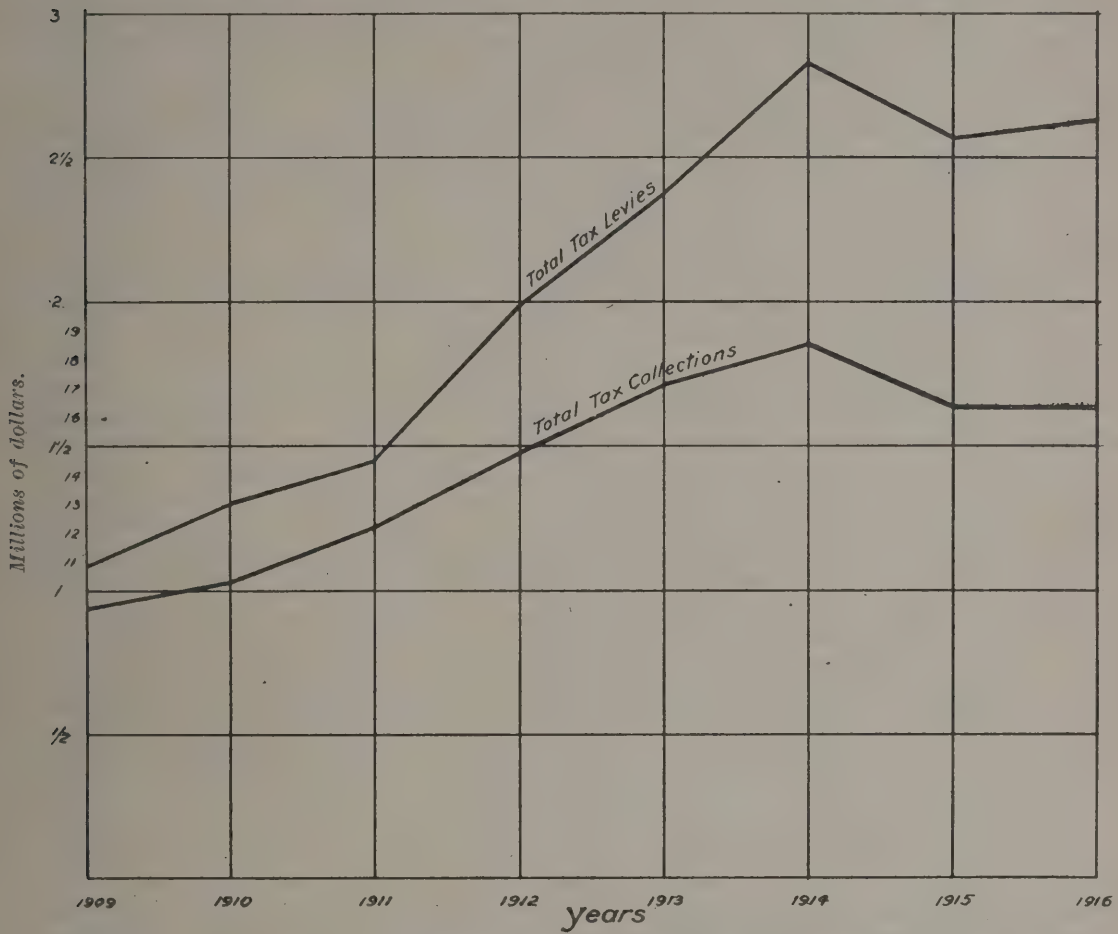
The adoption of a more stringent arrears policy may involve the necessity of making special concessions to certain classes in the community who are handicapped because of the war, particularly soldiers and their dependents.

Realizing on Arrears.—Too great expectations cannot be based upon the returns to be realized as the result of the adoption of a stricter arrears policy. The entire three and two-thirds millions of unpaid taxes cannot be collected by the mere decision to hold tax sales. In fact, a very considerable portion of this sum, amounting, as nearly as can be estimated, to about $1,500,000,* is placed in a very peculiar position through the passage of the "Soldiers' Homestead Act." Anything which is realized upon this sum will appear as receipts of the Lands Depart-

* On September 30th, 1916, the arrears of taxes on wild lands, held on the basis of certificates of purchase, amounted to $1,410,223.10.

Graph XI.—Comparison of Levies with Collections for Fiscal Years, 1909-16.

(Taxes on Improved Realty, Wild, Coal and Timber Lands, Personal Property, and Income.)



ment rather than as taxes. Nevertheless, it is only reasonable to anticipate the realization of a very considerable sum if a stand is taken which will show that the Government expects to hold taxpayers strictly accountable for their obligations.

Payment of Taxes as a Condition to passing Title.—As a measure to assist in the collection of taxes it would be wise to impose a requirement, similar to one already in force in the municipalities, to the effect that all taxes must be paid upon a parcel of realty before title can be passed.

The Discount for Prompt Payment.—A discount of 10 per cent. is allowed upon taxes on real and personal property, income, and on wild, coal, and timber land* in order to encourage the prompt payment of taxes. The plan appears to be measurably successful in attaining this object, for the bulk of the taxes are paid before June 30th. The question remains, however, as to whether the discount is an economical device. It has been in force so long that data are not available showing the effect upon promptness brought about by its imposition. Its justification must rest upon the result of comparing its cost with the cost of the alternative plans of borrowing temporarily to meet current expenditures, if that should be necessary.† The Government really pays 10 per cent. for the use of the money for six months, assuming that the money would be paid, anyway, at the end of the year. It could probably borrow at the rate of 5 per cent. per

* No discount is allowed on the mineral-tax, which is payable quarterly.

† As a matter of fact, it would undoubtedly be necessary under normal conditions, for the heavy expenditures from the Treasury are made in the summer months.

annum to meet expenses during those six months. It is estimated that the total discounts allowed annually amount to approximately $150,000.

The granting of so substantial a discount, moreover, has an undesirable effect upon the taxpayer, in that it has a tendency to make him regard his tax charge as an unfairly large sum which he can expect to be reduced before payment.

Perhaps the strongest justification which can be urged in favour of the discount plan is not valid in this case, for the discount cannot here be considered a bonus for the advance payment of taxes. The taxes are due on January 2nd of each year, and the discount is very frankly not a recompense, but a bait.

It would appear to be a policy worthy of a trial, at least, to make taxes due April 1st rather than January 2nd, and receivable at par before the end of June, abolishing the discount, at which date they would pass into arrears and be subject to a substantial penalty.

The advantages of this plan would be: (1) It would make it possible to include on the tax notice sent to the property-owner an accurate statement of actual arrears outstanding against him on January 1st; (2) it would cause the receipts for the current year's taxes to come into the Treasury after the opening of the fiscal year, thus eliminating much of the present confusion; (3) it would tend to give a greater degree of definiteness to the tax notice, which would then be a demand to pay the full amount within three months upon pain of a penalty, in place of a notice which can be ignored without penalty for more than a year, or which can be discounted below the amount charged on its face by payment within a period of more than six months; and (4) if the plan were successful in securing the payment of as much of the tax levy before June 30th as is now the case, there would be a clear saving to the Province of the discount of 10 per cent., which amounts to a very substantial sum.

The Tax-collection Period.—The period during which the taxes are payable (twelve months) is unnecessarily long. Notices sent out before the first of the year in many cases become lost before June 30th, the date when the discount privilege of 10 per cent. expires, giving rise to many requests for duplicate bills.

Moreover, on the notices sent out before January 1st the taxes of the current year remaining unpaid at the date the notice is mailed are listed as in arrears, even though they are not in arrears until December 31st. This can scarcely have other than an unfortunate effect, for it amounts to a notice that the taxes which a person was asked to pay a full year previously may still be paid before December 31st without penalty, and a reminder that the new taxes may be allowed to drift more than a year without involving him in any embarrassment.

Penalties.—The present penalties provided in the case of unpaid taxes, if, indeed, the interest charge of 6 per cent. per annum can be construed as a penalty at all, are grotesquely inadequate to the task of forcing the payment of taxes. Indeed, the existing arrangement may be said rather to encourage the non-payment of taxes after once the discount period has elapsed, for 6 per cent. is lower than the rate of interest the property-owner would be compelled to pay were he to borrow money to meet his taxes. It is really economically wise to permit the Government to finance him.

The penalty should be made at least 10 per cent. if it is to be expected to provide any compelling force in the direction of tax payments. In fact, a rate of 1 per cent. per month would, under the circumstances, probably not be too high a rate.

Minimum Taxes.—The subdivision into small parcels of lands which have a very low value and the distribution of the parcels among various owners have raised a serious administrative problem in the expense attached to the taxation of the lots. The cost of the labour of assessing, of making records, of sending notices, etc., in the case of many parcels is more than the amount of the tax involved. Most often is this true in the case of school lands where no fixed minimum is imposed. In the case of Provincial taxes there is a low minimum, the amount of the tax, if less than 25 cents, being increased to that amount. It is asserted, however, that 25 cents is not a sufficiently high charge. Certainly there is no justification for the continuance of a tax which yields less than it costs to administer. Such a tax is a ridiculous failure. Far better to leave the money in the hands of the property-owner than to burn it up as fuel for the administrative machine which accomplishes nothing more than to take the money from him.

The situation would be measurably relieved by making the tax base for school purposes identical with certain elements of the tax base used for Provincial purposes—e.g., improved land

only or all land (improved, wild, coal, and timber).* This would reduce considerably the present administrative expense. In addition, the minimum should be made sufficiently high to cover this expense, $1 being suggested by the administrative officials as a proper amount.

Reports of Collections.—To make possible a more intelligent control of the financial situation, the records should be so changed as to permit the preparation of frequent statements for the Minister of Finance, (1) comparing collections with specific levies, and (2) comparing arrears for significant periods. The books of the Province are now so kept that only the cash collections are recorded. Whatever the advantages of this policy may be from other points of view, it certainly does not give the administrator a perfect picture of the degree of success attained in collecting taxes. The only information available from the Public Accounts is the statement of the cash receipts from the various taxes. The figure given is a resultant obtained by including the receipts from the current year's levy (discounts having been allowed in some cases and not allowed in others), the receipts from previous years' levies which have been carried into arrears, and the receipts from the succeeding year's levy to the extent that they are paid during the first two months of the year. This figure may be compared with the same figure for the preceding year, but, with variations in assessments and rates, conclusions from such comparisons are almost worthless.

It would be possible, however, at a trifling addition of bother and expense, to furnish a monthly statement of the exact status of collections. The tax rolls now are summarized in such a fashion as to show the total taxes supposed to be collected by each Collector. These amounts could be definitely debited to each Collector and the moneys collected by him definitely credited to him. The form of the Collector's return would necessarily be made somewhat different in order to show more precisely the year's levy to which the amount collected belongs and the discounts allowed. By tabulating these returns and comparing them with levies an exact and dependable report could be quickly prepared.†

CONCLUSIONS.

The most important of the suggestions and conclusions scattered through the text may be summarized as follows:—

THE PRESENT FINANCIAL DIFFICULTIES ARE NOT DUE TO A SUDDEN BREAK-DOWN IN THE TAX SYSTEM.

The stringency now being experienced is due primarily to the forces which have weakened the demand for real estate. The yield of the tax system has declined somewhat, but this is because of the disappearance of the receipts under the "Chinese Restriction Act." The slump in the receipts from land-sales and from fees dependent upon such sales is the fundamental cause of the present embarrassment.

IT IS UNWISE TO EXPAND TAXATION TO MAKE GOOD THE ENTIRE DIFFERENCES BETWEEN THE RECEIPTS OF THE MOST PROSPEROUS YEARS AND THE YEARS OF DEPRESSION.

If the scale of expenditure is maintained on the level of the total receipts of the most prosperous years and taxation depended upon to supply the deficiencies caused by the slump in other sources of revenue, the result will be a strain upon the tax system probably too great to be borne. In the present instance, for example, this policy would involve trebling the tax rates at a time when the taxpayers are least able to assume new burdens. It is essential that a rational control be exercised over expenditure in periods of prosperity which will make unnecessary excessive taxation in times of depression. The adoption of such a policy would prevent the periodical recurrence of the present difficulty.

THE EXISTING TAX SYSTEM IS UNEQUAL TO THE DEMANDS OF THE PRESENT SITUATION.

It is unreasonable to expect the tax system in its present form to provide the funds which are necessary by the simple device of increasing rates. The crudeness of the taxes, which passes unnoticed when burdens are small, involves intolerable injustices when the burdens become large. Administrative shortcomings which are insignificant when rates are low become fatal when rates are increased to the levels which obtain as the result of the readjustment of 1917.

---

* *Cf. supra,* page 117.

† It would be noted that this does not involve a change in the general system of accounts or the introduction of the item of "unpaid taxes" as an asset on the Provincial balance-sheet.

THE TAX SYSTEM SHOULD BE THOROUGHLY REORGANIZED BOTH IN RELATION TO KINDS OF TAXES IMPOSED AND IN RELATION TO ADMINISTRATION.

Both equity and financial considerations demand thoroughgoing tax reform in the Province. The taxes now in existence constitute a complicated medley which can scarcely be dignified by the term "system." Certain taxes should be entirely eliminated and the others should be recast and merged into a coherent revenue system.

The administrative machinery, which has stood unaltered for fifteen years, should be modernized and made efficient.

THE RATES ON WILD LANDS MUST BE MODIFIED IF THIS TAX IS TO BE PRESERVED AS A SOURCE OF REVENUE.

The tax on wild lands, the most important fiscally of the taxes on real estate, appears to be on the verge of collapse, the statistics of arrears revealing a most serious situation. If the Province desires to use this tax as a source of revenue and does not desire to confiscate the lands, the rates must apparently be lowered considerably.

A THOROUGH INVESTIGATION SHOULD BE MADE WITH A VIEW TO READJUSTING THE TAX BURDEN ON AGRICULTURE AND ON MINING, TIMBER, AND CANNING INDUSTRIES.

Data should be secured which would make it possible to draw sound conclusions regarding the relative burdens now being imposed upon the various industries. The variety and nature of the various charges preclude comparisons, and without an investigation no scientific reorganization is possible. There is ample evidence that such a reorganization is needed.

THE POLL-TAX, AMUSEMENT-TAX, AND THE PERSONAL-PROPERTY TAX SHOULD BE SLATED FOR REPEAL AT THE EARLIEST PRACTICABLE MOMENT.

These are the least justifiable of the taxes now in force and their elimination would not involve great financial loss. So soon as it becomes apparent that the yield from these sources can be dispensed with, these taxes should be repealed.

THE INCOME-TAX SHOULD BE REFORMED BY REDEFINING THE DEFINITION OF INCOME AND REARRANGING THE SCALE OF RATES.

The present income-tax law should be radically amended by redefining income in accordance with the detailed suggestions detailed in the body of the report, and by modifying the rates so as to make them more uniform and, if financially possible, more moderate.

THE VARIOUS CHARGES ON MOTOR-VEHICLES SHOULD BE CONSOLIDATED.

At present the variety and number of separate taxes levied on motor-vehicles involve needless expense to the administrator and needless inconvenience to the owner.

BANKS, RAILWAYS, AND SERVICE CORPORATIONS SHOULD BE TAXED IN A MANNER WHICH MEASURES MORE ACCURATELY RELATIVE TAX-PAYING ABILITY.

The present levies on these types of property are so undiscriminating as to involve substantial injustices as between different units.

A PERMANENT TAX BOARD WITH WIDE POWERS SHOULD BE PLACED AT THE HEAD OF THE TAX SYSTEM.

The proper administration of the revenue system demands a more elaborate organization than has been used heretofore. It is recommended that a permanent Board of power, dignity, and responsibility be created to assume direction of the tax machinery. This Board as its first duty should reorganize the assessment districts and build up an efficient force of Assessors.

A STRICT POLICY WITH RESPECT TO COLLECTIONS SHOULD BE ADOPTED.

The present lenient arrears policy has demoralized collections. Until a firm and businesslike stand is taken on this question, a satisfactory solution of the financial problem of the Province cannot be hoped for.

APPENDICES.

APPENDIX A.

THE CLASSIFICATION OF REVENUES.

The receipts of the Province are presented in the Public Accounts in three tables. The first is a "Comparative Statement of the Receipts and Expenditures," which presents in parallel columns the data for a period of years. The second table is an itemized statement of the large amount entered in the general table under the head of "Miscellaneous Receipts." The third table, "Revenue for the Fiscal Year," gives the current year's collections by districts. The figures in all cases represent cash receipts.

Even though the general accounting procedure of the Province is not so changed as to bring to account total levies instead of merely cash receipts, the form of the tables dealing with revenues could be changed to good advantage. As now presented the data are often unintelligible.* There is need for more detail in some directions and for less in others. The titles of some of the receipts are almost entirely "blind," carrying no meaning at all except to the initiated few. Finally, no attempt is made at classification. Receipts of all types—taxes, fees, rents, sales, subsidies—important and trivial in amount, are thrown together in a heterogeneous jumble. The use of the data for drawing conclusions of any sort must consequently be preceded by an interpretation, an analysis, and a classification which involve time and labour. There is no good reason why some scheme of classification should not be adopted which would make it possible to grasp the significance of the figures without involving a prohibitive amount of effort.

The particular classification which should be adopted depends upon the points it is most desirable to make clear. Thus the classification might be designed to show the portion of the revenues contributed by individuals as compared with various specified business interests; or it might show relative burdens of the organized and unorganized areas of the Province; or the revenues which are fixed as compared with those which are relatively flexible; or the revenues which are stable and dependable as compared with those which are variable and unreliable, etc.

The classification adopted for the purposes of this study and which is utilized in the construction of Table I.† has several points to commend it. In the first place, it recognizes the established categories of public finance, grouping the receipts according to their nature, as subsidies, income from the public domain, fees, and taxes. Second, it brings out clearly the significance of the public domain in the finances of the Province. Third, it assists the user of the table by labelling according to their nature the many indefinite and unclear items. Finally, it can be adopted with but minor changes in the present Provincial records and without destroying the comparability of the statistics for previous years. The classification is presented as a tentative one in the belief that some modification of it will prove satisfactory under the conditions obtaining in British Columbia.

The principles of the suggested classification are apparent for the most part from an inspection of the table. The second item includes the receipts from the sale or lease of public property or from royalties upon certain articles in which the public interest is held to be particularly strong—e.g., the forests, the mineral deposits, and the fisheries. The fees are payments for special services performed by the State and are distinguished from taxes by the fact that in general they approximate the cost of service rendered and are not imposed primarily to secure net revenue.

Naturally there are cases where there exists some doubt about the group to which the receipt belongs. Thus it is difficult to decide whether the receipts under the "Motor-traffic Regulation Act" are more truly fees than taxes, and whether registry fees are not more properly taxes rather than fees.

* The investigator found that the statements could not be completely interpreted by a number of persons who were concerned with the actual administration of the financial system.

† *Cf. supra*, pages 82-3.

To make an accurate classification of receipts under the plan outlined it is necessary that the canneries and whaling tax be segregated from the personal-property item. Moreover, it is desirable, though not imperative, that a separate statement be made of the receipts from: (1) The tax on railways; (2) the tax on banks; (3) the tax on the gross income of certain companies; (4) the tax on improved real estate; (5) the tax on coal lands, Class A; (6) the tax on coal lands, Class B; (7) the tax on timber lands; (8) the tax on wild lands; (9) timber licences; and (10) timber leases.* To conform with usual practice the "revenue-tax" should be rechristened the "poll-tax."

Within the classes the receipts should be arranged alphabetically. The large miscellaneous item, which appears to consist principally of fees, might be distributed among the classes.

APPENDIX B.

INCOME-TAX RATES.

The combined tax burden under the new Federal income-tax law and the increased Provincial income-tax rates is worked out in detail in Table A and illustrated by Graph A. The table shows the amounts of each tax payable by persons receiving various typical incomes and the true combined rate on the total income.† The graph reveals marked irregularities in the present progression which are particularly serious in the case of the lower incomes as shown in the graph inserted in the lower corner. The data include no incomes above $150,000. The rates on the higher incomes increase gradually and regularly until they approximate in the case of individuals 39 per cent.

To reduce the irregularity shown by this curve and still to maintain the present productivity of the tax, this report recommends certain changes in the rates.‡ It also recommends alterations in the initial exemptions.§ Table B and Graph B show the effects of these proposed changes upon the lower incomes. A progression considerably more even and regular is effected in all cases. The small corporations, because of the elimination of the initial exemption, would be subject to a perceptibly higher rate. Single men pay slightly more than before and married men with dependents slightly less.

Graph C compares the rates for single men with incomes ranging up to $150,000 under the recommended rates and exemptions. Table C supplies the underlying data for the graph. The change in rates, it is apparent, eliminates much of the irregularity now present in the taxation of incomes ranging from $10,000 to $25,000.

---

* These receipts are now included in other items. Somewhere, if not in the general statement of receipts, there should be summarized a statement of the income-tax by classes of income affected.

† Including initial exemptions. The assumption is made that the definition of taxable income in the two laws is identical.

The recommendations of the Royal Commission on Taxation of 1911 in regard to changes in the income-tax rates are given above. The amounts which would be payable by single persons receiving various incomes are shown in Table D, where they are also combined with the amounts payable under the Federal income-tax law and the total rates on the entire income is calculated. Graph D contrasts these rates with the rates now obtaining. The adoption of the rates recommended by the Commission would result in a fairly regular and even progression, but the rates on the whole are substantially lower than the present scale. The adoption of the recommendation of the Vancouver Board of Trade, that the surtax not apply to corporate incomes, would reduce the productivity of the tax still more.

Table D.—Taxes payable and Tax Rates under the Dominion and Provincial Income-taxes applying to Single Men in Case the Recommendations of the Royal Commission on Taxation are adopted.

PROVINCE OF BRITISH COLUMBIA

ANNUAL REPORT

OF

THE DEPARTMENT OF RAILWAYS

FOR THE

YEAR ENDING DECEMBER 31ST

1918

PRINTED BY
AUTHORITY OF THE LEGISLATIVE ASSEMBLY.

VICTORIA, B.C.:
Printed by WILLIAM H. CULLIN, Printer to the King's Most Excellent Majesty,
1919.

To His Honour Sir Frank Stillman Barnard, K.C.M.G.,
Lieutenant-Governor of the Province of British Columbia.

May it please Your Honour:

Herewith I beg respectfully to submit Report for the Department of Railways for the year 1918.

JOHN OLIVER,
Minister of Railways.

Victoria, B.C., February 14th, 1919.

REPORT OF DEPARTMENT OF RAILWAYS.

Hon. John Oliver,
Minister of Railways, Victoria, B.C.

Victoria, B.C., December 31st, 1918.

Sir,—I have the honour to submit a report dealing with the principal activities of the Railway Department during the year ending December 31st, 1918.

The staff of the Department consists of Chief Engineer, Assistant Engineer, Inspector of Rolling-stock and Equipment, clerk, and stenographer.

In addition to railways proper, the Department has control over the Songhees terminal improvement-works and the maintenance and operation of the combined railway and highway bridge over the Fraser River at New Westminster, with its railway and highway approaches and connections.

An examination of the whole Grand Trunk Pacific line between Yellowhead Pass and Prince Rupert was made in connection with that company's application for right-of-way through Crown lands lying between these points, and all matters in that connection adjusted, except on the section between Miles 30 and 36, west of Yellowhead Pass, where the position with respect to the rights-of-way of the Canadian Northern Railway and the Grand Trunk Pacific is not yet clarified. Right-of-way applications on behalf of other companies, such as the Canadian Northern, V.V. & E., Kettle Valley, and others, have also been dealt with.

Applications for extension of time in which to complete their undertakings made by various railway companies have been dealt with, and certificates of approval have been issued for level, over, and under crossings. Location plans and profiles of various lines of railway and drawings of standard structures were placed before the Minister after examination and received his approval. A list of certificates issued during the year is given in Appendix A.

Canadian Northern Pacific Railway Terminals.

Construction of the terminals of this company has been prosecuted throughout the year, and estimates have been approved for payment in accordance with the provisions of section 7 of the "Canadian Northern Pacific Railway Terminals Act, 1913," as detailed hereunder:—

Estimate No.	41. January	$103,535 24
„	41A. January	28,013 42
„	42. February	58,403 43
„	43. March	47,661 90
„	44. April	95,645 08
„	45. May	43,183 90
„	46. June	24,005 34
„	47. July	54,313 34
„	48. August	62,916 25
„	49. September	23,092 10
„	50. October	24,785 73
„	51. November	16,196 98
„	52. December	21,705 62
	Total	$603,458 33

The position as to the terminals as at December 31st, 1918, is shown by the following statement:—

	Estimated Total Cost of each Terminal.	Proportion of Estimated Cost.	Total Cash Available each Terminal.	Proportion of Total Work now Done.	Amount now earned.	Retentions.	Amount payable.
Vancouver	$4,308,455 10	0.4713	$4,262,363 21	0.70449	$3,002,792 11	$ 3,998 69	$2,998,793 42
New Westminster	2,202,601 50	0.24095	2,179,113 97	0.83633	1,822,458 41	83,507 69	1,738,950 72
Port Mann	1,213,424 62	0.13275	1,200,570 16	0.96341	1,156,641 14	.....	1,156,641 14
Steveston	353,988 89	0.0387	349,996 73	0.8197	286,892 54	.....	286,892 54
Patricia Bay	209,908 29	0.0230	208,008 39	0.9846	204,804 68	.....	204,804 68
Victoria	853,125 00	0.0933	843,790 66	.....	.....	.....	.....
Totals	$9,141,503 40	100,000	$9,043,843 12	.....	$6,473,588 88	$87,506 38	$6,386,082 50

CANADIAN NORTHERN PACIFIC RAILWAY ON VANCOUVER ISLAND.

Track-laying started at the end of October, using rails lent by Pacific Great Eastern Railway Company to Dominion Government, and this work is still proceeding. The tonnage of 60-lb. steel rails turned over to the Canadian Northern Railway at December 31st was as follows: 2,737.8 tons and corresponding amount of accessories.

I may mention that the importance of the Nitinat country as a source of aeroplane-spruce supply was brought first to the attention of the Air Board by the Department in September, 1917. It was the importance of this spruce-supply which brought about the starting-up of this construction-work.

NEW WESTMINSTER BRIDGE.

In addition to the usual maintenance and repair-work carried out during the year to maintain the bridge and its approaches in a high state of efficiency, new 80-lb. steel rails were laid on the tracks leading from the north end of the bridge to the Great Northern line, replacing the old 70-lb. steel rails, which were disposed of by public sale.

An extension of the interlocking system as affecting Great Northern operation was completed at a joint expenditure between that company and the Government, thus assuring a better protection in the handling of railroad traffic across the bridge. This extension makes a positive block between Signal No. 18 on the south end of the bridge and Signal No. 7 in the Great Northern Sapperton plant, a distance of 5,375 feet, and permits only one Great Northern or Canadian Northern train to get within the above-mentioned interlocking section, thereby doing away with the possibility of a head-on or rear collision in the positive-blocked section.

An unsatisfactory condition still, however, exists on the east approach, south end. A Great Northern freight-train may cross the bridge and use the Government approach to get to their old water-front line on the south side of the river for the purpose of picking up or spotting cars at the shingle-mills along this line. This train would be unprotected from the time it passed the home signal on the east approach until it was able to clear the Government track at the switch connecting same with water-front line. The distance between these points is 3,800 feet, and while this unprotected train was in this section it would be possible for a Canadian Northern train to meet it on single track. Negotiations are under way with the Canadian Northern officials to remedy this condition.

A system of soundings was taken around the piers and pier-protection work of the bridge to determine the extent of scour since the previous soundings were taken in 1916. Nothing serious in the way of scour was determined.

No check was taken of the maximum vehicular traffic across the bridge during the year.

The railroad traffic across the bridge for the year 1918 was as follows:—

	Passenger.		Freight.		Mixed.	
	Trains.	Cars.	Trains.	Cars.	Trains.	Cars.
Great Northern Railway	2,261	14,424	860	18,548	1,163	8,535
Canadian Northern Pacific	1,046	5,785	1,178	17,477	1,481	3,039
B.C. Electric Railway	3,051	6,398	1,282	12,140	1,272	3,314*
Canadian Pacific Railway	.....	.....	.....	2,343	.....	.....
Chicago, Milwaukee, & St. Paul	.....	.....	.....	198	.....	.....
Northern Pacific Railway	442	2,452	361	3,968	.....	.....
Totals	6,800	29,059	3,681	54,674	3,916	14,888

* Dairy cars.

SONGHEES TERMINALS.

The work of grading the terminal grounds and industrial sites was carried on during the year up to July 15th, when it was considered advisable to suspend operations until a definite ultimate scheme of development as to terminal facilities was decided on. Sixteen thousand cubic yards of rock-excavation was carried out during the period of work at a cost of $22,000, using the same plant and equipment as in 1917.

A portion of the unimproved area at the west end adjoining Mud Bay and fronting on the harbour, amounting to 3.16 acres, was leased to the Cholberg Ship Company at a rental of $100 per month. This lease expires on February 1st, 1920, and is renewable at the option of the Minister of Railways.

Pacific Great Eastern Railway—Operation.

Operation on this line had been abandoned by the previous management. The line was blocked by snow, ice, and rock slides, and there was not a complete operating, maintenance, or mechanical organization on the road when the Railway Department started on March 13th to get the motive power in shape, so as to open the 167 miles of line between Squamish and Clinton; yet in about three weeks this line was ploughed out, an extra gang, section crew, steam-shovel crew, bridge-repair gang, roundhouse-men, and car-repair men were organized and put to work, and a regular schedule service inaugurated. The main line, Squamish to Clinton, and the North Shore Division, North Vancouver to Whytecliff, were then carefully inspected, and necessary work outside regular maintenance of track and bridge-repair work was undertaken and carried out in the summer months. Ballast was hauled and distributed on sections which had never been raised to final surface, and the line put in good running condition.

The wharf and wharf approach at Squamish was given a thorough overhaul and some needed repairs made at the North Vancouver transfer ferry-slip.

In order to maintain a regular service on the North Shore Division it was decided to replace the pile bridge across the Capilano, which was washed out, by another temporary structure, so as to afford transportation facilities while the two new bridges, 100-foot span each, were being erected. It was estimated that the whole of this work (temporary and permanent bridges) would cost from $48,000 to $50,000. This work was done by contract and has now been completed at the estimated cost.

A new cattle-corral and loading facilities were provided at the Cariboo Road crossing, some thirteen miles north of Clinton, which proved of very great value to the stockmen in the country and benefited the railway company, and thirty additional stock-cars were brought so as to ensure rapid movement of stock shipments.

As the railway company's agreement with the Canadian Pacific Railway Company covering lease of barge handling the traffic between Squamish and Vancouver expired on June 30th, and that any renewal thereafter would have to be on the basis of $50 per day rental instead of the old rate of $40 per day, it was decided to buy or build a barge. Tenders were called for construction of a fifteen-car barge, but no bids were received; consequently most of the barges on the Pacific Coast between San Francisco and Victoria were inquired into with the idea of purchase, and eventually it was found possible to purchase from the Great Northern Railway their transfer barge for $18,000, which had been carefully examined by competent authority and reported on favourably.

On August 7th the tug "Freno," rented by the railway company at $100 per day, was partially destroyed by fire, and immediate steps were taken to purchase a tug for the railway company. After careful survey of and report on the tug "Daring," of Seattle, this vessel was bought for the sum of $24,000. This tug and barge handle the Vancouver to Squamish and Vancouver to North Vancouver transfer business.

The question of light, water, and power needed at Squamish terminals and town has been gone into thoroughly; surveys, plans, and estimates made; and it is intended to commence the construction of a combined light, water, and power system there, giving power for the use of the railway-shops and light and water for the use and protection of the railway company's property and for the town.

On account of the insufficient housing accommodation for railway employees at Squamish, it was considered necessary, as a beginning, to erect twelve employees' cottages with modern conveniences. Tenders were called for. The contract was awarded to the lowest tenderer, and there are now eight of the twelve under construction.

A reconnaissance was made early in the year covering three possible routes connecting the Pacific Great Eastern near Clinton with the Canadian Northern Railway at Ashcroft, and an extremely favourable line, both as to grades and curvature, has been found, and at a cost not exceeding $42,000 per mile ready for operation.

Surveys for the replacing of several pumping-stations by gravity system at water-supply stations on the line have been made, estimates made, and the work is ready to be undertaken when the time is opportune.

PACIFIC GREAT EASTERN RAILWAY—CONSTRUCTION.

At the end of July it was decided to undertake further construction-work. Tenders were called for, and on August 24th a contract was entered into with the Northern Construction Company to carry out the works on a cost plus basis and working to certain definite unit prices. If the unit prices are exceeded, no percentage will be paid on the excess; but if the work is done at a less price than the quantities multiplied by the unit price, then the contracting firm will receive in addition to the 5½ per cent. on the actual cost of the work a bonus of 25 per cent. of the saving effected, the remaining 75 per cent. accruing to the railway company.

In connection with this method of doing work, the following extract from the *Engineering News-Record*, New York, of date January 2nd, 1919, comments as follows:—

"The cost-plus-sliding-scale-fee contract has operated successfully, and should not be permitted to disappear from public-works practice. It may well be that the details of this contract can profitably be altered, but its principle of assured fair compensation should be maintained inviolate. Government officials who have directed war construction, contractors who have performed this construction, and engineers who have watched the war-work are a unit in this opinion. They are supported by the record of a thousand million dollars' worth of work accomplished with remarkable speed and with astonishing harmony between engineers and contractors and workmen."

A start was not made till well on in September, but on December 31st there had been constructed the following:—

32 miles track-laying.
12 miles surfacing and ballasting.
43 miles telephone-line.
300,000 feet timber erected in bridges.
3 portable stations.
1 40,000-gallon water-tank and pumping-station.
3 tool houses.
800 cubic yards grading.
67,000 ties.

There is now being delivered from the Illinois Steel Company the balance of the rails and fastenings required to finish the track-laying on the Pacific Great Eastern Railway to Fort George. About 11,500 tons of rails and accessories have already been received, and in this connection I would draw your attention to the fact that the railway company is getting a much better rail than originally called for, owing entirely, however, to the peculiar position the rail-mills were in, due to the war; the United States Government having ordered plant changes, eliminating the production of Bessemer. The Pacific Great Eastern is receiving O.H. rails instead of Bessemer, and that O.H. is very much in favour with railroad companies the production in 1915 of 1,755,168 tons O.H. against 326,952 B. clearly shows.

Examinations, amongst others, of the following lines of railway and of their power and equipment have also been made during the year:—

British Columbia Electric lines.
Nakusp & Slocan.
Western Fuel Company.
Canadian Colliery lines.
Morrissey, Fernie & Michel.
Eastern British Columbia.
Corbin Coal & Coke Railway.
Dolly Varden Mines Railway.

A list of the Minister's certificates issued in accordance with the provisions of the Act and referring to all such matters connected with railways as provided for therein is given in Appendix A.

Accidents which have occurred on railways under the jurisdiction of this Department and reported as required by the Act are stated in Appendix B.

A list of the railways incorporated under Acts of the Legislature of British Columbia since 1883 is given in Appendix C.

A list of the companies operating logging and industrial railways, with their mileages, etc., is given in Appendix D.

Balance-sheets, in accordance with the provisions of the "Railway Act," have been filed by the following railway companies:—

Comox Logging Railway Company.
Crow's Nest Southern Railway Company.
British Columbia & Yukon Railway Company.
Victoria Terminal Railway & Ferry Company.
Victoria & Sidney Railway Company.
Menzies Bay Railway Company.
New Westminster Southern Railway.
Penticton Railway Company.
Pacific Great Eastern Railway.

I have the honour to be,
Sir,
Your obedient servant,
A. F. PROCTOR,
Chief Engineer.

APPENDICES.

To His Honour Sir FRANK STILLMAN BARNARD, K.C.M.G.,

Lieutenant-Governor of the Province of British Columbia.

MAY IT PLEASE YOUR HONOUR:

The undersigned has the honour to present the Report of Provincial Game Warden for the year ending December 31st, 1918.

J. W. DE B. FARRIS,

Attorney-General.

Attorney-General's Department,

Victoria, B.C., February 25th, 1919.

PROVINCIAL GAME WARDEN'S OFFICE,

VICTORIA, B.C., January 31st, 1919.

Honourable J. W. de B. Farris, K.C., M.P.P.,

Attorney-General, Victoria, B.C.

SIR,—I have the honour to submit herewith my Report for the year ending December 31st, 1918.

I have the honour to be,

Sir,

Your obedient servant,

WM. G. McMYNN,

Provincial Game Warden.

REPORT FOR THE YEAR 1918.

The year under review marks the third important step in the history of game-protection in this Province. The Game Department came into existence in 1905, and commencing with a small appropriation and a limited staff carried on a sporadic but successful effort at game-protection with the means at its disposal. In 1913 the resident firearms licence was introduced, which received a ready support from the shooting public. The number of Game Wardens was largely increased, and the revenue exceeded expectations by increasing from (approximately) $6,000 in 1912 to $107,000 in 1913. At the last session of the Legislature, in April, 1918, the "Game Act" was amended to allow of the creation of a Game Conservation Board, which met with widespread approval, it being readily recognized that a course which had been adopted with such proved beneficial results in other countries, notably in the United States, clearly demonstrated the practicability of applying to the conservation and propagation of game a wider outlook and more varied opinion than could be obtained by individual effort. Provision was also made for the administration of the Game Department being amalgamated with the duties of the Provincial Police, and the Superintendent of Provincial Police was created ex officio the Provincial Game Warden.

So radical a change in the affairs of a Department in which the general public so largely share was bound to meet with a certain amount of adverse criticism, and considerable skepticism was expressed as to the success which would attend the enforcement of the game laws by police officers. The changes, however, were favourably received by the sporting community as a whole, and resolutions endorsing the legislation foreshadowed were passed by some of the more important game associations. The creation of a Game Conservation Board was felt to be a forward step at a time when conservation was of paramount importance, and the opportunities afforded for the energies of a Game Board representative of the whole Province have amply demonstrated the successful nature of the change. Co-operation and a clearer understanding with the Dominion authorities was also necessary for the better working-out of the "Migratory Birds Convention Act," and the recommendations of the Game Conservation Board resulted in the establishment of zones for the open seasons for wild-fowl shooting, which practically met the requirements of the treaty. Migratory non-game birds and insectivorous birds also came in for a greater measure of protection.

Whilst much had been achieved in the protection of game and the enforcement of the law in past years, the time had arrived for a more thorough and organized effort. The Deputy Inspectors of the Provincial Police, and all officers under them, threw themselves wholeheartedly into their new duties, and a fresh impetus was given to the enforcement of the law, as evidenced by the increase of revenue and convictions. The success, however, of the enforcement of the law should not be measured entirely by the number of convictions recorded, but rather by the prevention of violations and the attitude of the shooting public. It is becoming more increasingly recognized that education is the most important factor in all matters pertaining to successful conservation. The system of licensing creates two motives in the mind of the purchaser—either the licence is bought from a sense of upholding the Department and protecting the game, or else it is bought merely as a means of avoiding prosecution. The latter motive can only be eradicated by fostering and increasing an interest in conservation, and every educational opportunity should be utilized to impress, not only on sportsmen, but on boys also, the necessity of protection, the importance of immunity from molestation to game during the breeding season, and the destruction of vermin preying upon game birds, in which the shooting public can so largely assist. The farmers, too, should be encouraged to look more leniently on the "damage to crops" (so commonly exaggerated) by insectivorous or game birds, for there is proof beyond question that bird-life is one of the most indispensable balancing forces of nature.

On the recommendation of the Game Conservation Board, regulations governing the payment of bounty were revised, and an increase in the bounty payable on cougar was suggested. Provincial constables were also furnished, in many cases, with suitable weapons and ammunition, and instructed, wherever possible, whilst in the fulfilment of their duty, to assist in the destruction of predatory animals and birds.

The amendments to the "Game Act," which are dealt with more particularly under a separate heading in this report, have opened a new era for game-protection in British Columbia. The report of the Chairman of the Game Conservation Board, dealing more particularly with the Lower Mainland and Gulf Islands and the work of this Department during the past year, contains the following:—

"Upon assuming my duties as a member of the British Columbia Game Conservation Board last May, I endeavoured to familiarize myself with the existing conditions of the game of the Lower Mainland and Gulf Islands.

"I found, upon investigation, that the Fraser Valley, the natural habitation of almost all kind of bird-life, was well stocked with almost all the various game birds that will thrive in this district, but that there was a marked laxity of public interest in the conservation of these birds, due, I believe, to the way the game regulations of the Province had been enforced, and also due to the fact that, although sporting men of the various districts had been contributing year after year to protection and conservation by their annual firearms licences, yet they had received very little, if any, of either.

"The change in the manner of protection brought into effect by the amendments to the 'Game Act' just previous was looked upon with disfavour in a great many localities, so that the prospects for arousing public interest and support were very slight.

"The sentiment regarding the game on the Gulf Islands and inlets adjacent was very much the same as found in the Fraser Valley. Violations of the game laws were common.

"I am pleased to report to you that this condition has entirely changed; there has been a very marked awakening of public interest in the protection and conservation of our bird and animal life throughout these sections, and the progress of the movement is indeed encouraging. The game associations have awakened and have taken on new life. To-day they are behind the authorities for conservation and propagation.

"The sporting men are keen in their endeavours to help the game officers in the fulfilment of their duties. This awakening bids fair to place British Columbia in its true light. Show to the world the value of the great resource we have in both big game and game birds, and make this Province what it should be—the paradise for true sportsmen.

"The reverse of opinion has been gradually brought about by reason of the attitude taken by your Department, convincing all that you intended to and would enforce the game regulations and laws of the Province.

"The officers have been untiring in their efforts to see that all orders were carried out, and to bring wanton destroyers of game to their just deserts. Another great factor has been in showing the sportsmen that something is being done for the propagation of game by the authorities, and that this will be carried on."

Energetic efforts have been made to increase the stock of pheasants, and the principal farm for raising the same has been started at the Wilkinson Road Lock-up, Victoria District, where it is hoped some 4,000 birds will be raised next spring.

The lease on the land at the Horst Farm, in the vicinity of Chilliwack, which had been formerly used for this purpose, expired at the end of the year; this location, having served its purpose, has now been abandoned, and there is no doubt that much better results will be obtained on Vancouver Island. Beyond the Horst Farm there was no provision for game sanctuaries for birds, and the Board early recommended and arranged for the creation of a game sanctuary in the vicinity of Victoria, comprising Elk and Beaver Lakes and the watershed surrounding these waters.

The retiring Provincial Game Warden and Deputy Game Wardens, whose services were automatically dispensed with at the end of last March by the passing of the amending Bill, were granted a gratuity in accordance with the length of their service, whilst those whose services were retained were merged with the staff of the Provincial Police.

AMENDMENTS TO THE "GAME ACT."

By the 1918 amendments to the "Game Act," which came into effect on April 23rd, 1918, the administration of this Department was placed in the hands of the Superintendent of Provincial Police, who became ex officio the Provincial Game Warden, and all Provincial Police officers became ex-officio Game Wardens. Provision was also made for the appointment of a Chief Game Inspector, under the direction of the Provincial Game Warden. A Game Conservation

Board was created, consisting of five members, of which the Curator of the Provincial Museum became ex officio the Secretary and the Chief Game Inspector an ex-officio member. The remaining three members were appointed by the Lieutenant-Governor in Council, and the Board as constituted stands as follows: Dr. A. R. Baker, of Vancouver, Chairman; F. Kermode, Curator of Provincial Museum, Victoria, Secretary; F. H. Mobley, M.L.A., of Atlin; F. A. Dunn, of Cranbrook; R. Gidley, Acting Chief Game Inspector, Victoria.

The Board is required to meet four times in each year, at the times and places designated by the Minister, to receive and consider suggestions for the conservation, propagation, and importation of game, and to advise the Lieutenant-Governor in Council upon all matters arising under the Act.

Other amendments to the undermentioned sections of the "Game Act" provided for:—

Section 9. Inclusion on the protected list of game animals and birds of pigeons and doves and Western and American robins and thrushes.

Section 10. A reduction in the bag limit, which is now as follows, subject always to seasons being declared open in that behalf by the Lieutenant-Governor in Council: 1 moose; 1 wapiti; 2 caribou; 2 mountain-sheep of any one species, or not more than three in all; 2 mountain-goat; 3 deer of any one species, or not more than four in all; 250 ducks.

Section 24, subsection (*a*). Altering the farmer's free licence, entitling him to shoot only on his own land.

Section 24, subsection (*e*). Alteration in the non-resident big-game licences, the fee being amended to $25, subject to a schedule of fees for game killed, namely: For grizzly bear, moose, sheep, wapiti, or caribou, $25 each; for black or brown bear, mountain-goat, or mule-deer, $15 each; for deer of any other species, $5 each.

Section 24, subsection (*h*). Amending the non-resident angler's licence, and making the same valid from March 25th to November 15th in each year, in conformance with the Dominion Fishing Regulations, and amending the fee for this licence to $1 per day up to five days, or $5 for the season.

Section 45, subsection (2). Making pit-lamping a prison offence, without the option of a fine.

REVENUE AND EXPENDITURE.

The revenue obtained this year from the sale of firearms licences shows a surplus of $15,500 over the amount estimated by the Honourable the Minister of Finance as likely to be received, and this figure is (approximately) $10,000 in excess of the receipts obtained in 1917-18. There is also an additional sum of $1,300 which has been collected but only reported to me subsequent to the date of tabulating this report, which, together with a few miscellaneous receipts and further collections from the sale of trappers' licences, will bring the total for the year to over $77,000.

By comparison with last year the figures are as follows:—

	1917.	
Resident licences—		
O.F.L., 14,020	$35,050 00	
G.F.L., 2,864	14,320 00	
S.F.L., 1,141	11,410 00	
Guides, 30	150 00	
F.F.L., 4,940	.....	
P.F.L., 2,273	.....	
		$60,930 00
Non-resident licences—		
Big game, 31	$ 3,100 00	
Bear, 10	250 00	
Anglers, 134	670 00	
Weekly bird, 3	15 00	
Season bird, 2	100 00	
		$ 4,135 00
Miscellaneous receipts		422 50
		$65,487 50

		1918 (to Dec. 31st).
Resident licences—		
O.F.L., 16,432	$41,080 00	
G.F.L., 2,970	14,850 00	
S.F.L., 1,524	15,240 00	
Guides, 27	135 00	
F.F.L., 3,200	.....	
P.F.L., 1,789	.....	
		$71,305 00
Non-resident licences—		
Big game, 51	$ 1,275 00	
Big game, fees	2,205 00	
Bear, 5	125 00	
Anglers' season, 85	425 00	
Anglers' daily, 42	42 00	
Weekly bird, 2	10 00	
Season bird, 3	150 00	
		$ 4,232 00
		$75,537 00

It will be noticed from the above comparison that the increase is chiefly derived from the ordinary $2.50 and trappers' licences.

Great economy, as compared with previous years, has been practised in the expenditure for game-protection, and the work of the police has only been charged for where expenses were incurred for purely game matters. During the open season special constables were engaged, particularly for the enforcement of the Act, and their salaries and expenses were consequently all charged to this Department. A synopsis of the expenditure to date is as follows:—

Appropriation as per Vote No. 45		$35,000 00
Expenditure from April 1st, 1918, to December 31st, 1918—		
Salaries	$9,172 44	
Expenses of Game Board	637 83	
Overhead charges	1,831 01	
Expense accounts	3,638 79	
Pheasant-raising	2,156 38	
Releasing red deer	151 54	
Sundries	70 00	
Payments account, 1917	590 88	
		18,218 87
		$16,781 13
Less bounties paid		3,152 50
Balance on hand		$13,628 63

By comparison with the year 1918-19, an immense saving has been effected in the cost of game-protection, the result being as follows:—

	Revenue.	Expenditure.
1917-18	$65,487 50	$55,033 80
1918 (Dec. 31st)	75,537 00	18,218 87
		$36,814 93

Revenue derived from Sale of Non-resident Licences from April 1st, 1918, to December 31st, 1918.

ENFORCEMENT OF THE LAW.

A noticeable increase in the number and variety of convictions for violations of the game laws is the outstanding result of the nine months' work of the Provincial Police, and there has been more widespread control of all kinds of shooting throughout the Province than could possibly have been achieved by the Game Wardens previously employed.

A comparison of statistics for the years 1917 and 1918 demonstrates at a glance these results.

Recapitulation.

	Informations laid.	Convictions.	Suspended Sentences.	Cases withdrawn.	Cases dismissed.	Guns confiscated.	Fines imposed.
1918.							
January 1st to March 31st	27	22	3	2	..	..	$ 440 00
April 1st to December 31st	167	137	5	7	13	5	2,901 00
	194	159	8	9	13	5	$3,341 00
1917.							
January 1st to December 31st	111	97	..	4	10	..	$1,763 50

In the more settled districts where good roads are to be found and in the vicinity of the large towns the ever-increasing use of the automobile is revolutionizing the methods of obtaining shooting. Districts formerly inaccessible to hunters with limited time to indulge in this sport can now be readily reached for week-end shooting by aid of the car. Unfortunately, whilst improving the opportunities for sport, this method cannot but react unfavourably upon the game birds, as opportunities for illegal shooting both in and out of season are greatly facilitated.

The use of automobiles as a means of pit-lamping is also frequent, but with the long-advocated amendment in operation, making this practice a prison offence, a determined effort has been made to put a stop to it. Three convictions, resulting in gaol sentences of thirty days each, have been obtained on Vancouver Island, and it is to be hoped these examples will act as a deterrent to others.

A stricter enforcement of the law has been put into execution in the northern part of the Province. Telegraph Creek, where for years past the Indians have done much as they pleased, was visited early in the year by the Acting Chief Game Inspector, and two convictions were obtained against persons having moose-meat in their possession out of season. An officer was subsequently stationed at this place, and a more strict watch is being kept on the exportation of big-game trophies. Other successful and important prosecutions to be noticed are three cases of persons "allowing dogs to run deer," this being one of the most difficult offences to prove; and one case of "removing traps legally set," which resulted in the conviction of an Indian (son of a chief), and for which a fine and gaol sentence was imposed. Two convictions for trapping out of season, in which heavy penalties were imposed, were obtained in the Columbia and Fort George Districts, both entailing considerable arduous work on the part of the officers making the arrests.

Just prior to and during the greater part of the open season for game birds a number of special constables were temporarily employed to assist the regular police in their work, and the most favoured shooting districts were thoroughly combed for hunters who had risked not taking out their licences.

The work of the force may be more particularly summed up in the following extracts from the Chairman of the Game Conservation Board, the Deputy Inspectors, and Chief Constables:—

Chairman of the Game Conservation Board.

"I am pleased to report to you that all the officers in this district (Lower Mainland and Islands adjacent) under your supervision have been untiring in their efforts to enforce the game laws, and have shown extreme courtesy in assisting me to gather any information I required, and have assisted always in our endeavours for the protection and conservation of game."

Acting Chief Game Inspector.

"In the districts visited by me, which included Telegraph Creek, Kamloops, Clinton, and the Lower Mainland, also Vancouver Island, I find that game conditions under the new regime are exceptionally good. I must say that the enforcement of the 'Game Act' during the year 1918 has given the greatest satisfaction to the sporting public.

"On Vancouver Island complaints of hunting deer with head-lights seems to be the chief complaint, regardless of the fact that a prison term must be imposed without the option of a fine. In my dealings with the Provincial Police I have found them always ready to give every possible assistance when requested.

"During the past hunting season a greater number of special constables than usual have been put on, with the result that the prosecutions have been more numerous than usual."

The Deputy Inspector, Vancouver.

"A considerable portion of this district lies on the Gulf of Georgia and the Islands adjoining, and with the exception of the 'Watla' launch we have no other craft available for this work. This boat, however, with the officers on board, have done good work, which well justifies keeping her in commission for this branch."

The Deputy Inspector, Kamloops.

"A game-conservation was effected in this way: that, where previously there was one man acting as Game Warden, this year there were constables all over the district, and in addition I was enabled, through having a car, to cover as much ground in a week as a man on horseback would cover in a season, and in my patrols I found, in conversation with ranchers and others, that they were more than satisfied with conditions generally."

The Deputy Inspector, Fernie.

"With the exception of a few instances, the 'Game Act' throughout the whole division has been fairly observed by the citizens themselves. Thanks are due, to a great extent, to the activity of the Rod and Gun Clubs throughout the division. The police have in every instance followed instructions and have investigated complaints without delay."

The Deputy Inspector, Fort George.

"Regular patrols are carried out from time to time, and constables have been advised that game-protection forms an integral part of their duty. Ordinary patrols are supplemented by special investigations under the 'Game Act' as occasion demands. Personnel is further augmented by four duly appointed special officers resident in remote districts, remunerated only when departmentally employed."

The Chief Constable, Golden.

"Prosecutions so far have been few, owing, in a great measure, to the scarcity of men in the country. The Kootenay, which is the most important big-game area in the district, if not in the Province, has been systematically patrolled by the Wardens, and all hunters checked up as to licence, etc. Considerable difficulty has been experienced in the Kootenay, owing to bridges having been washed out by the high water last season, making fording of streams necessary and in many cases dangerous. The British Columbia-Alberta boundary has also received attention, Constable Farey having been in that section since October until driven out by snow about November 7th. During that time he worked in conjunction with the National Park Game Wardens and patrolled south as far as Kananaskis Pass."

The Chief Constable, Clinton.

"The provisions of the 'Game Act' have been strictly enforced throughout the district. The Indians are the worst offenders and are the hardest to catch, owing to the size of the sub-districts and the length of time for information to reach the police."

PROSECUTIONS.

No. of Cases.	Description of Offence.	Fines and Penalties imposed.
	January 1st, 1918, to March 31st, 1918.	
6	Game in possession during close season	$195 00
1	Venison on premises of a restaurant	25 00
1	Exceeding bag limit on deer	50 00
1	Trapping without a licence	25 00
4	Hunting wild-fowl from power-boat in tidal waters	25 00
1	Non-resident carrying firearms without a licence	50 00
1	Carrying firearms without a licence	10 00
1	Furnishing false information	25 00
4	Pump-gun not plugged	35 00
		$440 00
1	Killing grouse during close season	2 months in gaol.
1	Game in possession during close season	1 month in gaol.
3	Carrying firearms without a licence	Suspended sentence.
2	Carrying firearms without a licence	Withdrawn.
	April 1st, 1918, to December 31st, 1918.	
4	Venison in possession during close season	$ 100 00
2	Killing deer during close season	150 00
5	Killing fawns	200 00
1	Fawn in possession	25 00
5	Allowing dogs to run deer	205 00
1	Game on premises of a shop	75 00
1	Game in cold storage	5 00
1	Killing female moose	250 00
2	Moose-meat in possession illegally	20 00
1	Killing caribou during close season	250 00
12	Caribou-meat in possession illegally	60 00
2	Killing mountain-goat during close season	50 00
1	Killing bear without a licence	50 00
3	Killing pheasants during close season	125 00
1	Pheasants in possession illegally	35 00
2	Killing grouse during close season	75 00
7	Grouse in possession illegally	130 00
1	Hunting ducks during close season	5 00
1	Ducks in possession illegally	1 00
2	Hunting wild-fowl from power-boat in tidal waters	20 00
1	European partridge in possession illegally	5 00
1	Hunting illegally with farmer's free licence	5 00
1	Non-resident carrying firearms without a licence	75 00
48	Carrying firearms without a licence	365 00
1	Hunting during close season	5 00
6	Trespassing in pursuit of game on a game reserve	75 00
7	Trespassing in pursuit of game	75 00
2	Trapping during close season	350 00
1	Boy under sixteen carrying firearms illegally	5 00
3	Pump-guns not plugged	30 00
1	Carrying firearms in auto illegally	50 00
1	Refusing to stop auto	5 00
1	Furnishing false information	5 00
2	Insectivorous birds in possession illegally	20 00
		$2,901 00
3	Firearms and head-lights in possession (pit-lamping)	30 days in gaol each.
1	Removing traps legally set. (Fine $200 and one month, or three months in all, in gaol)	3 months in gaol.
1	Killing grouse during close season	2 weeks in gaol.
1	Game in possession illegally	3 months in gaol.
1	Killing deer during close season	Suspended sentence.
1	Killing mountain-goat during close season	Suspended sentence.

PROSECUTIONS—*Concluded.*

No. of Cases.	Description of Offence.	Fines and Penalties imposed.
2	Carrying firearms without a licence	Suspended sentence.
1	Carrying firearms in auto illegally	Suspended sentence.
4	Carrying firearms without a licence	Dismissed.
2	Killing deer during close season	Dismissed.
1	Caribou-meat in premises of a shop	Dismissed.
1	Killing willow-grouse during close season	Dismissed.
1	Willow-grouse in possession illegally	Dismissed.
1	Refusing to stop auto	Dismissed.
1	Permitting licence-badge to be used	Dismissed.
1	Trespassing in pursuit of game	Dismissed.
1	Using another person's licence-badge	Dismissed.
3	Hunting without a licence	Guns confiscated.
2	Pump-guns not plugged (warrants for arrest issued)	Guns confiscated.
1	Caribou-meat in possession illegally	Withdrawn.
3	Bear-meat in possession illegally	Withdrawn.
1	Carrying firearms without accompanying badge	Withdrawn.
1	Game in possession illegally	Withdrawn.
1	Trespassing in pursuit of game	Withdrawn.

NOXIOUS ANIMALS.

Supplementary appropriations for the payment of bounty were required to dispose of the applications up to March 31st, 1918, but, as the price of coyote-pelts had greatly increased during the past few years, changes in the Bounty Regulations were introduced this year, which came into force on July 1st, 1918. Under these regulations the bounties payable are as follows:—

Each cougar .....Mature, $15 00; young, $7 50
Each timber-wolf .....Mature, 10 00; young, 5 00
Each coyote .....Mature, 2 00; young, 1 00
Each big-horned or snow owl .....

Certain restrictions were imposed with regard to the obtaining of these bounties.

In the case of wolves, the whole pelt, together with a statutory declaration, must be sent to the Curator, Provincial Museum, for verification before payment of bounty is made.

Bounty on coyotes can only be claimed on those killed in the Province west of the Rocky Mountains, and the pelts must be surrendered to the Government, together with the application for bounty, within thirty days of the date of the certificate.

Owls on which bounty is claimed must have been killed in the Electoral Districts of Comox, Alberni, Newcastle, Nanaimo, Cowichan, Esquimalt, Saanich, Islands, Richmond, North and South Vancouver, Dewdney, Delta, and Chilliwack.

The result of these regulations, as intended, was a great falling-off in the number of applications for bounty. It was obviously unreasonable for the Government to pay a bounty of $2 on coyotes when pelts of these animals were fetching anywhere from $12 to $20. At the same time, as many summer pelts are practically worthless, the opportunity was afforded for the presentation of these skins for bounty.

There have been many complaints about the increase of cougars, and it would appear to be advisable to provide a higher bounty for their destruction, with a view to encouraging people to make a more determined effort to reduce the quantity of these animals, which make havoc among domestic animals as well as game.

The Chief Constable at Fort George reports that cougar have been seen more frequently in his district than heretofore.

Dr. Gordon Hewitt, Secretary for the Dominion Advisory Board on Wild-life Protection in Canada, reported to the Game Conservation Board that the former had under consideration the effectual treatment of predatory animals, particularly in the Bridge River District. He further stated that the Advisory Board on Wild-life Protection, after going fully into the matter with the authorities of the Biological Survey of the United States Department of Agriculture,

had come to the conclusion that the bounty system will not succeed in ridding any territory of predatory animals. Certainly all evidence seems to tend to this conclusion.

Very few bounties on coyotes have been claimed, and the total amount paid for bounties since April 1st, 1918, to date represents a trifle over $3,000. This includes applications for bounties on coyotes up to July 1st, before the new regulations came into force.

The Game Conservation Board has made a recommendation, largely supported by gun clubs and private individuals, for a bounty on crows. The Chairman, writing on conditions in the Lower Mainland, says:—

"Throughout this portion of the Province crows are proving the greatest menace to our bird-life. Songbirds in this district are fast decreasing, and it is an undeniable fact that the crows' activities are increasing, and some strong efforts must be made to secure a reduction in their number."

OPEN SEASONS.

A meeting, which was widely advertised, for discussion as to the most suitable dates for the open seasons was arranged by the Game Conservation Board, and held in Victoria on July 29th, 1918. Sportsmen throughout the Province were invited to be present at this meeting or to forward to it their recommendations. A considerable number of local sportsmen attended the meeting, and resolutions were passed which were subsequently considered and largely adopted by the Board in framing their recommendations to the Executive Council, when the following open seasons were determined upon:—

Moose	Sept. 1-Dec. 15.	In Atlin, Fort George, Omineca, Cariboo, and Columbia Electoral Districts.
Caribou*	Sept. 1-Dec. 15.	Throughout the Province.
Mountain-sheep	Sept. 1-Nov. 15.	North of the main line of the G.T.P.
Mountain-goat	Sept. 1-Dec. 15.	Throughout the Province.
Bear	To June 30, '19.	Throughout the Province.
Deer†	Sept. 14-Dec. 15.	Throughout the Province.

	Northern.	Eastern.	Western.
Ducks, snipe, and plover	Aug. 15-Nov. 20	Sept. 2-Dec. 8 north of C.N.R.; Sept. 14-Dec. 15 south of C.N.R.	Sept. 21-Jan. 5 on Mainland; Nov. 2-Feb. 7 on Vancouver Island and Islands adjacent.
Geese and Brant	Aug. 15-Nov. 20	Sept. 2-Dec. 8 north of C.N.R.; Sept. 14-Dec. 15 south of C.N.R.	Sept. 21-Jan. 5 north of 51st parallel; Nov. 16-Feb. 21 south of 51st parallel.
Blue Grouse	Aug. 15-Mar. 31	Sept. 14-Oct. 31 south of C.N.R.	Sept. 14-Nov. 3.
Ruffed or willow, Franklin, and Ptarmigan grouse	Aug. 15-Mar. 31	Sept. 14-Oct. 31 south of C.N.R.	
Prairie-chicken		Sept. 14 - Sept. 21 in Grand Forks and Greenwood Electoral Districts.	
Quail		Oct. 26-Nov. 8 in Similkameen Electoral District.	Oct. 26-Nov. 26 in Esquimalt, Saanich, and Islands Electoral Districts.
Pheasants		Oct. 26-Oct. 28 in South Okanagan Electoral District; Oct. 26-Nov. 8 in Similkameen Electoral District.	Oct. 26-Nov. 26, except in Alberni and Comox Electoral Districts.
European partridges			Nov. 25-Nov. 26 in Delta and North Saanich Electoral Districts only.

Foxes	Nov. 1-Mar. 15, '19.	Throughout the Province
All other fur-bearing animals	Nov. 1-Apr. 30, '19.	North of C.P.R. and in Columbia Electoral District.
Ditto	Nov. 1-Mar. 31, '19.	South of C.P.R., including Vancouver Island and Islands adjacent.

* Except in Queen Charlotte Islands and Rainbow and Hatchie Mountains.
† Except in Queen Charlotte Islands.

The Province was divided into three zones for the purpose of conforming to the Dominion Regulations of the "Migratory Birds Convention Act," and the limitation of three and a half months' open season for wild-fowl shooting was adhered to.

The main divisional lines of the three districts were the Grand Trunk Pacific Railway separating off the Northern District, and the Summit of the Cascade Mountains dividing the Eastern and Western District, Vancouver Island comprising part of the latter.

Mountain-sheep were kept on the protected list south of the main line of the Grand Trunk Pacific Railway. No open season was allowed for grouse in the Eastern District north of the main line of the Canadian Northern Railway, or for willow-grouse in the Western District. The season for deer opened and closed throughout the Province on the same date, a measure which had long been advocated, and great care was taken by the Board in fixing the opening dates, wherever possible, to commence on a "Saturday," in order that sportsmen of every class might have an equal opportunity of getting out on the opening day.

The breeding season for game birds was an excellent one, and good sport seems to have been noted in practically all lines of shooting. The Spanish influenza is reported from many districts as having deterred hunters from making full use of the open seasons, and this applied particularly to trappers. The usual regrettable accidents, due to the careless handling of firearms, have to be reported, and one particularly distressing case occurred of two men being lost in the Malahat District (one of whom died from exposure) when comparatively close to assistance. Parties headed by the Chief Game Inspector located the survivor and subsequently the body of his companion.

Game.

Dealing with the game animals and birds in detail, the following particulars are based upon the reports received from the officers in charge of the various districts and from the Chairman and members of the Game Conservation Board:—

Moose and Caribou.—In the Atlin Electoral District moose and caribou appear to be about normal in most localities, but owing to the extreme depth of snow last winter, and the long period it stayed on the ground, the loss was considerable, beyond the slaughter by man, which was somewhat facilitated by the deepness of the snow. In the Peace River District the moose have suffered considerably at the hands of the Indians.

The Deputy Inspector at Fort George reports that during November several dead moose and caribou were discovered, which, upon examination, showed lung-trouble. Pneumonia is a common disease amongst horses in the extreme North, but it is to be hoped it will not become prevalent amongst the big game. This officer, reporting on a patrol of the Ootsa and Francois Lake District, states that moose there were very plentiful.

Moose appear to be plentiful in the northern part of the Lillooet District and are spreading into the south-eastern part. Reports about caribou are equally good, particularly in the vicinity of Barkerville. In the Columbia District moose are numerous at the headwaters of the Kootenay River.

Wapiti.—Reports from the Kootenay show that a small herd of elk is pasturing around the south end of the Elk Valley Game Reserve, and a larger herd is known to be in the vicinity of the headwaters of the White River. Reports of killing elk out of season on this reserve were investigated, and evidence found that this had taken place, but it was not possible to obtain proof against any parties, as settlers near the game reserve are very disinclined to assist, and there is little doubt that they break the law themselves from time to time. It is very necessary to station an officer in the vicinity of this reserve for at least a portion of the year.

An effort to obtain a short open season for elk, limiting the bag to the killing of one bull, was made by a few sportsmen. The request, however, was refused by the Game Conservation Board, as there had been no reports of an increase in the quantity of elk to warrant such a course, and, besides, the Board considered that after so long a closed period it would have been unfair to sportsmen then absent at the war to allow an open season.

The Elk liberated at Bridge River appear to be doing well. Two small claims for damages were paid by the Department to Indians for damage done by these animals to their crops. This is an unavoidable feature of liberating half-domesticated animals for propagation purposes, and one which has been experienced in the State of Wyoming, where the principal effort to preserve the elk has been attempted.

Mountain-sheep.—In the North the severity of last winter drove the bands to accessible spots where they became an easy prey to the Indians. In all portions of the Province where they are to be found they were reported to be somewhat scarcer. It was considered advisable by the Game Conservation Board that the season should only be open for sheep north of the main line of the Grand Trunk Pacific Railway, thus affording the Lillooet and Kootenay Districts an opportunity to recuperate.

The Chairman of the Game Conservation Board, in reporting his trip through Eastern British Columbia and Northern Alberta, wrote as follows:—

"The greatest menace to our big game is from the Indians crossing into the moose and sheep districts of East Kootenay; their method of procedure being to surround a mountain and commence what is known as a 'drive.' This means driving the game to the top of the mountain and then slaughtering everything possible. The Indians, especially the Chilcotin tribe, situated on the Fraser River near Alkali Lake, do more harm in this section in one season than all true sportsmen could do in years.

"At the junction of the Chilcotin and Fraser Rivers is a considerable area of land that has been the home of Rocky Mountain sheep for ages. Six years ago, to my personal knowledge, there were perhaps two or three hundred sheep in this section; during this visit I was creditably informed that there were not more than thirty or forty sheep in all, the Chilcotin Indians depleting the herds. I would very strongly recommend this district being made a reservation, and the whole district from Canoe Creek to Williams Lake on the east of the Fraser River, and from Gang Ranch to Chimney Creek on the west of the Fraser River, being made into an organized district, so that the Game Department can control the hunting, especially by Indians."

The regulations with regard to sheep appear to have met with approval, the only objections being from professional guides, whose interests in reality were being protected, although they may have lost a few hunting-parties for one season.

Bear.—The Game Conservation Board has recommended that the present open season all the year round for bear be terminated on June 30th, 1919, and that a short close season be effective until the fall hunting begins. Grizzlies are one of the chief attractions to many non-resident hunters, and this protection should be afforded to so valuable an asset to our big game.

Mr. A. Bannon, of Portsmouth, Ohio, whilst on a spring bear-hunt in the North, killed an unusually interesting bear, which he describes as having a full coat of long silky hair, black as coal, except on the sides, where it was a beautiful grey. It also had the usual brown markings about the face of a black bear, and the whole make-up was undoubtedly that of the ordinary black-bear species. Two or three fur-buyers pronounced it a Glacier bear.

Deer.—Successive hard winters with increasing depredation of predatory animals have materially reduced the deer in northern and middle portions of British Columbia. In the Lillooet District, west of the Fraser River, formerly one of the finest game territories, including the Yalakom Game Reserve, mule-deer have been greatly depleted by cougars and Chilcotin Indians. The latter are an annual source of trouble, and this district should be declared organized, which would assist the police in giving better game-protection here.

In the lower portion of the Province deer seem to be normal in quantity. It is increasingly difficult, however, to ascertain what number of Coast deer are killed during the open season, where hunting is easily accessible from the larger cities and towns. The Acting Chief Game Inspector reports as follows:—

"With regard to the deer, the season has been what one might call only fairly good. At one time it was fairly easy to get an estimate of the number of deer brought in, as most of them were brought in on the trains; now about 90 per cent. of the deer are brought in by automobile, which makes it impossible to get an idea of the number."

Wild-fowl—The limitation for wild-fowl shooting to three and a half months, under the "Migratory Birds Convention Act," raised serious difficulty in meeting the requirements of all districts. This especially applies to the Coast, where weather conditions greatly vary the advent of the birds. Recommendations and opinions differed radically as to what periods were best for shooting in each zone, and subdivisions of the zones fixed were found to be necessary.

In the Northern District the season was opened on August 15th, but a subsequent amendment to the Game Regulations for geese was adopted, to allow of a different period on that part of the Coast to the north of Vancouver Island, which formed part of the Western District.

Some dissatisfaction was expressed by hunters in the Comox Electoral District at the lateness of the geese season on Vancouver Island, but this season was fixed at the express wish of the sportsmen attending the open meeting.

In the Eastern District a subdivisional line was taken by the Canadian Northern Railway, the season to the south of this line opening on September 14th, twelve days after the territory to the north of it.

The Chairman of the Game Conservation Board, reporting on the wild-fowl shooting in this district, writes as follows:—

"Ducks and geese have been plentiful from Clinton to Springhouse Mountain, or all that part in Lillooet east of the Fraser River. The season there is short, really only lasting from September 15th to November 1st, as after that they leave on their southern flight; this flight passing between the Cascade and Selkirk Mountains, and then to Eastern Washington, Idaho Mountains to the Gulf of Mexico."

And referring further to the Lower Mainland:—

"Ducks throughout the entire valley of the Fraser have been very plentiful this season, affording excellent sport. The shortening of the open season under the 'Migratory Birds Convention Act,' although at first meeting with a great deal of disfavour in this Province, has proven to be of great benefit, and the sportsmen are realizing that it will be of still greater benefit from year to year. We have excellent breeding-grounds tributary to the Fraser River, and the shortening of the season will make it favourable for ducks to remain at these points undisturbed, and consequently will greatly increase the number of local birds."

An innovation was made by the Game Conservation Board in fixing the bag limit to twenty ducks per day, and, on the whole, birds seem to have been plentiful this year.

Grouse.—The Game Conservation Board, following a resolution passed by the sportsmen, recommended a close season for willow-grouse on the Western District, as the stock of birds had been reported low, even though the breeding season had been a favourable one.

All reports from the Eastern District indicate that grouse are scarcer in the Interior, despite two previous close seasons. To the south of the Canadian Northern Railway an open season was allowed for all grouse, except prairie-chicken, but the actual railway-line proved too sharp a line of demarcation, and it has been suggested that the Dominon Railway Belt be used as a subdivisional line. In the same manner the Grand Trunk Pacific Railway line affected settlers in that immediate locality. The Deputy Inspector at South Fort George comments on it as follows: "The Grand Trunk Pacific main line as a boundary demarcation between Northern and Eastern Division seems too arbitrary."

Prairie-chicken.—A short season for two weeks in the Greenwood and Grand Forks Electoral Districts was the only shooting allowed for prairie chickens. In the Interior encouraging reports have been received as to their increase. The Chairman of the Game Conservation Board, who recently visited Mr. Lawton, the Chief Game Guardian of Alberta, with a view to co-operating with him on all game matters relating to the two Provinces, states that Mr. Lawton has kindly consented to allow this Department to take what is considered necessary of both species of prairie-chicken from Alberta next spring, with a view to improving our own stock, which has been seriously reduced by too much inbreeding.

Quail.—These dainty little birds were very abundant on Vancouver Island, and a liberal bag limit, which was fixed at twenty per day, has not seriously depleted their number. Quail are also reported plentiful and doing well around the southern end of the Okanagan Valley.

Pheasants.—In allowing hen pheasants to be shot for the first time since these birds were introduced, the Game Conservation Board ultimately settled a much-discussed policy. Whilst admittedly a number of young hens have been killed, any damage in this respect to the stock has been greatly offset by the killing-off of a percentage of old hens, and thus checking inbreeding. Moreover, the pheasant is an "imported" bird, and both eggs and young birds are easily purchasable. The former bag limit of six birds per day was adhered to, with the revision that two of such birds were allowed to be hens. The Chairman of the Game Conservation Board dealing with this matter, writes as follows:—

"Pheasants were very plentiful everyhere in the Fraser Valley, and also on all Gulf Islands where land was cultivated. I have made careful investigations since the closing of the pheasant season, November 26th, with a view of ascertaining what stock is left for breeding, and I find that there are still plenty of birds, and I believe that the open season for hen

pheasants will prove highly beneficial, especially as your Department will be in a position to liberate a large quantity of new birds next summer. There is now in the pens at Oakalla quite a number of birds that will not be needed for breeding and can be liberated as soon as information is gathered as to where they are most needed."

For the first time an open season of three days for cock pheasants only was allowed in South Okanagan, where reports indicated that pheasants had been doing well and the cocks were getting too numerous. From such information as could be gathered it appears that about 100 birds were killed.

European Partridges.—In the Delta District, on the Lower Mainland, these birds are not doing so well as on Vancouver Island, and the introduction of some fresh blood is advisable. Not many birds appear to have been shot in North Saanich during the two days' open season, although they were quite plentiful both there and in South Saanich.

RED DEER.

The Game Conservation Board decided to liberate the English red deer which had been kept in captivity at the Oakalla Prison Farm since their arrival from New Zealand in the spring of 1914. During June last they were accordingly sent to Queen Charlotte Islands and turned out on the south side of Masset Inlet, where shortly after their arrival a fawn was born. The herd originally consisted of four fawns; now there are seven animals (one buck, four hinds, and two fawns).

Mr. Dunning, of Auckland, New Zealand, who kindly presented these animals in the first instance, wrote during the year saying that he would be glad to furnish another shipment of his English red deer, and as the introduction of new blood is now very important, it would be well for the Department to immediately avail itself of his generous offer. In view of the success which the introduction of these deer in New Zealand has met with, there should be little or no difficulty now in establishing them in this Province, seeing that the first consignment has proved that they can be successfully acclimatized.

NON-RESIDENTS.

In spite of a reduction in the bag limit, the number of big-game hunters in the Cassiar District exceeded that of last year. Bag limits were obtained, with the exception of mountain-goat, in almost every case by hunting-parties, which included two ladies.

It is also interesting to note that, under the new schedule of fees for big game killed, receipts averaged $203.63 per hunter in the Telegraph Creek District this year, but while the gross receipts exceeded those of last year by $380, the average of fees collected throughout the Province from each hunter amounted to only $68.03. During the previous year the licence fee under the "Game Act" was $100 for each licence.

INDIANS.

Without exception, the most difficult problem confronting the Game Conservation Board in their effort to preserve the game in the Province is to find ways and means for checking the wanton destruction of game by the Indians. Where formerly tribes had a mutual understanding as to the territory over which they should hunt, these arrangements seem to have largely lapsed, and the restraint on killing game unnecessarily, formerly self-imposed, has given away to a policy of killing all they can while it lasts. The Deputy Inspector at Fort George, on reporting on the Indians in his District, says, with a good deal of truth: "It must always be borne in mind that Indians were this country's original inhabitants, and that their descendants, not unnaturally, nourish the belief that all game is theirs and every white man's trap-line an encroachment on vested rights."

Complaints are frequent of Indians cutting beaver-dams and breaking up beaver-houses.

FUR TRADE.

The prices to which furs have increased during the past few years have drawn more attention to the valuable asset which this Province possesses in its fur-bearing animals. The sale of trappers' licences this year has increased by 400 and fur-dealers from all over the American Continent have their agents in the most convenient districts for obtaining the choicest pelts.

The Chief Constable at Fort St. George, one of the main exporting centres, states that fur to the value of approximately $300,000 was exported during the winter of 1917-18, and commenting on this remarks: "These buyers are making more from the fur than the licensed trappers, and should be made to pay for such a profitable occupation, besides giving the Department a much better idea of the fur shipped from the Province. A fur-buyer at the present time runs around the country buying fur from every one or any one, whether licensed or not."

It would appear that if the fur-trader, both resident and non-resident, were required to have a licence and report as to the fur purchased and exported, a more definite idea of our annual fur trade could be arrived at. In addition, administrative assistance would be given to this Department by having some control on outside buyers, and thereby assisting to prevent the traffic in unprime pelts caught out of season.

From the returns furnished by trappers for the season 1917-18, it would appear that there had been a general falling-off from the previous year in the number of fur-bearing animals taken, as will be seen from the following comparative list:—

	Returns from 947 Trappers, 1916-17.	Returns from 869 Trappers, 1917-18.
Beaver	7,140	5,916
Marten	5,517	5,031
Otter	236	190
Mink	2,958	2,485
Racoon	627	654
Fox	702	483
Musk-rat	15,991	13,398
Lynx	4,380	2,456
Wild-cat	88	195
Weasel	11,444	13,175
Wolverine	250	195
Fisher	641	518

FUR-FARMING.

Fox-farmers evidently have not met with much success during the past year. The following firms have reported they are discontinuing this business: W. McCullough, Pouce Coupe; W. E. Lennox, Telegraph Creek; Pacific Silver & Black Fox Co., Revelstoke; E. Haenell, Atlin; O. A. Haywood, Fort Fraser.

Owing to the remoteness of the districts in which certain farmers are located, reports have not yet been received from all of those engaged in the business.

The following is a list of fox-farms at present being operated in this Province with the number of foxes in captivity:—

Name.	Address.	Old Foxes.			Pups bred in Captivity.			Total.	Additional Foxes lost or disposed of.		
		Silver.	Cross.	Red.	Silver.	Cross.	Red.		Died.	Killed.	Sold.

PROVINCE OF BRITISH COLUMBIA

REPORT

OF THE

PROVINCIAL MUSEUM

OF

NATURAL HISTORY

FOR THE YEAR 1918

PRINTED BY
AUTHORITY OF THE LEGISLATIVE ASSEMBLY.

VICTORIA, B.C.:
Printed by WILLIAM H. CULLIN, Printer to the King's Most Excellent Majesty,
1919.

To His Honour Sir Frank Stillman Barnard, K.C.M.G.,

Lieutenant-Governor of the Province of British Columbia.

May it please Your Honour:

The undersigned respectfully submits the Annual Report of the Provincial Museum of Natural History for the year 1918.

J. D. MacLEAN,

Provincial Secretary.

Provincial Secretary's Office,

Victoria, March 7th, 1919.

PROVINCIAL MUSEUM OF NATURAL HISTORY,

VICTORIA, B.C., March 7th, 1919.

The Honourable J. D. MacLean, M.D.,

Provincial Secretary, Victoria, B.C.

SIR,—I have the honour, as Director of the Provincial Museum of Natural History, to lay before you the Report for the year ending December 31st, 1918, covering the activities of the Museum.

I have the honour to be,

Sir,

Your obedient servant,

FRANCIS KERMODE,

Director.

PROVINCIAL MUSEUM REPORT

FOR THE YEAR 1918.

Since the last Annual Report, although no actual field-work was undertaken, a great deal of time was devoted to the study collection in going through the specimens which have been collected from time to time and are stored in the annex. All the specimens have been rearranged, labelled, and listed, so as to make them more accessible to those who wish to consult them in the several branches of natural sciences.

In this building, which is not in any way fire-proof, is stored a very large and valuable collection of anthropological material, which, if it were to be destroyed by fire, would be impossible to duplicate; this also applies to a large number of totem-poles in the basement under this building. The older people of the aboriginal races of this Province are fast disappearing, and as the younger people do not appear to have any interest in the work done by their forefathers, it will be only a short time at the longest when all the old wood-carvings will be a thing of the past; although without doubt, in many portions of the Province, archæological specimens of the stone age may be unearthed in the vicinity of some of their old camp-sites.

This building also contains the Museum study series of bird-skins, numbering over 4,500 specimens. A number of the leading museums and ornithologists make application for the loan of specimens from time to time for comparison in determining species and subspecies, also for working out the distribution and migration of birds on this continent. The same applies to the mammal study collection, numbering nearly 1,500 specimens.

There is no way of accurately recording the number of visitors who visit the Museum during the year, as a large number of people, including children and Orientals, do not sign their names; however, a glance at the register shows that the average attendance is maintained, as over 30,500 persons having recorded their names in the book which is placed in the entrance-hall for that purpose.

It will be seen from the report on the Botanical section, written by Mr. W. R. Carter, Assistant Biologist, that Professor John Macoun, of Sidney, B.C.; J. M. Macoun, C.M.G., Chief of the Biological Division, Ottawa; Dr. C. F. Newcombe, Victoria; and others have still maintained their friendly interest in the Provincial Herbarium, by presenting specimens to fill in the gaps, principally of the Vancouver Island flora, and as Director I am pleased to say that in the Herbarium to-day there is to be found almost every plant and flowering shrub that is to be found on or recorded from Vancouver Island.

A large number of the specimens that were added this year to the Herbarium had been collected by Mr. W. R. Carter before he was appointed to the staff of the Provincial Museum.

Mr. E. H. Blackmore has continued to carry on the systematic work in the Entomological section; this work is done by Mr. Blackmore gratuitously, and he has written considerable material of interest to entomologists in this report, giving descriptions of new and rare specimens recently described or found in this Province.

A great deal of the time of the Director has been taken up with game matters during the year. I was instructed by the Attorney-General's Department to go over to Vancouver in the latter part of March, and take over the Game Department temporarily before it was handed over to the administration of the Provincial Police. This necessitated the Director being in Vancouver a considerable time each week until the offices were transferred to Victoria. The Director was also made Secretary of the Game Conservation Board by Statute, and has to give considerable of his time to that work, which is under the administration of the Honourable Attorney-General's Department.

The Director hopes that, if funds will permit this year, to carry on more scientific research in the field, so as to fulfil the object of the Provincial Museum.

Very little anthropological material was secured during the year; several small collections were offered to the Department for purchase, but owing to the fact that the appropriation was so limited and the strictest economy was to be exercised, it was thought advisable not to make any of these purchases at present. However, several good specimens of stone pestles (Nos. 3138

and 3139), also stone chisels (Nos. 3140, 3141, and 3142) and spear-points (Nos. 3143 to 3147), were collected many years ago at Port Haney, and presented by Mr. Hector Ferguson, of Vancouver, B.C., to the Provincial Museum. These specimens had been sent to the Provincial Library by mistake some time ago; however, they were finally located and transferred to this Department.

ENTOMOLOGY.

By E. H. BLACKMORE.

Very little field-work has been done during the past season, but some of the material taken by the Museum collectors during the past three years has been further worked over and many interesting facts brought to light. We have kept in touch with several of the collectors in various parts of the Province, and have obtained some new records, together with an added knowledge of the distribution of many of our species, the results of which are embodied in the following pages.

The weather conditions were vastly different to those of the previous seasons; during the last three weeks in April of this year (1918) we had a continuation of bright sunshine with a temperature far above the average, which brought about the emergence of many species far in advance of their normal times of appearance. Amongst the Geometridæ this was especially noticeable, as in many cases they were from four to six weeks earlier than usual; in one case, *Cosymbria lumenaria*, a difference of two months, a specimen being taken in fine condition on April 27th in the Lower Fraser Valley. My earliest previous record of this species is June 15th, 1915, that particular year being rather an early one. It is generally taken from the first to the middle of July.

In August we had a very wet month (I am now referring to Vancouver Island and the Lower Fraser Valley), which is very unusual, as that month is practically the hottest and driest of the whole year. A very noticeable feature of the past summer was the prevalence of high winds for continued periods, a factor which militates greatly against the collection of specimens, especially of diurnals and geometers who will not attempt to fly in the face of a strong wind.

One of the outstanding features of the season in this district was the remarkable scarcity of noctuids, this being the poorest season by far, for many years, from a collecting point of view, although in the Interior conditions did not seem quite so bad.

The damage done by cutworms this year was very light as compared with the two previous seasons; this was rather to be expected, as the season following a particularly heavy outbreak is generally comparatively light, owing to the heavy increase of parasitism amongst the larvæ and pupæ, thus enabling nature to restore her balance.

Unfortunately, to offset this, there was a very heavy infestation of the forest tent-caterpillar (*Malacosoma pluvialis* Dyar); in fact, the heaviest infestation we have had for many years. In normal years they confine themselves to the trees and bushes on vacant lots and on the roadside, but this year they were in such numbers that they attacked everything in sight, invading gardens and orchards and defoliating all kinds of fruit and shade trees. Wherever one went their ugly, unsightly webs were in evidence. A remarkable feature of the late summer was the presence all over the Province in large numbers of *Aglais californica* Bdv. (the tortoise-shell butterfly). This butterfly occurs regularly in certain sections of the Province, but I do not think that it has ever been so abundant and reported from so many widely separated localities. Mr. W. B. Anderson, Dominion Inspector of Indian Orchards, reported it from Fort George right through to Stuart Lake, all through the Cariboo and Chilcotin Districts down to Lillooet. In a letter under date of August 6th, Mr. A. W. Phair, who is a resident of the latter locality, says in part: "There is a very interesting outbreak here of what I take to be *Vanessa californica*. It is working at about 4,000 feet on a shrub with a heavy laurel-like leaf. The outbreak extends at least fifty miles in a straight line. The shrubs are all eaten off and one little branch would have about a hundred caterpillars on it."

Mr. Phair sent me some twenty pupæ, which emerged the day of their arrival, and it is curious to note that they are all about one-third less in size than the average, and, although I have specimens from all parts of the Province, these are the only dwarf ones I have seen. It may be the altitude, or, what to my mind is more probable, there was such an enormous number of them that they did not get sufficient food to eat, and consequently transformed into pupæ in a somewhat stunted state, which was reflected in the smaller size of the imagines. They also occurred from Cranbrook in the east, through the Keremeos District, down the valley of the

Lower Fraser, and all over Vancouver Island, quite a number appearing in Victoria, even invading the houses. This is the first time I have seen this species in this city during my eight years' residence here.

Another insect which was extremely prevalent throughout the same general localities as the one just mentioned was a noctuid moth (*Autographa californica* Edw.) commonly known as the alfalfa-looper. It is widely distributed in Western North America, but was only known as a pest in Canada since 1914, when a very severe outbreak occurred in this Province. It was so abundant that summer on Vancouver Island that wherever one went a score or more would fly up out of the grass at nearly every step one took. It belongs to one of the few groups of noctuid moths which fly in the daytime, and it is also attracted to certain flowers about sundown.

An important discovery of what may prove to be a serious pest was made by Mr. W. B. Anderson at Chase, B.C., in the early part of August, where one of the tussock-moths (*Hemerocampa vetusta gulosa* Hy. Edw.) was found to be devastating the Douglas fir. Further notes on this moth will be found under the heading of "Illustrated Lepidoptera."

Another interesting and important discovery, especially from an economic aspect, was the finding of the apple-maggot fly at Royal Oak, B.C., by Mr. W. Downes, Field Officer, Entomological Branch, Dominion Department of Agriculture, who is in charge of the Vancouver Island District. It has been identified by Dr. J. M. Aldrich as *Rhagoletis pomonella*. The only previous record of this fly in British Columbia is two specimens taken by Mr. R. C. Treherne at Penticton, B.C., on July 26th, 1916. Mr. Downes has also discovered that the host-plant is the common snowberry (*Symphoricarpus racemosua*) and has bred a number of flies from it. In Eastern Canada it is one of the worst of the fruit pests, but so far no signs of its attacking the apple in British Columbia have been observed.

Rare and Uncommon Insects taken in British Columbia during 1918.

In continuing this section, as was proposed in last year's report, we would like to impress upon the entomologists of this Province, especially those residing in the more outlying districts, the necessity of sending in records of their important captures, accompanied by full data, by December 31st of each year. It is only by this means that we shall get a fuller knowledge of our British Columbia species and their distribution, a knowledge which is most essential both from an economic and a taxonomic standpoint.

Victoria.—Although, as stated previously, the season was a poor one for noctuids generally, the writer has been fortunate in picking up a few species of more than passing interest.

A male specimen of *Apantesis ornata complicata* Wlk. was taken on June 16th. This pretty tiger-moth occurs regularly, but is very uncommon; three specimens in any one year in this district is the most that I have any record of.

On April 12th I took one specimen each of *Xylomyges rubrica* Harv. and *X. perlubens* Grt., at rest on an electric-light pole. These are the first records I have of these two species occurring in Victoria.

In Vancouver *rubrica* occurs regularly with *pulchella*, although much less common. *Perlubens* is plentiful at cherry-blossoms in some districts on the Mainland.

A specimen of *Trachea impulsa* Gue. was taken at light on July 6th, which is also a new record for this district; it has previously been recorded from Kaslo. Another new record for this district is *Autographa metallica* Grt., a specimen of which I took on June 21st; it occurs at Agassiz and in the Kettle Valley District. Other rare noctuids taken were *Polia variolata* Sm. and *Septis plutonia* Grt.

Amongst the Geometridæ it is interesting to note that two specimens of *Diactinia silaccata albolineata* Pack. were taken here for the first time, although I have taken it at points farther up the Island. One specimen was taken on April 30th in fine condition on a store window, and the other at rest on a fence on July 24th, thus indicating that it is double-brooded. Two specimens of *Hydriomena edenata grandis* B. & McD. were taken on electric-light poles on March 16th. They were both females, but could not be induced to lay eggs. This species is rather scarce here, although it is much more plentiful at Duncan, forty miles north of here.

Mr. W. Downes, of Oak Bay, took a nice specimen of *Polia restora* Sm. on August 3rd. This also occurs regular, but not more than one or two seem to be captured in any one year. He also took a specimen of that pretty little noctuid, *Sarrothripus revayana columbiana* Hy. Edw., on April 8th. This species seems exceedingly rare. Mr. Downes also took a geometer not previously

recorded from Victoria—viz., *Euphyia luctuata* Schiff—on June 14th; also another specimen of *Eupithecia borealis* Hulst., the first records for British Columbia of this species being mentioned in last year's Museum Report, page 12.

Mr. W. B. Anderson whilst collecting noctuids at light took a nice specimen of the peach-blossom moth (*Euthyatira pudens* Gue.). This is an exceedingly rare moth in this district. He also took a short series of *Hydriomena crokeri* Swett on April 29th. This geometer is as a rule very uncommon and is extremely local. I do not know of any other locality in British Columbia where it has been taken, and even here it seems to be restricted to one section of the city. The same collector took a single specimen of *Erannis vancouverensis* Hulst. on November 30th. This is the first record since I took a solitary specimen here on November 22nd, 1914.

Mr. W. R. Carter, Assistant Biologist of the Provincial Museum, took a fine specimen of that uncommon noctuid, *Rhynchagrotis niger* Sm., on July 15th; also a specimen of *Autographa rectangulata* Kirby, which is a new record for this district. In the Report of the Provincial Museum, 1917, p. 12, mention was made of the taking of a specimen of *Neptyia phantasmaria* Streck, which, together with one other, were the only known records from Victoria. It is interesting to note that Mr. Carter took a specimen on September 16th in Beacon Hill Park; from that time on he visited the park daily, with the result that up to October 3rd he had taken twenty-six specimens (twenty-four males and two females). It has evidently started to breed here, and as it is a pine-feeder there is no doubt but what it will become established here from now on.

My theory is that odd specimens come over on the boats from Vancouver, where it is extremely common in September. They are probably attracted by the bright lights of the ship at night at Vancouver, and settle on some portion of the rigging, flying off the next morning in Victoria, as all specimens found have been in the immediate vicinity of the sea-shore.

Goldstream.—On July 3rd the writer took a trip up Mount MacDonald, one of the mountains to the south of Goldstream, and was fortunate enough to take a couple of male specimens of *Plebeius melissa* Edw., a rather rare butterfly on Vancouver Island. I was pleased to take this, as it had been eliminated from the 1906 Check-list of B.C. Lepidoptera, and I was rather undecided as to its inclusion in a new Check-list which is in preparation.

On another trip on July 5th to Mount Braden, which is west of Goldstream, I took a geometer which at first sight seemed new to me, but later I recognized it as *Stamnoctenis morrisata* Hulst., the first specimen of which was taken at Duncan last year (*vide* Report Provincial Museum, 1917, p. 13). I went again on July 8th to the same place and succeeded in taking another one, but an extended search failed to reveal any more specimens. Both of them were males and in fine condition.

Mr. A. W. Hanham, of Duncan, also took two at light and Mr. G. O. Day took one at Maple Bay, so the species looks like it was going to become established.

Other Heterocera of interest taken by the writer at Goldstream were *Autographa mappa* G. & R.; *A. corusea* Streck; *Enypia packardata* Tayl.; and *Hyperetis trianguliferata* Pack.

Vernon.—Mr. W. Downes took a specimen of *Picris beckeri* Edw. on September 30th. This butterfly seems very uncomomn and is rare in British Columbia collections. He also took a fine specimen on May 24th of *Acronycta mansueta* Em., a rather rare noctuid, and a specimen of *Xanthorhœ ferrugata* on the same date, a geometrid which is not at all common.

Mr. M. Ruhman captured on April 26th one of our rarest arctids—*Phragmatobia fuliginosa borealis* Staud. To my knowledge there have been only three specimens taken in British Columbia—the one just mentioned, one taken by the late Captain R. V. Harvey at Vancouver on April 23rd, 1907, and one taken at Alberni, V.I., by Mr. W. R. Carter in May, 1915.

Kaslo.—Mr. J. W. Cockle has taken a specimen of *Macaria purcellata* Taylor, which is the first that has turned up since the types were taken; he has also taken *M. minorata incolorata* Dyar., which is a very rare geometer and was described from Kaslo in 1904.

NEW BRITISH COLUMBIA INSECTS.

The following twelve insects have been described as new to science during the year 1918. They comprise four species of Lepidoptera, three species of Hymenoptera, and five species of Diptera.

Lepidoptera.

In Cont. Lept. No. Amer., Vol. IV., No. 2, p. 137, May, 1918, Messrs. Barnes and McDunnough describe a new geometrid under the name of *Eustroma fasciata*, from Ketchikan, Alaska, and Cowichan Lake, Vancouver Island, B.C. The types are one male and three females, one of the females being taken in June at Cowichan Lake. This new species is closely allied to *E. nubilata* Pack, which is fairly common throughout the Province, especially the second brood in the early fall. The chief distinguishing features are that in *fascita* the antemedian white band has much more regular edges and is less bent in at the costa, also that there is no trace of any yellow shading.

Hydriomena macdunnoughi Swett is described in the Can. Ent., Vol. L., No. 9, p. 296, September, 1918, from specimens taken at Atlin, B.C., on June 11th, 1914, by Mr. E. M. Anderson. This new species bears a close superficial resemblance to *H. ruberata* Frey., but differs materially in the male genitalia. In the 1906 Check-list of British Columbia Lepidoptera, *ruberata* was erroneously listed as occurring at Kaslo; we have no authentic records of the occurrence of this species in any part of British Columbia.

Microlepidoptera.

In the Can. Ent., Vol. L., No. 7, p. 231 *et seq.*, Annette F. Brown describes several new species of Microlepidoptera, two of which are described from Field, B.C. One of them belongs to the family Yponomeutidæ and is named *Swammerdamia cuprescens*. Four species were bred from larvæ feeding from birch; they are gregarious and live in webs, pupating in August and appearing the following May. Larvæ were also taken at Glacier, B.C., feeding on alder, but for some reason or other failed to reach maturity. It is a close ally of the European *S. heroldella*, which is also a birch-feeder. The other one belongs to the family Gracilariidæ and is called *Ornix spiræifoliella*. This species is a leaf-miner and feeds on the under-side of the leaves of *Spirea sp.;* this also pupates in the fall and emerges in the following spring.

Hymenoptera.

The Ottawa Naturalist, Vol. XXXII., No. 4, p. 71, October 1918, contains a key to the species of the genus *Vespa*, occurring in Canada, by F. W. L. Sladen. In the course of his paper he describes four new forms, three of which occur in Canada and one in Alaska. The three occurring in Canada also occur in British Columbia and are as follows:—

(1.) *Vespa norvegicoides*, which has a range from Nova Scotia to British Columbia. It is closely related to *diabolica* Saus., which is our commonest wasp, and differs from it, amongst other minor details, by the yellow band on segment, one being narrower and uninterrupted; by the male antennæ being black beneath instead of testaceous; and by the hairs being longer and less dense.

(2.) *Vespa acadica*, recorded from Nova Scotia, New Brunswick, Ontario, and British Columbia; the specific localities for British Columbia being given as Kaslo and Victoria. This species makes an aerial nest and is near to *vidua* Saus., which occurs only in Ontario, as far as Canada is concerned.

(3.) *Vespa atropilosa*, described from one female and many workers. The female was taken at Lethbridge, Alta., while the workers or neuters were all taken in British Columbia, specific localities recorded being Vernon, Okanagan Landing, and Keremeos.

It is interesting to note that, out of eleven species of wasps known to occur in Canada, as many as eight of them are taken in British Columbia; these are enumerated in the following list:—

Vespa maculata Linn. This is the well-known "black hornet," which makes an aerial nest.

V. diabolica Saus. This species is found in Southern British Columbia up to an altitude of 5,000 feet.

V. norvegicoides Sladen.

V. arctica Rohw. (= *borealis* Lewis). Parasitic in nests of *V. diabolica*.

V. occidentalis Cr.

V. austriæa Pz. This a parasitic species and so far has only been recorded in this Province from Kaslo, in mid-July.

V. acadia Sladen.

V. atropilosa Sladen.

Diptera.

In the Annals of the Ent. Socy. of America, Vol. XI., No. 4, December, 1918, Mr. F. W. Pettey gives "A revision of the genus *Sciara* of the family Mycetophilidæ. In the course of his revision he describes some thirty new species from North America, two of which are from British Columbia. The first is *Neosicara lobosa*, described from one male collected at Carbonate, B.C., by a Mr. J. C. Bradley in July, 1908, at an altitude of 2,600 feet. Carbonate is situated about twenty miles south-east of Golden.

The other is *Neosciara ovata*, described from one male taken at Howser, B.C., by Mr. Bradley on June 22nd, 1905. Howser is situated on the Lardeau River about thirty-five miles north of Kaslo. It would be as well to state here that *Neosciara* is a new genus erected by Mr. Pettey, to include those species which have no setæ on the cubitus and media, and which would formerly have been placed under the old genus *Sciara*, which have setæ on these veins.

Two species of the genus *Drapetis*, belonging to the family Empididæ, are described by A. L. Melander in the Annals of Ent. Socy. Amer., Vol. XI., No. 2, June, 1918. The first is *Drapetis alternigra*, which is very widely distributed, it being found in New York, Massachusetts, Pennsylvania, South Dakota, Texas, and British Columbia. The second is *Drapetis infumata*, described from two specimens, the type specimen being taken at Nelson, B.C., on July 17th, 1910, and the paratype at Priest Lake, Idaho, on August 1st, 1915.

Sarcophaga vancouverensis Parker is described in the Can. Ent., Vol. L., No. 4, p. 122, April, 1918. This new species was described from eight specimens (seven males and one female) taken by Mr. R. S. Sherman on Savary Island, B.C., and at Vancouver, B.C., on various dates from May 12th to July 3rd, 1916.

We extend our congratulations to Mr. Sherman on his discovery of a new species, as he has done so much to advance our knowledge of the dipterous fauna of this Province.

We would like to mention an article written by Dr. A. E. Cameron (who was Dominion Field Officer in charge of the pear-thrips investigation at Royal Oak, B.C., for two years) and published in the Annals of the Ent. Socy. Amer., Vol. XI., No. 1, March, 1918. The article is entitled the "Life-history of the Leaf-eating Crane-fly, *Cylindrotoma splendens* Doane." It gives a complete account of its habits and its life-history from the egg to the image.

It is illustrated with some very fine drawings by the author, representing the larvæ and its most important parts, the pupa and the image. The larvæ of this crane-fly was discovered at Westholme, on Vancouver Island, some forty miles north of Victoria. The value of the discovery lies in the fact that this represents the first finding of the immature stages of any species of this genus on the American Continent.

ILLUSTRATED LEPIDOPTERA.

We have thought that it may be of more interest and benefit to the entomologists in various parts of the Province to describe more fully the insects illustrated in the plates contained in the Annual Reports of the Provincial Museum, and a beginning is made with those moths figured on the two plates accompanying this article. The species in the following annotated list are given in their proper scientific order, the numbers appearing before each name corresponding with a similar number in Messrs. Barnes and McDunnough's Check-list of No. Amer. Lepidoptera, February, 1917. Those with a star prefixed to them have been described since that list was published.

Noctuidæ (Plate I.).

1315. *Euxoa quinquelinea* Sm. This is a moth that has not hitherto been recorded from British Columbia. Recently, upon working over a collection of noctuids made by Mr. W. H. Danby at Rossland, B.C., some twenty years ago, I found several species that were entirely new to me. These were subsequently submitted to Dr. J. McDunnough, of Decatur, Ill., for identification, some of them proving new to British Columbia. This species is one of them; it is evidently a mountain species, as its habitat is the Sierra Nevadas of California.

E. lutulenta, which was also described by Dr. J. B. Smith at the same time (*vide* Trans. Am. Ent. Socy., XVII., p. 50, 1900), is now placed as a geographical race of *quinquelinea*. We also have a specimen of this form taken at Vernon, B.C., in 1916.

1682. *Polia negussa* Sm. This was also taken by Mr. Danby at Rossland, B.C., in 1898, and is also new to British Columbia. It was described by Smith in the Can. Ent., XXXII., August,

PLATE I.

NOCTUIDÆ AND LYMANTRIIDÆ.

Gortyna pallescens Sm.
Alberni, B.C. (W. R. Carter).
(Very rare.)

Arzama obliqua Walk.
Duncan, B.C. (E. M. Skinner).
(New to British Columbia.)

Andropolia ædon Grt.
Duncan, B.C. (E. M. Skinner).
(New to British Columbia.)

Euxoa quinquelinea Sm.
Rossland, B.C. (W. H. Danby).
(New to British Columbia.)

Ipimorpha nanaimo Barnes.
Victoria, B.C. (E. H. Blackmore).
(Very rare.)

Polia variolata Sm.
Victoria, B.C. (E. H. Blackmore).
(Very rare.)

Polia negussa Sm.
Rossland, B.C. (W. H. Danby).
(New to British Columbia.)

Autographa V-alba Ottol.
Rossland, B.C. (W. H. Danby).
(New to British Columbia.)

Hemerocampa vetusta gulosa Hy. Edw.
Chase, B.C. (W. B. Anderson).
(New to British Columbia.)

Bomolocha toreuta Grt.
Duncan, B.C. (G. O. Day).
(Very rare.)

1900, from two males and two females taken by F. H. Wooley Dod at Calgary, Alta. It is very closely allied to *segregata* Sm. and *gussata* Sm., Dr. McDunnough being of the opinion that they are probably forms of one species.

P. segregata was described from Laggan, Alta., and is recorded from Kaslo, B.C. I have a specimen of it from Sicamous, B.C. It is also a mountain form and evidently very uncommon. These two species are very much alike in maculation, *ncgussa* being more reddish-brown in colour and lacking the black markings of *segregata.*

1702. *Polia variolata* Sm. This specimen was described from Washington Territory by Smith in 1887, Proc. U.S. Nat. Mus., X., p. 467, from one male and one female. We have a specimen in the Museum collection labelled "Victoria, B.C.," and presumably taken about 1902. There is no other record of its occurrence in British Columbia that I know of until the capture of the specimen figured in the plate, on July, 1918. It must be exceedingly rare when a period of sixteen years elapses without its capture being recorded, especially in a district which is continually and regularly worked over.

2646. *Gortyna pallescens* Sm. The specimen figured was taken by Mr. W. R. Carter at Alberni, B.C., in August, 1915; one was also taken by Mr. Downes at Armstrong, B.C., on August 28th. It was also recorded in the 1906 Check-list of B.C. Lepidoptera, under the name of *medialis* Sm., as occurring at Kaslo.

In Bulletin 52, U.S. Nat. Mus., Dr. Dyar places *pallescens* as a synonym of *medialis* Sm., but in Barnes and McDonnough's new Check-list they are treated as separate, although closely allied species. In the British Columbia Check-list the name *medialis* should be eliminated, and *pallescens* substituted for it. It is interesting to note that this uncommon insect has been taken in two districts whose climatic conditions are the exact opposite of each other. Alberni being an extremely wet district, while Armstrong is in the hot dry belt.

2524. *Andropolia œdon* Grt. One specimen without date taken by the late E. M. Skinner at Quamichan Lake, near Duncan, presumably in 1896. This has not hitherto been recorded from British Columbia. Its habitat is Colorado, Nevada, and Washington. One of the types is in the British Museum.

2725. *Ipimorpha nanaimo* Barnes. This delicate ochre-coloured moth is very uncommon in this district. There is a specimen in the Museum collection taken in Victoria on August 2nd, 1898. I have no other record from here until the one I took at rest on a fence on August 18th, 1918, just twenty years later. The one in the Museum collection was determined many years ago by Dr. Smith as *plconectusa* Grt., which, although agreeing in maculation, is decidedly smaller and darker in coloration, being of a very dark fawn colour on both primaries and secondaries. The latter occurs throughout the Atlantic States, Colorado, and Utah. Mr. A. W. Hanham, of Duncan, B.C., took this latter species in Victoria many years ago, and I was fortunate enough to take one specimen in perfect condition at light on August 25th, 1916.

2784. *Arzama obliqua* Wlk. This species is new to British Columbia and was taken by the late E. M. Skinner at Quamichan Lake on June 26th, 1906. This is a very interesting record, as it is rather surprising to find it on the Pacific Coast; it is distributed over a wide area on the American Continent, from Eastern Canada south to Florida, and thence west to the Mississippi. It is a reed-feeder, the larva feeding from the top downwards until the whole of the reed is eaten out, then returning to the top and forming its pupa there. *Bellura gortynoides* Wlk. is very closely allied, and is reported from Wellington and Vancouver, although I have not as yet seen the species.

3245. *Autographa V-alba* Ottol. Taken by Mr. W. H. Danby at Rossland about the year 1900, but without specific date. This is also new to British Columbia, and was described from Wyoming by Dr. Ottolengui in Jn. N.Y. Ent. Socy., X., p. 73, 1902. It is a very pretty species and bears a strong superficial resemblance to *speciosa*, from which it can readily be distinguished by the shape of the "Y" mark.

3571. *Bomolocha toreuta* Grt. This species was referred to in the Provincial Museum Report, p. 12, 1917. In the 1906 B.C. Check-list it is reported from Cameron Lake, and one specimen was taken by Mr. R. C. Treherne at Agassiz on August 1st. This latter record would indicate that it is double-brooded, or at least partially so, as Mr. Day's specimens emerged in May from larvæ taken the previous August. The ground colour is a rich smoky brown, the white blotch in the inner margin being very striking. It occurs from New York to Texas.

LYMANTRIIDÆ (PLATE I.).

3704 (*b.*) *Hemerocampa vetusta gulosa* Hy. Edw. This moth, which has hitherto not been recorded from British Columbia, is very interesting from both a systematic and economic standpoint. It was discovered by Mr. W. B. Anderson, who is Dominion Inspector of Indian Orchards, on one of his periodical trips in the Interior. It was taken at Chase, B.C., where it was doing much damage to the Douglas fir. Imagines and full-fed larvæ were taken together on August 6th, showing it to be double-brooded. The females are wingless and live solely for the purpose of oviposition; having laid her eggs she covers them with hairy scales, which she plucks from her body and mixes them with a gummy secretion, which on drying becomes hard and brittle; as her mission in life is then ended, she dies.

The full-fed larvæ noted above spun up about August 12th, emerging in the breeding-cage on September 1st and 2nd. There are three closely allied forms—*vetusta* Bdv., described from the Coast region of California in 1852; *gulosa* Hy. Edw., described from the same general locality in 1881; and *cana* Hy. Edw., described from the Sierra Nevadas of California in the same year. After a careful comparison with the descriptions published by Neumoegen and Dyar in their "Preliminary Revision of the Bombyces of America," Jn. N.Y. Ent. Socy., Vol. II., p. 29, March, 1894, I have not the slightest hesitation in referring this British Columbia form to *gulosa*, which together with *cana* are made races of *vetusta* in Barnes and McDunnough's new Check-list. It is also a near relative of *H. leucostigma* A. & S. (the white-marked tussock-moth), whose ravages upon shade-trees and shrubbery in the Atlantic States are well known.

GEOMETRIDÆ (PLATE II.).

4002 (*a.*) *Dysstroma formosa borcata* Tayl. This is rather an interesting record, as its capture is of very rare occurrence. It was taken near Victoria by Mr. W. Downes on July 23rd, 1917. It was described in the Can. Ent., Vol. XLII., p. 87, March, 1910., from two specimens taken by Mr. T. Bryant near the Stikine River, in Northern British Columbia, on July 24th and 25th, 1905. In Barnes and McDunnough's new Check-list it is placed as a race of *formosa* Hulst., and in my opinion rightly so, as the maculation is practically the same, with the exception of the extra basal bar, which is quite distinct and perfectly black instead of red or orange.

Typical *formosa*, which was described from Colorado, also occurs in British Columbia, the writer having in his cabinet a rather poor specimen taken at Lillooet on June 23rd, 1916, and there is a specimen in the Swett collection taken by the late Mr. Livingstone at Cowichan Bay, B.C.

* *Hydriomena macdunnoughi* Swett. This specimen, new to science, is noted fully under the heading of "New British Columbian Insects."

* *Hydriomena perfracta exasperata* B. & McD. In last year's Museum Report mention was made of the new forms of *Hydriomena*, described by Messrs. Barnes and McDunnough in their revision of that group, Cont. Lept. No. Amer., Vol. IV., No. 1, May, 1917. The specimen figured is one of them and was taken by the writer near Victoria on May 19th, 1914, whilst beating for Geometridæ. It was described from two specimens, both males, one taken at Departure Bay and the other at Wellington, both localities being on Vancouver Island; it is a geographical race of *perfracta* Swett, which is taken in the Catskill Mountains, N.Y. The latter was originally described as a variety of *cærulata* Fabr. (*autumnalis* Strom), but is now considered as distinct, on account of difference in the shape of the uncus in the two forms.

4360 (*a.*) *Phasiane respersata teucaria* Stkr. This little geometrid was listed in the 1906 B.C. Check-list as *Macaria teucaria* with a question-mark; later it was determined as *respersata* Hulst., but finally it has been identified as *teucaria*, which was described from Seattle, Wash., and is really only a large form of *respersata*, whose nimotypical locality is Colorado. *Teucaria* occurs on Mount Tzouhalem, near Duncan, and although I have collected assiduously in the vicinity of Victoria for the past eight seasons, I had only taken two specimens until last May (1918), when I took thirty-seven at Mount Tolmie on May 28th. In a long series they are rather variable as regards the intensity of the markings, and also in the presence or absence of the intradiscal line; in some forms this line is present from the costa to the median vein only, giving the insect quite a different appearance. (For earlier notes on this species *see* Proc. Ent. Socy., B.C., No. 6, p. 110, June, 1915.)

4372 (*b.*) *Phasiane neptaria sinuata* Pack. Both *neptaria* Gu. and *sinuata* have been listed in previous B.C. Check-lists as occurring here, the latter being retained in the list on account

PLATE II.

GEOMETRIDÆ.

Lycia ursaria Walk.
Rossland, B.C. (W. H. Danby).
(New to British Columbia.)

Gabriola dyari Taylor.
Victoria, B.C. (E. H. Blackmore).
(Very uncommon.)

Euchlæna albertanensis Swett.
Armstrong, B.C. (W. Downes).
(New to British Columbia.)

Dysstroma formosa borcata Taylor.
Victoria, B.C. (W. Downes).
(Very rare.)

Gonodontis formosa Hulst.
Lillooet, B.C. (A. W. Phair).
(New to British Columbia.)

Phasiane respersata teucaria Streck.
Victoria, B.C. (E. H. Blackmore).

Cleora albescens Hulst.
Duncan, B.C. (G. O. Day).
(Very rare.)

Phasiane neptaria sinuata Pack.
Goldstream, B.C. (E. H. Blackmore).

Hydriomena perfracta exasperata B. & McD.
Victoria, B.C. (E. H. Blackmore).
(New to British Columbia.)

Hydriomena macdunnoughi Swett.
(Paratype male.)
Atlin, B.C. (E. M. Anderson).
(New to science.)

of its being described from one male specimen taken at Victoria by a Mr. G. R. Crotch, who collected in this district, about the year 1873. Apparently this species had disappeared, and all the specimens taken in recent years have been named *neptaria*, which was described from California.

The solution to this apparent disappearance lies in the fact that the two species are practically alike in maculation, the only difference being the larger size of *sinuata;* therefore the latter is now considered to be a northern race of *neptaria.*

Sinuata occurs right across the southern portion of British Columbia from Vancouver Island to the Rocky Mountains. The specimen figured is typical. *Neptaria* must now be eliminated from our Check-list.

4554. *Cleora albescens* Hulst. One of our very rare geometers. It was described from Seattle, Wash., by Hulst in Trans. Am. Ent. Socy., XXIII., p. 355, September, 1896. There are very few records of its capture in British Columbia. The late Rev. G. W. Taylor took it many years ago at Wellington; the late A. H. Bush took one specimen at Vancouver on May 22nd, 1902; and Mr. G. O. Day took two or three at Maple Bay, near Duncan, in August, 1911; and although it has been diligently searched for, none have been taken since. These are the only authentic records that I know of. This and *excelsaria* Strks., which was figured in Annual Report of the Provincial Museum, 1917, Plate II., were previously placed in the genus *Sclidosema;* but this genus, together with the genus *Alcis*, has been discarded, and all the species belonging to these two genera have been transferred to the genus *Cleora.*

4608. *Lycia ursaria* Walk. This is an Atlantic States species and is entirely new to our fauna; it was taken by W. H. Danby at Rossland some eighteen years ago. It was described from Albany, N.Y., in 1860, and the type specimen is in the D'Urban collection of North America Lepidoptera, which is now the property of the Entomological Society of Ontario, and is in the collection of the Agricultural College at Guelph.

4612. *Gabriola dyari Tayl.* Described from four male specimens taken in August, 1903, on Gabriola Island, opposite Nanaimo. In his description (Can. Ent., Vol. XXXVI., p. 256, September, 1904) Taylor says that it seems to be not uncommon on Vancouver Island and that he has not seen a female. It may be more common in the Nanaimo District, but it is not so in the vicinity of Victoria.

I have taken four specimens (three males and one female) in six years of collecting exclusively for geometrids. The female has the same markings as the male, but is larger, the male measuring in alar expanse 24 mm., while the female expands to 28 mm., the antennæ of the female is filiform, while the male antennæ are heavily pectinated.

4691. *Gonodontis formosa* Hulst. Taken at Lillooet on October 4th, 1917, by Mr. A. W. Phair. This species is new to British Columbia, and its capture so far north is rather unexpected, as its habitat ih Colorado and Southern California. The specimen figured is a little worn; when in a fresh condition it is evidently a rather handsome insect.

* *Euchlæna albertaensis* Swett. On looking over a collection of Lepidoptera made by Mr. W. Downes at Armstrong, B.C., a few years ago, I came across four specimens of a species of *Euchlæna* that were decidedly different to any that I had seen before. Knowing that the species going under the name of *pectinaria* Pack. in our British Columbia collection was wrongly named, I listed them provisionally as *pectinaria*, especially as they agreed fairly well with Packard's description in Mon. Geom. U.S. Geol. Survey, Vol. X., 1876. Recently in sending some material to Dr. McDunnough for identification I included one of these Armstrong specimens, and he informs me that it is *albertæensis* Swett. This new species was described in Can. Ent., Vol. 49, p. 351, October, 1917, the male type coming from Calgary, Alta., and the female type from Edmonton, Alta.

Mr. Downes's specimens comprise three males and one female, and were captured on April 25th and 30th, 1914; they are the only specimens I have seen, although I have worked over considerable material taken at Vernon and Okanagan Landing during the last three years.

Mr. Downes informs me, however, that the insect fauna of Armstrong in some respects differs very materially from that of Vernon, although the two localities are only twelve miles apart. There is more bush at Armstrong and the climate is more humid. It may be as well to state here that the moth going under the name of *pectinaria* in local collections is in reality *E. tigrinaria sirenaria* Streck.

BOTANY.

As no field-work of any description was undertaken during the season of 1918, there is little to chronicle in the Botanical section of the Provincial Museum during this period; however, the collection in the Provincial Herbarium has been materially increased and a number of specimens not hitherto in the collection have been added from the following sources:—

Additions to the collection of Professor John Macoun, received from Mr. J. M. Macoun, Chief of the Division of Biology, Geological Survey, Ottawa:—

MARSILEACEÆ.

Marsilea vestita Hook.

SALVINIACEÆ.

Azolla caroliniana Willd.

LYCOPODIACEÆ.

Lycopodium annotinum L., var. *alpestre.*
Lycopodium selago L.
Lycopodium selago var. *miyoshianum* Makino.
Lycopodium sitchense Rupr.

NAJADACEÆ.

Phyllospadix scouleri Hook.
Phyllospadix torreyii Wats.

Hypnum curvifolium Hedw.
Hypnum fluitans Linn.
Hypnum hamulosum Bruch & Schimp.
Hypnum lycopodiodes Schwaegr.
Hypnum uncinatum Hedw.

A small collection of grasses and plants collected in British Columbia by Mr. J. M. Macoun.

A short series from Lytton collected by Mr. W. B. Anderson. A collection of Vancouver Islands plants, approximately 650 specimens, from W. R. Carter, Assistant Biologist. This collection was made prior to Mr. Carter being appointed to the staff of the Provincial Museum, and it represents chiefly the flora of the Alberni District and illustrates the luxuriant growth of the Humid Transition area; this collection includes original specimens of a number of plants not previously recorded from Vancouver Island, together with two which are new to Canada.

These collections have been mounted by Miss H. J. Hendry, Recorder in the office of the Museum, and placed in the Herbarium of the Provincial Museum.

The following list taken from these collections are additions not previously in the collection:—

Polypodium scouleri Hook. & Grev.
Adiantum pedatum L., var. *aleuticum Rupr.*
Sparganium minimum Fries.
Lilæa subulata H. & P.
Agropyron biflorum (Brign.) R. & S.
Agropyron inerme (S. & S.) Rydb.
Agropyron tenerum Vasey.
Agrostis hyemalis (Walt.) B.S.P.
Briza media L.
Calamagrostis langsdorfii (Link.) Trin.
Danthonia californica Bol.
Danthonia intermedia Vasey.
Echinochloa crusgalli (L.) Nash.
Festuca idahœnse Elmer.
Glyceria nervata Trin.
Hierochlœ odorata (L.) Wahlenb.
Kœleria cristata (L.) Pers.
Melica bella Piper.
Melica hartfordii Bol.
Melica subulata (Griseb.) Scrib.
Oryzopsis hymenoides R. & S.
Panicum occidentale Scrib.
Carex œnea Fernald.
Carex deweyana var. *bolanderi* Boot.
Carex exsiccata Bailey.
Carex feta Bailey.
Carex flava L.
Carex lasiocarpa Ehrh.
Carex leersii Willd.
Carex phœocephala Piper.
Carex preslii Steud.
Carex pyrenaica Wahl.
Carex sitchensis Bong.
Eleocharis obtusa (Willd.) Schultes.
Juncus mertensianus Bong.
Juncus oreganus Wats.
Juncus subtriflorus Coville.
Luzula piperi (Cov.).

Allium cernuum Roth., form *alba*.
Allium crenulatum Wiegand.
Asparagus officinalis L.
Disporum smithii (Hook.) Piper.
Erythronium grandiflorum Pursh.
Sisyrinchium segetum Bicknell.
Salix hookeriana Barr, var. *laurifolia*.
Salix mackenziana Barr.
Betula papyrifera Marsh.
Alnus oregana Nutt.
Alnus sitchensis (Regel.) Sarg.
Corylus rostrata Ait.
Eriogonum subalpinum Greene.
Polygonum douglasii Greene.
Polygonum nuttallii Small.
Arenaria verna L.
Montia chamissoi (Led.) Dur. & Jack.
Coptis asplenifolia Salisb.
Platystigma oreganum (Nutt.) Benth. & Hook.
Corydalis scouleri Hook.
Subularia aquatica L.
Athysanus pusillus Greene.
Thysanocarpus curvipes Hook.
Drosera anglica Huds.
Leptarrhena amplexifolia (Sternb.) Ser.
Mitella caulescens Nutt.
Parnassia fimbriata Banks.
Saxifraga delicatula Rydb.
Saxifraga emarginata Small.
Saxifraga saximontana E. Nels.
Ribes laxiflorum Pursh.
Aruncus sylvester Kost.
Sanguisorba microcephala Presl.
Spiræa menziesii Presl., form *alba*.
Lathyrus palustris L.
Trifolium arvense L.
Vicia cracca L.
Lythrum salicaria L.
Ludvigia palustris Ell.
Myriophyllum verticillatum L.
Sanicula septentrionalis Greene.
Hypopytes.
Hypopytes.
Newberrya congesta Torr.
Vaccinium sp. deliciosum Piper.
Dodecatheon puberulum (Nutt.) Piper.
Apocynum cannabinum L.
Gilia capitata Dougl.
Myosotis ? scorpioides L.
Prunella vulgaris L., form *alba*.
Prunella vulgaris var. lanceolata form *erubescens* Fernald.
Scutellaria lateriflora L.
Solanum nigrum L.
Chelone nemorosa Dougl.
Gratiola virginiana L.
Gratiola ebracteata Benth.
Orthocarpus castilleoides Benth.
Pedicularis ornithoryncha Benth.
Boschniakia strobiliacea Gray.
Plantago major var. *minimum* Dene.
Galium trifidum L., var. *subbiflorum* Wieg.
Valerianella macrocera T. & G., a form.
Lobelia dortmanna L.
Madia glomerata Hook.
Petasites frigida (L.) Fries.
Senecio fastigiatus macounii (Greene.) Greenman.

A number of named and identified specimens of plants collected in Alaska and the islands of the Behring Sea have also been donated by Mr. J. M. Macoun, of Ottawa; these plants are a most valuable acquisition for reference and comparison with any collection made in the northern areas of this Province.

While the collection in the Herbarium is steadily growing, it is as yet far from representative of the flora of British Columbia; there are still several large areas of the Province not represented, and much new material may be looked for in the northern and north-eastern fields, and especially on portions of the mountain ranges on the west coast of Vancouver Island, where a number of plants known to occur on the Olympic Mountains, in Washington, and unknown to us, may appear.

The increase of introduced plants around our cities and railways is largely in evidence; many of these, being noxious weeds, can hardly be looked upon as a beneficial exchange for our native flora which is fast disappearing from these settled areas.

THE WORKMEN'S COMPENSATION BOARD,

VANCOUVER, B.C., March, 1919.

The Honourable John Oliver, Premier,

Parliament Buildings, Victoria, B.C.

DEAR SIR,—In pursuance of section 50 of the "Workmen's Compensation Act" we enclose herewith Annual Report.

We are,

Yours very truly,

E. S. H. WINN,

Chairman.

To His Honour Sir FRANK STILLMAN BARNARD, K.C.M.G.,
Lieutenant-Governor of the Province of British Columbia.

MAY IT PLEASE YOUR HONOUR:

The Second Annual Report of the Workmen's Compensation Board of this Province is herewith respectfully submitted.

JOHN OLIVER,
Premier.

Premier's Office,
March, 1919.

REPORT OF WORKMEN'S COMPENSATION BOARD.

To the Lieutenant-Governor in Council,
Victoria, B.C.

SIR,—In accordance with the requirements of the "Workmen's Compensation Act," the following report is made. It will be divided into five parts:—

(*a.*) Financial—Assessments and Audits:
(*b.*) Claims:
(*c.*) Medical Division:
(*d.*) Accident-prevention.
(*e.*) Statistical.

(*a.*) FINANCIAL—ASSESSMENTS AND AUDITS.

All moneys paid as compensation, together with the cost of administration, are obtained by means of assessments collected from employers operating industries covered by the Act. These collections are based upon a certain percentage of the employer's pay-roll, the amount of the percentage being dependable upon the hazard of the particular industry. This percentage is known as the basic rate. This rating, however, must not be taken as indicating the true cost to the employer, for the reason that if the accidents to be paid for do not require the full amount of the basic rate, a portion only is called up.

As indicated in the statement of the condition of the classes on December 31st, 1918, the industries of the Province are grouped into a number of separate and self-sustaining classes. The industries listed in each class are, for the most part, of a somewhat similar character, either as to the nature of the work or as to the similarity of its hazards. Where two or more different kinds of industry are listed in the same class, the basic rates of assessment are in proportion to the estimated relative hazards in each industry included in the class.

Assessments are made upon the employers in each several class during each year, whenever the funds of the class in which the industry is listed require to be replenished an account of accidents which have occurred in the work of their class. In other words, assessments are not made until more funds are required.

Assessments at the basic rate for each kind of industry are based upon one-quarter of each employer's estimated annual pay-roll, and at the close of the year the true amount due from each employer is adjusted at the basic rate on as many quarters of his actual pay-roll for the year as assessments are required to be made during the year.

During the first year, in only one of the classes—namely, in Class 3—was it necessary to assess the basic rate on the entire pay-roll. In Classes 2 and 9 the basic rate was assessed on three-quarters of the pay-roll. In eight classes the basic rate was assessed on only one-half of the actual pay-roll for the year.

During the second year it was not necessary to assess the basic rate on the entire pay-roll of employers of any of the classes. In only two classes was it necessary to assess the basic rate on as much as three-quarters of the actual pay-roll, and in eight of the classes the basic rate was assessed on only one-half of the actual pay-roll for the year. In five of the classes it was found sufficient to assess the basic rate on only one-quarter of the actual pay-roll during the second year; for example, take an industry with a basic rate of 2 per cent., if but one assessment were made throughout the year the cost to that industry on its pay-roll would be one-quarter of 2 per cent., or 0.50 per cent.; if two assessments, the cost would be two-quarters of 2 per cent., or 1 per cent.

The effect of class division is that all industries in that particular class carry only the losses which occur in that class. By way of example, take the disaster which happened in No. 1 Mine of the Western Fuel Company, a company engaged in the coal-mining industry, wherein sixteen lives were lost. This company is in Class 3; the cost therefore, of that disaster is charged to Class 3 alone. No other industry placed in any other class in any way contributed to that loss; in other words, each firm in a particular class bears only its proportion of the loss in the class in which it is placed. If, however, accidents are reduced in number and severity, there is automatically a lessening of the drain on the funds of that particular class.

The question of the basic rate and its relation to cost is fully dealt with in the First Annual Report.

PENALTIES.

After the Act had been in force practically two years it was felt that employers generally had a pretty thorough understanding of its requirements; it was noted that while the large majority of the employers promptly paid their assessments, a number did not do so, the effect of which was that those who promptly paid were providing the funds to carry the accidents for all employers, while those who did not were getting the benefit of the moneys of those who had. It was therefore quite apparent that to permit this condition to continue would be unfair to those who promptly paid. For the purpose, therefore, of treating all equitably it was decided that on and after January 1st, 1919, the penalties permitted by the Act would be imposed.

Upon those failing to pay assessments within one month after the date of the assessment there is imposed a penalty of 5 per cent. of the amount unpaid on the assessment, and for each succeeding month or fraction thereof after the first month of default a penalty of 1 per cent. would be payable; in other words, default for a month or fraction thereof costs 5 per cent. of the amount unpaid, and for each month or fraction of a month thereafter an additional 1 per cent. of the amount unpaid.

Failure to pay medical-aid deductions within one month after their due dates—namely, the first days of the months of April, July, October, and January—incurs a like penalty.

The moneys received from these penalties are credited to the class in which the employer is at the time of its levy, save in the case of penalties on medical aid, in which case the penalties when collected are credited to the Medical Aid Department.

NEW CLASSES.

For the year 1918 the following new classes were created:—

Class 13: All Government employees not engaged exclusively in clerical work.

Class 14: All municipalities.

Class 15: All those engaged in fishing and packing of fish, fish or oil fertilizer, and oyster-cultivation.

Class 16 includes all those industries engaged in the manufacture of explosives, fuses, fireworks, and chemicals.

The following classes of labour not included in a named industry were extended the benefits of the Act: All school mechanics, those engaged in power-laundries not operated for a profit, and all engineers in steam-heating plants where the engineers operating are required to have a certificate or permit.

Throughout the year a number of employers not engaged in industries covered by the Act have applied to have the benefits of the Act extended to their employees. These applications were granted.

The statement of the condition of the Accident Fund on December 31st, 1918, shows the total receipts and disbursements of the Board during the first two-year period of the operation of the Act.

The average of the experience of the first two years affords a better basis for estimating the normal volume of business under the Act than would the figures for the first year. Many claims for injuries which happened during the last few months of the first year were not filed or could not be finally adjusted until the second year, and there could, of course, be no overlap of claims or serious development of injuries into the beginning of the first year from any previous period. For a similar reason the payments to the Board by employers during the second was greater than during the first year, as the true amount due in adjustment of the first year's assessment could not be ascertained and paid until their pay-rolls were audited after the close of the year.

While the volume of business during the second year was, therefore, considerably larger than during the first year, the cost to the employers for the respective years and the cost of administration did not show any material increase.

At the starting of the operations it was anticipated by the most sanguine of the supporters of this Act, and who had given the matter much thought, that by reason of the varied classes of industries and their location, some in remote parts of the Province, that the cost of transpor-

tation and the loss of time consumed in going between the different points, the cost of supplies, the increased payment of staff, that the cost to the employers would be at the best between 12 and 14 per cent. of the amount paid in by the employers for compensation.

The possibility of a high cost of operation was one of the chief objections to the measure. Two years' operation at a cost of 4.83 per cent. of the amount collected from the employer is, we believe, a sufficient answer to this objection.

The hearty co-operation which has been given by workmen, employers, and physicians, and their greater familiarity with the requirements upon them under the Act, has much facilitated the operation of every department of the work of the Board. Longer experience and a more highly perfected organization has resulted in a marked growth of efficiency of the entire staff, both in the office and in the field.

Field Auditors of the Board have visited the plants of employers in practically all parts of the Province, and as nearly as possible the pay-rolls of all employers within the application of the Act have been audited at least twice in each year.

Of every $100 collected from employers, $95.16 is used directly for the relief of injured workmen and their dependents, without any expense whatever to them, and this is only possible by reason of the Act providing for the administration of the Accident Fund by a Board appointed for the purpose, and to the exclusion of all intermediaries who might otherwise desire to make a profit out of the misery and distress of workmen injured in industrial accidents.

A reserve has been set aside and invested in Government and Victory bonds at a rate to earn 6.064 per cent., and in an amount equalling the present value of all pensions due dependents of workmen who have been killed in industry since the taking effect of the Act, and of all pensions or deferred payments due workmen who have suffered permanent partial disabilities in cases where such disabilities were not paid for in lump sums. The present value of all such pensions and deferred payments at the time the awards were made amounted to $847,024.14, of which $608,937.96 was on account of pensions payable to dependents of workmen who had been killed, and $138,086.18 on account of pensions payable for permanent partial disabilities.

Each item of reserve was figured in an amount which, earning interest at 5 per cent. and drained by the pension, would be exhausted at the end of the expectancy, to death or remarriage of the widow, or at the end of the term of any pension payable for a stated period of time.

The proceeds of 1 cent per day payable by workmen under the medical-aid provisions of the Act have gone far toward paying the expenses of physicians' treatment and hospital care in cases of accident. As expected, however, when the Act was passed, the proceeds were not quite sufficient, and it was necessary under the provision of section 30 (2) for employers, who did not have hospital arrangements with their men, approved by the Board, under section 21 (4), to make good the difference between the amount contributed by the workmen and the cost of the medical-aid service.

Two years does not afford sufficient experience to develop the true relation between the cost of physicians' treatment and hospital care to the proceeds of 1 cent per day from workmen. A number of the larger employers in the more hazardous industries, as in mining and lumbering, have approved hospital arrangements with their men, and no medical-aid charges are payable by the Board on account of any accidents which happen to such workmen.

INVESTMENTS.

During the year 1918 the Board made the following investments: $50,000 worth of Victory Loan bonds bearing interest at 5½ per cent., and $500,000 worth of British Columbia Government bonds which will net the Board 6⅛ per cent.

MERIT RATING.

It is confidently hoped that at the end of 1919 the Board may have sufficient definite statistical information as to warrant the bringing into effect of the merit-rating system as outlined in the First Annual Report, the effect of which is that those employers who by installation of safeguards and general accident-prevention measures have a record of cost less than the assessments paid will be given certain merit credits, whereas those whose accidents have cost more than their paid assessments will have a demerit differential created. Different systems of merit rating are now in effect in other places, but are still in their experimental stage. The Board has not yet decided upon any definite system, but those now in effect will be carefully investigated.

STATEMENT OF THE CONDITION OF THE SEVERAL CLASS FUNDS ON DECEMBER 31ST, 1918, COVERING FIRST TWO-YEAR PERIOD OF APPLICATION OF ACT, 1917-18.

Class.	Industries.	Received from Employers.	Refunds.	Amount paid.	Reserve, Present Value of Pensions.	Balance in Class Funds.	Rates of Assessments, Proportion of Basic Rates assessed.	
							1917.	1918.
1	Lumbering, sawmills, shingle and lath mills, pulp and paper mills, creosoting works, and logging-railways	$509,716 23	$1,176 99	$334,700 91	$173,393 44	$ 444 89	2/4	3/4

STATEMENT SHOWING CONDITION OF MEDICAL AID FUND ON DECEMBER 31ST, 1918, COVERING 1917 AND 1918.

Medical aid paid by workmen at 1 cent per day	$270,075 95
Share contributed by employers	69,851 96
	$339,927 91
Physicians, hospital, transportation, drugs, artificial members, etc.	$331,653 07
Balance on hand, December 31st, 1918	8,274 84
	$339,927 91

(*b.*) CLAIMS.

The moving of the head office of the Board from Victoria to Vancouver early in the year 1918 was found to be a distinct advantage in the Claims Department, in that, being close to the large industrial operations, and in the line of travel for workmen and employers to and from all parts of the Province, a great deal of time in correspondence was saved. Further, it was very convenient to be able to deal personally with a large number of claimants.

With the experience gained in 1917, various improvements were made in the methods of adjusting claims, with a view to shortening the time necessary to make payment to the injured workmen. Additional methods were found an advantage in the speedy adjustment of claims

in necessitous cases, and the numerous letters of appreciation received from workmen whose claims had been quickly dealt with were a gratifying feature of the year's work.

During the year 1918 a total of 22,498 claims were received. This figure represents actual claims made upon the Board either for compensation or medical aid. It does not include about 4,000 minor accidents, in which the workman did not require to lay off at all and required no medical attention other than first aid rendered him; he therefore had no claim whatever under the Act. Of the total number of claims received, 22,258 were non-fatal accidents and 240 claims were fatal. During the year 8,841 claims were adjusted and made final. Some of these claims were adjusted in several monthly payments; others required quite a number of adjustments.

The average number of claims per month was 1,875. The number of unfinished claims on hand at the end of the year was 1,493, so that it will be seen that the work of the Claims Department was kept up to date. This fact is emphasized when it is considered that included in the number of unfinished claims were over 300 on which monthly payments are being made, and some of which have extended over many months, the rest of the number being new claims received within the month. As the number on hand at the end of the year was less than the average number received per month during the year, it proves that they are adjusted in whole or in part within the month. In fact, all claims are adjusted generally within five to seven days of the date on which the last report is received or the file is complete. If, therefore, an injured workman finds delay in receiving compensation, he should see to it that the doctor's progress or final report has been sent in, and if a reasonable time has elapsed since the date on which it was sent the attention of the Board should be called to the claim. Letters regarding claims receive special attention.

In this connection it may be stated that one of the most frequent causes of delay in adjustment is the workman's failure to make application for compensation. The honours for sending in first report of the accident are now about evenly divided between the employers and the doctors. It frequently happens that workmen do not trouble to send an application for compensation for some considerable time, even though they are written to by the Claims Department from one to three times and the form enclosed on which to make application. Some workmen appear to regard the compensation due to them like money in the bank, to be called for at a later date when desired. Claims on which the workman has made no application are held in suspense for one year, the workman having the right to apply within that time.

At the end of 1918 there were 883 claims in suspense. These were composed of claims in which the workmen had lost from four to ten days and had not troubled to make application for compensation, and cases where no evidence of disability had been forthcoming.

Another very frequent cause of delay in adjustment is the failure of the workman to comply with the first requisite of the Act—namely, that of notifying his employers in writing as soon as possible after the accident. It is well that an application should be made to the Board promptly if the injury is such as will disable him for more than three days.

During the year 12,631 claims were received in which the workman had not lost more than three days, and was therefore not entitled to compensation for the time lost. Medical aid, however, was allowed in these cases.

There were 403 applications for compensation which the Board could not allow, fifty-nine of which accidents did not arise out of and in the course of employment; for example, old herniæ, stepping off street-car on way to work, knocked down by automobile after leaving employer's premises, kicked by horse on way to work and not on employer's premises, etc. In 288 of these cases the applicant's disability was not the result of accident; for example, a very large number suffering from influenza, rheumatism, typhoid fever, tonsilitis, eye-strain, tuberculosis, diphtheria, venereal diseases, etc. Sixteen cases were employers who had not applied to have the benefits of the Act extended to them; in thirty cases workmen engaged in occupations which were not covered by the Act—for example, school-teaching, farmers, domestic help, etc.; four were for minor injuries attributable to serious and wilful misconduct of workmen; in two cases the accident happened outside of the Province where the workmen were neither resident nor employed within the Province; four cases were accidents which happened prior to the Act coming into effect.

No matter how wide the scope of the Act, there will always be cases that are outside the scope, and these will continue to be a source of much thought to the Board and more or less dissatisfaction among the injured parties.

From time to time the Board has received inquiries as to whether certain cases are included within the scope of the Act. They have taken the position, however, that they cannot give a decision upon a one-sided statement of a case, and that it is necessary that a claim should be filed with the Board and evidence submitted by all parties before it can be judged. This in itself accounts for quite a few of the number of claims not allowed. The validity of some of the claims was questioned even by the workmen themselves before they were submitted to the Board.

It should be borne in mind that the Act is a limited form of insurance—namely, to personal injury by accident arising out of and in the course of employment; that it does not cover all the ills to which the flesh is heir; and that there are certain disabilities which, although they may incidentally come upon the workman at the time he is engaged in ordinary occupation, are not at all due to accident, and therefore not included within the scope of the Act. The broadest possible interpretation has been given the term "personal injury by accident" consistent with fair dealing to all parties affected.

As an example of the limitations of the Act, it may be mentioned that during the severe epidemic of Spanish influenza in the fall of 1918, many inquiries, telephonic and otherwise, were made as to whether the influenza was covered by the Act, some of the inquirers claiming that it was due to their daily work. There could, of course, be only one answer to these inquiries, that the influenza, though a great misfortune, could not by any stretch of imagination be considered as an accident arising out of employment. Then, again, claims were made for such ailments as typhoid fever, scarlet fever, shingles, etc., none of which can be classed under personal injury by accident.

A total of 240 fatal accidents was reported during the year; 116 pension awards were made and many more have been allowed since the close of the year.

It is believed that had there been a little more care exercised on the part of both the employer and employee a number of these fatal accidents need not have happened. The Board has the Government's assurance that all deaths in industry caused by accident will be investigated by a Coroner's jury or some other means of searching inquiry.

Of the claims which were finally disposed of during the first two years, 456 resulted in permanent partial disability to workmen.

As shown in the statistical tables, a distressingly large number of these permanent partial disabilities were of a very serious nature—eighteen workmen each lost an arm by amputation and fifteen arms were seriously impaired; sixteen workmen each lost a leg and twenty-eight suffered permanent leg impairment; forty-six each lost the sight of an eye, and fifteen more sustained serious and permanent impairment of vision. A large number of injuries to the hand resulted in loss of one or more fingers. The greater number of these resulted from accidents in shingle-mills, but a strict enforcement of the safety regulations adopted by the Board as to the installation of safety devices has resulted in a very gratifying and marked decrease in accidents of this character.

A surprising number of workmen who met with injuries resulting in the loss of one or more fingers, or even such more serious losses as the loss of an eye, are found, within a short time after returning to work, to earn as much after accident as they did before they were injured.

In such cases, however, the Board has recognized that there has in fact been an impairment of true earning capacity, although the evidence in actual loss of wages may not yet have developed. Instead of requiring such injured workmen to report to the Board regularly for an indefinite period and making proof that any loss of wage they may have suffered was strictly on account of their physical impairment, the practice of the Board has been to estimate the probable future loss of wage which will be sustained on account of the disability during the remainder of the life of the workman, and to make final settlement at 55 per cent. of such estimated impairment of earning capacity.

Each case of permanent partial disability is carefully considered, and whenever practicable the injured man is examined by the Board, and the manner of the settlement is such as may appear to be in the best interest of each individual; except in the case of minor disabilities the awards are rarely paid in full by lump sums, but a portion of the award is paid in cash and the remainder is either paid in a life pension or in deferred payments, extending over the period during which the actual impairment of earning capacity will probably continue, and until the workman is expected to have become adapted to his disability.

In the event of an award not being satisfactory to either the employer, the workman, or his physician, a rehearing is granted, and thereupon all parties affected have an opportunity of introducing such evidence as they may feel will give the Board their view-point and possibly obtain a different decision. There have not been as many rehearings this year as in 1917. This is due, we believe, to the fact that the Act and its limitations are now better understood.

PERMANENT PARTIAL DISABILITIES.

The following cases, among others, will serve to illustrate the method adopted in dealing with permanent partial disabilities:—

Claim No. 5543.—Workman, age 54, whose right hand was seriously impaired while felling a tree. Total disability in this case continued for thirty-two weeks before claimant was able to perform lighter work. During this time compensation for 55 per cent. of lost wages and all charges for surgical treatment and hospital care were paid. It was found on questioning the workman that he had previous farming experience, and he himself felt that if a sufficient sum were advanced to him to permit him to purchase a small piece of land he would be able to make a comfortable living thereon. A sufficient sum to purchase land, as well as to stock same, was thereupon paid him. He is now engaged in raising pigs and chickens and doing small farming, and reports after a year's experience that he is doing particularly well. Fifty-five per cent. of his estmated future loss of wages were commuted into a lump sum for the purchase aforesaid.

Claim No. 7037.—Workman, age 31, whose leg had to be amputated below the knee on account of accident while employed as rigging-slinger in a logging camp. Claimant was paid compensation for thirty-three weeks and was provided with an artificial leg. Before securing employment in the woods he had earned his living by fishing. He felt that he was no longer able to work in the woods, but that if he could be paid a sufficient amount to purchase a suitable power-launch he would find no difficulty in earning a good living in the fishing industry. A satisfactory launch was purchased and a sufficient portion of his life pension was commuted for the purpose. The workman reports excellent results from such purchase.

Claim No. 4679.—Workman, age 61, whose right arm is permanently impaired as a result of scratching one of his fingers with rusty wire while employed as a longshoreman. The injury was followed by a severe attack of blood-poisoning involving the bones of the arm. His wife having had farming experience, a sufficient sum in cash was paid to enable him to buy 4 acres of well-located good land and engage in market-gardening and raising chickens. A pension of $20 per month will also be paid him for a term of years.

Claim No. 7031.—Workman, age 58, lost leg at knee as a result of a runaway while employed as a teamster. Claimant was found to have a farm, and with sufficient assistance to purchase a team of horses and wagon and other supplies he could operate it successfully, as he had become accustomed to the use of his artificial leg. He was therefore paid a sum sufficient for the purpose, and will receive a pension of $20 per month for several years.

Claim No. 2225.—Workman, age 34, the muscles of whose left arm were impaired in an accident in a mine, was given a course for a number of months in a business college, in order that he might successfully follow clerical work, and the amount of the life pension was modified accordingly.

Claim No. 17595.—Boy, age 16, who lost portions of four fingers of his right hand in a printing-machine. After consultation with his parents as to which line of instruction would be most advisable in view of the partial disability of his hand, arrangements were made for him to take a course in telegraphy, and the tuition charges will be paid in addition to payment of a monthly pension for a considerable period.

Claim No. 7125.—Boy, age 15. In this case portions of four fingers of his left hand were cut off while he was operating a rip-saw. As soon as it is determined what line of technical training will be most advisable, arrangements will be made for a suitable course of instruction.

Claim No. 20452.—Workman, age 28, lost his left arm above the elbow by being caught in the belting in a printing-office. In order that he might be qualified as an accountant, he was paid a sufficient sum in cash to maintain his family while he took such a course. It is believed that on the completion of his course he will be enabled to earn a good salary as an accountant.

With the exception of the last three mentioned cases, a committee of the unions to which the injured workmen belonged were consulted, and upon the workmen and the committees being satisfied the above arrangements were carried out. It is believed that the handling of the permanent-disability cases in this way will reasonably ensure the success of the workman's

future. The Board does not enter into these negotiations unless they are fully satisfied that the workman has had sufficient experience to make a success of the work in which he desires to engage.

Eight Chinese suffered serious permanent partial disabilities, six having lost the use of an arm or hand, either wholly or in part, and two having lost an arm. It was arranged at their request that they return to China, and on production of steamship tickets and completion of their identification and passport arrangements they were each given sufficient cash for present needs, and further payments due on their award will be paid to them in China.

Two Italians, one of whom lost an arm and the other sustained serious injury to his hand, were returned, in accordance with their own desires, to Italy, and after arrangements had been made for their transportation and passports they were given a part of their award in cash and received the balance in Italy.

Re-employment.

During the past year an earnest effort was made by the Board to find the injured workman new employment where he was unable to return to the same employment at which he was injured. In this effort the Board succeeded, with the co-operation of the workmen and employers, in finding new positions for practically all so injured.

Re "Sophia" Disaster.

On or about October 25th, 1918, the Steamship "Princess Sophia," a boat owned and operated by the Canadian Pacific Railway Company, struck a reef in Alaskan waters and went down with a crew of sixty-one, all of whom were lost. This was the most shocking catastrophe of the year. Upon the confirmation of this loss this Department immediately required the owners to report this accident in accordance with the Act's requirements. The owners thereupon notified the Board that they proposed to contest the validity of section 8 and other sections of the Act relating to this particular class of accident, taking the position that those sections were beyond the legislative authority of the Provincial Legislature. Negotiations were immediately entered into between the Board and the company to the end that there be a final and early termination of the dispute. Inasmuch as the validity of certain sections of the Act was in question, and having regard to the fact that there were a large number of dependents, some of whom required immediate assistance, and as there were difficult constitutional questions at stake, the Board appealed to the Government to appoint the best available legal assistance to push through to a speedy and successful termination the points in dispute. The Government thereupon appointed Mr. S. S. Taylor, K.C., as counsel to take charge of the matter on behalf of the Board. Action has been commenced by the company against the Board, as well as the individual members thereof. The plaintiff in the statement of claim asks for a declaration:—

"(1.) That sections 8, 9, and 12 of the 'Workmen's Compensation Act' are beyond the power of the Legislature of the Province of British Columbia to enact:

"(2.) Alternately, that the Workmen's Compensation Board is bound by and obliged to observe Part 8 of the 'Merchants Shipping Act, 1894,' or the 'Canada Shipping Act,' whichever is applicable, in respect of the payment of compensation to the said dependents:

"(3.) Alternately, that the 'Workmen's Compensation Act' is repugnant to or unworkable with Part 8 of the 'Merchants Shipping Act, 1894,' or said sections of the 'Canada Shipping Act,' whichever is applicable, in respect of the payment of compensation to the said dependents, and is therefore invalid and void:

"(4.) For an injunction enjoining the defendants and every of them from paying compensation to dependents of the crew of the 'Princess Sophia' or any of them."

The trial of the action will be held on March 10th, 1919. It is anticipated that the constitutionality of these sections of the Act will not be finally disposed of until the Privy Council hands down the final judgment, which, it is hoped, will not be later than July, 1919. In the meantime and until restrained by the Court the Board will continue to pay all those whose claims have been allowed.

Re Protection Shaft, No. 1 Mine, Nanaimo.

Another startling disaster was that which happened on September 10th, 1918, in No. 1 Mine, a property owned and operated by the Western Fuel Company at Nanaimo, whereby sixteen workmen lost their lives by the breaking of the cable between the cage and the hoisting-drum.

There was a wide difference of opinion as to what caused this breaking. In order to definitely ascertain all that could be learned on this point, the Mines Department had portions of the cable sent East to the McGill University Testing Department, supposedly the most efficient in Canada, for test. The findings of the McGill authorities were made known to the Coroner's jury, with the result that they found that there was insufficient internal lubrication, which permitted the oxidizing of the wires.

Before this report is published it is hoped that satisfactory mining legislation will have been introduced and passed as will ensure more thorough inspection, better methods of oiling, and a definite time-limit during which a cable may be used for the hoisting of workmen.

(*c.*) MEDICAL DIVISION.

The medical aid provided under the Act entitles injured workmen to all medical, surgical, hospital treatment, transportation, nursing, medicines, crutches, and apparatus, including artificial members, as are necessary at the time of the injury and thereafter during disability to relieve from the effects of the injury. It will therefore be seen that this is one of the most important departments created by the Act. Before a claim can receive consideration it must have passed through this department. All medical, hospital, nursing, drugs, dental, artificial members, apparatus, and transportation accounts have to be considered. It is believed that, in the 22,498 cases handled, approximately 75,000 medical reports and approximately 50,000 accounts were passed in connection with the past year's work.

Progress has been made in adopting various methods of reducing the number of infections which in many cases resulted seriously. In some instances slight injuries were neglected, as no first-aid treatment was given and infection was the result. It is estimated that slightly over 7 per cent. of the cases reported eventually show infection, and to overcome this, and to a reasonable extent eliminate this serious condition, the following first-aid service requirements were brought into effect at the first of this year:—

FIRST-AID SERVICE.

(1.) Every employer having more than ten and less than fifty workmen usually employed shall provide and maintain in his factory or place of employment, or in each factory or place of employment if he has more than one, a first-aid kit or box containing the following supplies, with such additional quantities as may be reasonably necessary to provide first aid to his injured workmen, and same shall be available during all working-hours without cost to them. The said kit or box shall be in charge of some suitable person.

MINIMUM FIRST-AID KIT.

A standard First-aid Manual.

Instruments.

1 pair scissors
1 pair fine tweezers.
2 eye-droppers.
1 camel's-hair brush.
1 white-enamel wash-basin.

Drugs.

2 oz. 4 per cent. boracic acid, for eye-wash.
1 (2 oz.) bottle of boracic tablets.
2 oz. alcoholic iodine, half-strength (for external use).
1 bottle, 100 tablets, bichloride of mercury.
1 (8 oz.) bottle saturated solution picric acid.
1 (8 oz.) bottle 10 per cent. Balsam-Peru in castor-oil.

Each of the above must be in bottles or containers, plainly labelled, and the specific purpose for which the contents are to be used marked thereon.

Dressings.

6 (1 oz.) packages absorbent cotton.
3 1-yard packages plain sterile gauze.
12 sterile gauze bandages (assorted sizes).
2 rolls (1 inch by 1 yard) adhesive plaster.
6 splints (assorted sizes).
2 packages raw cotton (padding for splints).

(2.) Every employer having more than fifty and less than 200 workmen usually employed shall provide and maintain in his factory or place of employment, or in each factory or place of employment if he has more than one, a first-aid kit or box containing the following supplies, with such additional quantities as may be reasonably necessary to provide first aid to his injured workmen, and same shall be available to workmen during all working-hours without cost to them. The said kit or box shall be in charge of some suitable person.

MEDIUM FIRST-AID KIT.

A standard First-aid Manual.
1 carrying-stretcher.

Instruments.

1 pair scissors.
1 pair fine tweezers.
2 eye-droppers.
1 camel's-hair brush.
2 doz. safety-pins (assorted).
1 tourniquet.
1 graduated medicine-glass.
1 porcelain or white-enamel wash-basin.

Drugs.

2 oz. 4 per cent boracic acid, for eye-wash.
2 oz. aromatic spirits of ammonia.
1 (2 oz.) bottle boracic tablets.
2 oz. alcoholic iodine, half-strength (for external use).
1 tube carbolized vaseline.
1 (8 oz.) bottle 10 per cent. Balsam-Peru in castor-oil.
1 bottle, 100 tablets, bichloride of mercury.
1 (8 oz.) bottle saturated solution picric acid.

Each of the above must be in bottles or containers, plainly labelled, and the specific purpose for which the contents are to be used marked thereon.

Dressings.

6 (1 oz.) packages absorbent cotton.
3 1-yard packages plain sterile gauze.
12 sterile gauze bandages (assorted sizes).
3 triangular bandages.
1 roll adhesive plaster (1 inch by 5 yards).
Light board material for splints.
6 assorted splints.
3 packages raw cotton (padding for splints).

(3.) Every employer having 200 or more workmen usually employed shall provide and maintain as convenient as possible to his factory or plant an emergency first-aid room, which shall be painted white and kept absolutely sanitary at all times. This room shall be kept in charge of a clerk, workman, nurse, or other person possessing a certificate of competency, to the satisfaction of this Board, to render first aid to the injured, and shall be provided with the following equipment and supplies in such quantities as may be reasonably necessary to provide first aid to the injured workmen during all working-hours without cost to them:—

FIRST-AID ROOM EQUIPMENT.

A standard First-aid Manual.

Furniture.

Hot and cold water.
1 porcelain or white-enamel wash-basin.
1 emergency operating-table.
1 sterilizer.
1 cabinet for surgical dressings.
1 porcelain or white-enamel foot-bath.
1 enamelled refuse-pail.
1 couch or bed.
1 carrying-stretcher.

A metal box or grip, fitted with emergency dressings, to be used by first-aid attendant when required to attend injured men in factory or place of employment who cannot be immediately removed to first-aid room

Instruments.

Scissors.
Dressing-forceps.
Eye-droppers.
Camel's-hair brushes.
Safety-pins (assorted).
2 steel probes.
1 silver forceps.
Tourniquet.
Graduated medicine-glass

Drugs.

Boracic acid, for eye-wash (4 per cent.).
Aromatic spirits of ammonia.
Boracic tablets.
Alcoholic iodine, half-strength (external use).
Carbolated vaseline.
Picric-acid solution.
Recognized antiseptic for washing wounds—e.g., bichloride of mercury.
Cresol.
Eusol (Dakin's solution) powder or tablet forms.
Burn-dressing—e.g., bicarbonate of soda mixed with vaseline (3 per cent.).

The above must be in bottles or containers, plainly labelled, and the specific purpose for which the contents are to be used marked thereon.

Dressings.

Absorbent cotton.
Sterile gauze.
Sterile gauze bandages (assorted sizes).
Cotton bandages (assorted sizes).
Triangular bandages.
Adhesive plaster.
Splints (assorted sizes).

(4.) Every employer employing twenty or more workmen in a place of employment situate more than five miles from the office of a medical practitioner shall at all times maintain in or about such place of employment one person possessing a certificate of competency to render first aid to the injured.

(5.) Every employer employing 100 or more workmen shall at all times have available for immediate use a satisfactory vehicle or other satisfactory means of transportation to convey all injured workmen to the nearest hospital.

(6.) Every employer employing fifty or more workmen at a place of employment more than five miles from a hospital shall provide a first-aid room and equipment in addition to the requirements mentioned in paragraph (2) herein.

(7.) Every employer shall provide immediate transportation to a hospital for all injured workmen in need of such transportation.

(8.) The foregoing requirements shall be supplied at the expense of the employer.

(9.) A minimum first-aid kit as above described, or first-aid equipment satisfactory to the Workmen's Compensation Board, shall accompany the crew in charge of every railway-train in transit and every vessel.

(10.) The Board may direct or approve of any addition to or reduction or variation in the first-aid service or appliances above described, or may in any case not above provided for prescribe such first-aid service and appliances as it deems warranted.

The number of injured workmen receiving the benefit of this medical-aid service are necessarily much greater than the number receiving lost-time compensation. All injured workmen are entitled to treatment. The Board has insisted on all workmen obtaining first-aid service, and when that is not sufficient that they go to a duly qualified medical practitioner registered under the "Medical Act." Very seldom is a claim now made by a workman who has not obtained such treatment. In the past the apparently insignificant cut or bruise was practically ignored, and the result generally was serious. The importance of antiseptic treatment of even slight wounds and for first aid in cases of emergency is now well recognized. Many thousands of dollars compensation that the Board's statistics show might have been saved by preventing blood-poisoning and other serious consequences is only a part of the benefit of such service. All employers in the Province are now required to have first-aid service outlined above. The efficiency of the service will necessarily depend much upon having it in charge of some person or persons who take an interest in the work, and who will therefore see that the equipment is correctly used and replenished when necessary. This interest should be cultivated among the employees in order that they may be able to make use of the service when the occasion does arise.

During the past two years the Board has allowed and paid for medical, surgical, hospital treatment, transportation, nursing, medicines, crutches, apparatus, artificial members, dental expense, etc., the sum of $331,653.07. It therefore can be readily seen what an important feature of the Act the medical service really is. The Board has adopted the practice that, in the event of a dispute between the Medical Referee and the physician attending the injured workman, the matter of that dispute be immediately referred to a medical man who occupies a leading position in the profession, or, in the event of there still being a doubt, the matter is invariably referred to a committee of three medical men for final decision. It is hoped by the adopting of this practice that the injured workmen as well as the attending physician will feel that every effort is being made to get the best medical opinion available.

The success of this work is due to a great extent to the energetic, enthusiastic, and hearty co-operation of practically all members of the medical profession. The feeling between the Board and the members of the profession has been most harmonious.

From a perusal of the files it would appear that one out of every twelve injuries that are suffered by the workmen where there is a three-days' time loss is a hospital case. Without exception all hospitals have most heartily co-operated with the Board, and to them also we wish to extend our appreciation.

(*d.*) ACCIDENT-PREVENTION.

Each accident prevented and each safeguard installed in an industrial establishment means not only reducing the drain on the funds, but also conserving and preserving man-power both to the Province and the nation.

COST OF INTERRUPTION AND REPLACEMENT.

The cost of interruption and replacement due to accidents is generally admitted. This is looked upon as an indefinite factor. There are many items which must enter into the establishment of definite figures, so necessarily there are many difficulties to be overcome before it can be expressed in terms of dollars and cents.

In the event of a fatal injury there is bound to be, first, a complete local paralysis of activity among the immediate workers of the injured workman. A number will naturally drop their work to lend him aid and will remain with him at least until he is delivered into the hands of the staff of the First-aid Department. After the removal of the injured workman from the scene of the accident there will be a continuance of the interruption to the regular work, during which time the witnesses of the accident will discuss it among themselves and with others who may be in the vicinity, but who did not witness it and who are very humanly interested in knowing something of the occurrence. There is also the interruption in the activities of a number of employees whose work causes them to be along the route followed in removing the injured workman to the First-aid Department or from the premises. This interruption will involve an

appreciable reduction in output among some who learn of there having been an accident only from those who have seen the injured workman while in the process of removal. Then, again, there is the workman or workmen who, by reason of being in a position of authority or responsibility, or both, will have to devote time to attending the injured workman, and later to learning something of the history of the accident. In a majority of cases, at least one fellow-workman will be detailed to accompany the injured workman, either to the hospital or his home.

Accidents which result in fatal or permanent injury or in compensable temporary injuries invariably make it necessary to replace the injured workman. There is thus involved the expense of breaking in a new man.

After giving consideration to those several items of interruption based on loss of time and to the prevailing wage, together with replacement cost, it seems entirely conservative to adopt, as some of the Boards do, the cost of interruption and replacement in a reasonably sized plant at the sum of $50 in the case of fatal injuries; the sum of $30 in permanent and serious temporary injuries; the sum of $10 in those temporary injuries which involve from one to five days' loss of time; and $5 in the case of "no time loss" injuries.

Statistics.

It is vitally important, therefore, that there be a systematic campaign of inspection of plants, depending upon the number of men employed. A portion of the work of inspection may be done by the heads of the department. A number of the larger plants in the Province consider it advisable to compile statistics covering all phases of the accident experience of the plant. These statistics showing the happening of accidents in the different portions of the plant are placed in prominent places about the plant, so that each department has an opportunity of comparing results. This work from an educational standpoint cannot fail to produce good results, as well as create a desire on the part of the different departments to establish the best record for the next month; therein the benefits of the educational work is shown.

Accident-prevention Regulations.

In the past year considerable progress has been made in organizing and conducting accident-prevention measures. Early in 1918 the following Safety Regulations were passed:—

General.

Transmission Machinery, Shafting, Couplings, Pulleys, Gearing, Belting, and Conveyors.

1. *Emergency Stopping Device.*—(Except with the consent of the Board.) Wherever there is power-driven machinery, a device shall be provided at a convenient point or points, in each department or work-room, whereby either the entire power-supply in that department or room may be cut off as a whole or the one or more lines of shafting used in driving counter-shafting or directly driving machines may be cut off independently.

2. *A Safety Placard* shall be prominently displayed, calling attention to the stopping device and method of operating same.

3. *All Safeguards* shall be well constructed and of the best material for the purpose and maintained in place.

4. *All Manufacturing Plants* shall have signal-cords connected with the bell or whistle, and located in convenient places on each floor.

5. *All Workmen* in a plant shall be taught how to make use of the system of signals by which all the machines can be stopped in case of accident.

6. *Oiling, Cleaning, and Repairs.*—Workmen shall not undertake to oil, inspect, clean, or repair machines in motion or moving parts of machinery unless previously authorized to do so by the foreman or overseer.

7. *Clothing.*—The clothing of employees having to work around moving parts of machinery, and particularly those whose duty it is to oil up and repair machines, shall be buttoned and close fitting.

8. *Gloves or Mittens* shall not be worn when handling belts when in motion, or working on machinery where they are liable to be caught in moving machinery.

9. *Handling Belts.*—No belt larger than 3 inches wide (except with the consent of the Board) shall be connected by hand unless it be slow-running. Slow-running belts shall be defined as those running less than 120 feet per minute.

10. *When a belt is not in Use* it shall be hung up in a place where it cannot be caught by pulleys or shafts.

11. *Horizontal Shafting.*—Any portion of a horizontal shaft which is 6 feet 6 inches or less from the floor or working-platform, or which may be approached while in motion, shall be guarded on the sides and bottom or protected by a standard railing ensuring at least 15 inches and not more than 20 inches horizontal clearance from the nearest moving part.

12. *Vertical Shafting.*—(Except with the consent of the Board.) Vertical or inclining transmission shafting shall be encased to a height of 6 feet from the floor.

13. *When a Shaft*, pulley, or belt passes through the floor (or any guard is placed around floor opening) a 6-inch solid section or toe-board shall be placed at the bottom of the guard, and a heavy top rail not less than 3½ feet high.

14. *Projecting Shaft Ends or Keys.*—All projecting shaft ends or keys shall be cut off or properly protected with stationary casing.

15. *Fly-wheels.*—All sections of fly-wheels with spokes which are 6 feet 6 inches or less from the floor and which are exposed to contact shall be guarded. Fly-wheels which run in pits shall be provided with handrail and toe-board around the pit.

Exception.—Where an engine is isolated in a room used exclusively as an engine-room, the fly-wheel of such engine may be guarded with a railing. This railing shall be constructed with two rails, the bottom of which shall not be less than 18 inches from the floor. Whenever main or auxiliary engines are located in a basement, they shall be completely railed or fenced off so that no unauthorized person can gain access thereto.

16. *Couplings and Collars, Keys and Set-screws.*—Shaft-couplings and set-collars shall be of a safety type, without projecting bolts, set-screws, or other dangerous projections, or be completely guarded.

17 *Clamp-couplings* shall be guarded by a cylindrical sleeve the full length of the coupling.

18. *Jaw-clutch Couplings* shall be provided with cylindrical sleeve which at least covers the jaws.

19. *Universal and Flexible Couplings* shall be so guarded or encased as to remove all hazards.

20. *Friction-clutch Couplings* shall have their operating mechanisms, where exposed, completely guarded.

21. *Keys* exposed to contact shall be made flush or guarded.

22. *Key-seats*, where exposed to contact, shall be guarded.

23. *Set-screws* or revolving parts shall be counter-sunk, or covered by a guard, or a headless set-screw shall be used. No part of the set-screw shall project above the surface.

24. *The Above Guards* shall be so designed, where practicable, as not to revolve with the part guarded.

25. *Friction-drives.*—The contact faces of all friction-drives, when exposed to contact, shall be enclosed.

26. *All Frictions* with projecting bolts shall be guarded.

27. *Bearings.*—Accurate alignment of bearings is an important factor in safety and in economy of operation. Frequent inspections of bearing and hangers are desirable. They should be so equipped with oiling apparatus that there will be no occasion for the oiler to come into dangerous proximity with shafting when it is in motion.

28. *Pulleys.*—Pulleys shall be placed at a slightly greater distance from bearings or hangers or other pulleys (except tight and loose pulleys) than the width of the belt, so that in case the belt slips off the pulley it will not become wedged between the hanger and the pulley or between the two pulleys, thus pulling down the line-shafting. If it is impracticable to space pulleys farther from a hanger or another pulley than the width of the belt, the intervening space shall be guarded in such a way that it will be impossible for the belting to become wedged should it slip the pulley. This may be done by placing a spool 4 inches larger in diameter than the pulley on the side of the pulley adjacent to a hanger or another pulley, or by use of a belt-hanger. Pulleys shall be frequently inspected for cracks which are likely to develop in the arms or rims. When a crack occurs a piece of the rim may be thrown out by centrifugal force and cause a serious accident. Testing by hammer will usually disclose any defects.

29. *Idler Pulleys or Tighteners* used to tighten belts on pulleys, if provided with counter-weights, shall have counter-weights guarded or enclosed.

30. *Belt-shifters.*—A permanent belt-shifter shall be provided for all loose pulleys, and shall be located within easy reach of the operator. The construction of belt-shifters shall be such as to make it impossible for the belt to creep back on to the tight pulley. All belt-shifters shall be equipped with a lock or some other device to prevent accidental shifting.

31. *Belts.*—All belts, ropes, or chain-driving machinery or shafting, and all secondary belts, ropes, or chains, where exposed to contact, shall be guarded. In all cases the point where the belt, rope, or chain runs on to the pulley sheave or sprocket, if within 6 feet 6 inches of the floor or platform, shall be guarded.

Exception.—Belts which are so small that they are not in any way a source of danger.

32. *All Horizontal Belts, Ropes, or Chains* driving machinery or shafting 6 feet 6 inches or less above the floor or platform, where exposed to contact, must be guarded. All overhead belts 6 inches or more in width and over 6 feet 6 inches from the floor or platform shall be guarded underneath and on sides, unless so guarded that persons cannot pass under them. All chains or rope-drives over 6 feet 6 inches from the floor or platform shall be guarded in like manner to belts over 6 inches in width In all cases the guard should cover the outer faces of the two pulleys or sheaves and extend upward to such a point and be attached in such a way that, in case the belt, chain, or rope breaks, the guard will withstand the whipping force.

33. *Vertical and Inclined Belts* shall be substantially guarded as follows: If the guard be less than 15 inches from the belt, there shall be a complete enclosure of wood or metal to a height of 6 feet, unless it is a small belt, then with the permission of the Board a small belt-guard need only be 3 feet 6 inches high. If the guard is placed at least 15 inches clearance from the belt, a two-rail railing at least 3½ feet shall be required.

34. *Belt-tighteners* which control the operation of machines shall be equipped with a safety lock or stop which will prevent the application of the tightener to its belt until the lock or stop is released.

35. *Transmission Gearing.*—In this term is included all forms of spur-gears, pinions, bevel-gears, mortise-wheels, and sprockets for chain-drives, etc. Such gearing, wherever located, shall be strongly and completely encased, or when this is impracticable shall have a band guard provided with side flanges extending inward beyond the root of the teeth. Where there is a spoke hazard the gears always shall be enclosed on exposed side.

36. *The Operation of Driven Pulleys* on line or counter-shafts which have no bearing between the pulley and the end of the shaft shall not be used unless guides be provided which will prevent the belt running off the pulley.

37. *Runways.*—If possible, overhead runways shall not be less than 20 inches in width and equipped with a handrail. If runway is less than 20 inches in width, then same shall have two handrails. Access to these runways shall be in all cases by means of fixed ladders or railed stairways.

38. *If a Passage or Runway* passes between the strands of a belt, a substantially covered way with railed sides or other adequate guard shall be provided.

39. *If a Passage or Runway* passes over a shaft or conveyor, a substantial covered way with sides shall be provided.

40. *Ladders.*—All movable ladders (except substantial step-ladders) shall be provided with either sharp points at the foot or wide rough surface feet or other effective means to prevent slipping. Ladders for use in oiling overhead shafting, where necessary to rest same on the shafting, shall be arranged to hook over the shafting. Ladders shall extend at least 2 feet above top of landing.

41. *Stairways and Handrails.*—All stairways shall be equipped with handrails, and the rails shall be kept smooth and free from nails and splinters.

42. *Where the Stairway* is not built next to a wall or partition, rails shall be provided for both sides.

43. *Floor Openings* shall not be allowed without guard-rails and toe-boards without written permission from the Board.

44 *Floor Platforms and Wharves*, etc., shall be kept in good repair and free from nails and other debris.

45. *Where* timber, lumber, slabs, rock, or refuse is dropped from mill floor to lower floor or ground, the space where it is dropped to shall have a railing so as to prevent any person from walking under said opening.

46. *Emery-wheels, Hoods, and Guards.*—Emery-wheels used for grinding purposes shall be equipped with a hood connected with an exhaust-fan or water system. A guard shall be provided as a part of the hood-construction or in addition to the hood, which shall be strong enough to withstand the shock of a bursting wheel. This guard shall be adjusted close to the wheel and extend over the top of the wheel at a point 30 degrees beyond a vertical line drawn through the centre of the wheel. The exhaust or water system is not required on emery-wheels which are in general use by all employees in common to touch up castings or tools.

47. *Arbor Ends* shall be guarded.

48. *Speed of Wheel* shall not exceed the speed guaranteed by the manufacturer or determined by the Inspector.

49 *Goggles* shall be supplied for workmen while working at emery-wheels, or the guard shall be equipped with an extension guard with steel frame and heavy glass to prevent sparks striking workmen in the eyes. Celluloid frame goggles shall not be used.

50. *Passage-ways and Platforms.*—Whenever it is possible, thoroughfares through basements shall be avoided. If not possible to avoid this altogether, any passage-way that may have to be used as a thoroughfare shall be properly protected and lighted.

51. *Tanks.*—The supports of all elevated tanks shall be accessible for the purpose of inspection. Every tank over 7 feet deep containing liquids shall have a fixed ladder both inside and out. Rungs shall have a clearance of at least 6 inches.

52. *Hogs and Grinders* shall be properly guarded, so that it is impossible for knots, chips, etc., to fly out and injure workmen.

53. *When it is necessary* for workmen to pass under bearings, said bearings shall be equipped with drip cups or pans securely fastened in position, so as to prevent oil from falling on floor.

54 *Where* iron or steel scrap is broken up with drop-weight, the said area shall be completely enclosed on sides 8 feet high, to prevent injury to workmen from flying pieces.

Scaffolds.

1. *Scaffolds* in particular shall receive the most careful attention as to strength and rigidity.

2. *All Scaffolds* shall be kept in the best of repair and all broken or rotten timbers or boards removed.

3. *The Piling* of excessive weights or concentrated loads which might cause collapse of the scaffold shall at all times be avoided. Where scaffolds are over 10 feet above the ground or floor, they shall, where practicable, be equipped with a railing and toe-boards or skirting-boards to prevent falling material. On suspended scaffolds, where practicable, it shall be necessary to use wire rope for slings and stirrups.

4. *Floor Openings* shall not be allowed without guard-rails and toe-boards, unless by permission of Inspector.

Cranes.

Safety Standard for Cranes.

Factor of Safety for all parts other than gears, and complete hoist mechanism, 5.

Factor of safety for brakes, 15.

Floorman to warn people out of the way.
Floorman or Hoistman to be provided with megaphone or gong.

SAWMILLS.

1. *Log-hauls.*—(*a.*) For chain-hauls the return strand of the chain in the basement shall be so supported over passage-ways that in the event of its breaking it cannot fall on any one beneath.

(*b.*) Unless clearly impracticable, every log-haul shall have at least one runway of sufficient width to enable a person to stand clear of logs in the chute.

(*c.*) Runway shall be equipped with handrail.

2. *Log-deck.*—Provisions shall be made at the mill end of the log-deck to afford substantial protection from rolling logs to the sawyer and other employees who may be engaged around the band or circular mill.

3. *Carriage.*—(*a.*) When a log-deck is equipped with a steam-operated nigger, carriage-knees shall be equipped with goose-necks or straight bar extending 18 inches or more above top of knee.

(*b.*) The seat or stand of the setter shall be fitted with an adequate protection to prevent his coming in contact with the wall timbers or rafters where the clearance between the back of the setter's seat and the wall timbers of the mill structure is less than 18 inches.

(*c.*) There shall be placed at each end of the carriage-travel a substantial buffer-stop, preferably equipped with spring or pneumatic buffers.

(*d.*) Means shall be provided for securely locking the sawyer's log-turning and carriage-control levers.

4. *Band-mills.*—(*a.*) All band-mills and band resaws shall be adequately protected when running.

(*b.*) Every band-mill wheel shall be carefully inspected at least once a month, and all hubs, spokes, rims, bolts, and rivets subjected to hammer tests and examined thoroughly.

(*c.*) Every band-mill shall be equipped with a saw-catcher or rest of substantial construction.

(*d.*) Opening above band-mill into filing-room shall be boxed and covered, with a cross-bar to lock same.

5. *Band Resaws.*—(*a.*) These shall have gears covered on feed-rolls and shall have a sufficiently heavy board up in front to catch the blow in case saw should break.

(*b.*) Guards shall be installed to cover both upper and lower wheels of all band resaws.

(*c.*) The up-travel shall be completely guarded, and the down-travel shall be guarded with a shield extending down to the guide.

6. *Circular Saws.*—(*a.*) A screen of wire cloth or other suitable device shall be so placed on circular-saw mills as to protect the sawyer from flying particles.

(*b.*) Circular-saw mills shall be equipped with safety guides, which will admit of adjustment without the use of a wrench or other hand-tool.

7. *Edgers.*—(*a.*) There shall be a screen of wire cloth or wood both back and front of the edger to prevent flying knots, chips, etc., or the top of the edger must be completely covered over.

(*b.*) Bench- or single-saw edgers shall be equipped with splitter and saw-guard.

8. *Live Rolls.*—(*a.*) All live-roll gears shall be guarded on the top, bottom, and sides.

(*b.*) Driving-shafts of live rolls shall be guarded on top and sides.

9. *Jump-saws.*—Jump-saws shall be guarded below the top of the roll and a stop shall be provided which will prevent any timber from being thrown off the live-roll case and on to the carriage-track.

10. *Swing-saws.*—All swing-saws shall have guard over front and safety stop to keep them from swinging out too far.

11 *Slashers.*—Slasher-saws shall be guarded front and back.

12. *Trimmers.*—A guard shall be provided in front of all trimmer-saws unless the method of control is such that no employee is required to stand in direct line with any saw while it is cutting, and in the case of overhead trimmers, where the duties of employees require them to stand in the rear of the trimmer-table, a guard shall be provided in the rear of the saws.

13. *Conveyors.*—(*a.*) When the return strands of conveyors operate within 7 feet of the floor, there shall be a shallow trough provided of sufficient strength to carry the weight resulting from a broken chain.

(*b.*) If the strands are over 7 feet from the floor, a means shall be provided to catch and support the ends of the chain in the event of a break over passage-ways or runways.

LATH-MILLS.

Lath-bolters.—The gears and sprockets of lath-bolters shall be fully guarded and the feed-chains shall be guarded to as low a point as the maximum height of the stock will permit.

Lath-machines.—The feed-rolls, saws, gears, sprockets, and chains of lath-machines shall be guarded.

SHINGLE-MILLS.

1. *Vertical Shingle-saws.*—With the exception of that portion against which the stock is fed, the shingle-saws shall be guarded. To make provision for the clearing of waste from the saw, it is permissible to leave the periphery of the saw open, provided that the guards shall extend not less than 6 inches beyond the point of the saw-teeth.

2. *Clipper-saw.*—(*a.*) A guard over saw shall be maintained at all times.

(*b.*) Clipper-boards shall be equipped with finger-guards.

3. *Shingle-jointers.*—The front or cutting face of knife-type shingle-jointers shall be fully guarded, with the exception of a narrow slot through which the shingles may be fed against the knives.

4. *Power-bolters.*—These shall have spreader behind saw and railing of standard size around carriage-track from front of saw.

5. *Pinion-gears.*—These shall be covered on all shingle-machines.

6. *Drag-saws.*—All gears and frictions on drag-saws shall be guarded.

7. *Fly-trips.*—Fly-trips shall not be used on shingle-machines.

WOOD-WORKING.

1. *Machines with Knife-heads.*—All knife-heads of wood-shapers and similar heads of other machines not automatically fed shall be guarded, or forms shall be used in which the part operated on is securely fastened. All knife-heads of wood-working machines which are automatically fed, such as stickers, planers, etc., when exposed to contact, shall be guarded.

2. *Wood-jointers.*—All wood-jointers shall be equipped with cylindrical cutter-heads of safety type. A suitable automatically adjusted guard shall be placed over the whole cutting-space in the table.

3. *Sanding-machines.*—Disk sanders shall have the circumference and back of the revolving head thoroughly guarded. Belt-sanders shall have both pulleys enclosed.

4. *Jump-saws.*—To prevent any one from approaching too near saw from back, jump-saws shall have railing.

5. *Swing-saws.*—All swing-saws shall have guard over front and safety stop to keep them from swinging out too far.

6. *Cut-off Saws.*—These shall rest in hood when idle.

7. *Table Rip-saws.*—These shall have spreader behind them and hood over top.

8. *Revolving Cut-off Saws.*—These shall be boxed beneath table so they cannot be reached without removing cover.

9. *Band-saws.*—(*a.*) These shall have gears covered on feed-rolls and shall have heavy board up in front to catch the blow in case saw should break.

(*b.*) Guards shall be installed to cover both upper and lower wheels of all band-saws.

(*c.*) The up-travel of all band-saws shall be completely guarded, and the down-travel shall be guarded with a shield extending down to the guide-rolls.

LAUNDRIES.

1. *Flat-work Ironers.*—A feed-roll guard shall be provided for all flat-work ironers and kept in good working-order.

2. *Collar and Cuff Ironers.*—All collar and cuff ironers shall be equipped with guards in front of the first rolls to prevent the hands of the operator from being drawn into the rolls.

3. *Body-ironers.*—Asbestos shield over heated roll shall be provided for all body-ironers, same to act as a guard for upper portion of roll. All body-ironers installed hereafter shall have finger-guards.

4. *Handkerchief-mangle* shall have guard for feed-roll.

5. *Extractors.*—All extractors shall be provided with cover, same to be kept closed when machine is in operation.

6. *Washing-machines.*—All washing-machines and tumblers shall be equipped with brakes and lock or other device to prevent the inner cylinders from moving during the loading and unloading process.

7. *Belting.*—Whenever women are liable to come in contact with belting, it shall be guarded so as to prevent it from attracting their dresses or hair.

8. *Pulleys.*—All pulleys and gears shall be guarded in such a manner as to prevent women's aprons or dresses from being caught.

ELEVATORS.

1. *Elevator Catching Device.*—All elevators, except direct-lift plunger elevators, shall be equipped with an automatic device to catch the car in case it drops.

2. On catching devices to which speed-governors are attached, the dogs or clamps of such catching device shall be attached to the under-side of the car platform.

3. All power-driven elevators shall be provided with automatic stops which shall stop them at the lowest and at the highest landings, independent of the operating cable or other device.

4. Safety devices shall be tested for efficiency at least once a month, and a record thereof kept for inspection by the Board or its Inspectors.

5. *Freight-elevator Gates.*—(Except with the consent of the Board.) At each landing gates shall be self-closing and not less than 5½ feet in height, except at top landing, where such gates shall not be less than 3½ feet in height. The bottom rail on all gates shall be not more than 12 inches from the floor.

6. In case local conditions do not permit of a gate 5½ feet in height, a gate not less than 3½ feet in height may be used, provided such gate is placed not less than 12 inches from the platform of the car, and provided that tell-tale chains not less than 4 feet long and not over 5 inches apart are suspended from the edge of the platform in front of opening.

7. *Elevator-shafts—Projecting Floors, etc.*—All projections in shaft, such as floors, beams, sills, unless guarded against by the car enclosure, shall be provided with smooth bevelled guards, fitted directly under such projection so as to push any projecting portion of the body back into the car instead of crushing it. This bevelled guard shall be set at an angle of not less than 60 degrees with the floor-level.

8. *Freight-elevators—Enclosure of Car.*—(Except with the consent of the Board.) All freight-elevator cars shall be enclosed solidly on all sides except on entrance side to a height of not less than 6 feet. On side of the operating cable sufficient space shall be allowed to operate the cable.

9. All elevator-cars except sidewalk elevators shall be equipped with a covering over the top; this to be made solid or of wire screen, and shall be not less than No. 10 wire and with mesh net over 1 inch. On freight-elevators the part of such covering which faces the opening to the shaft shall be constructed with a section of not less than 18 inches in width and extending the width of the opening to the shaft. Such section shall be attached with hinges to the screen, so that it will rise when it meets with an obstruction as the car descends.

10. *Shipper-rope Locks.*—All power-driven freight-elevators controlled by shipper-ropes shall be provided with lock, so arranged that the car can be locked at each landing.

11. *Machine Slack-cable Safety Device.*—Slack-cable devices, which will stop the elevator machines if the hoisting-cables slacken or break, shall be provided on all winding-drum power elevators having a travel of over 15 feet.

12. *Signals.*—There shall be a bell located in every power-driven freight-elevator or in the shaftway where it may be heard on all floors, and so arranged as to be operated from each landing.

13. *Mechanical Devices* shall be kept clean and free from excessive grease and dirt.

14. *Cables* shall be renewed when, through broken wires, wear, undue strain, or other conditions indicating deterioration, they are considered unsafe.

15. *Overhead Sheaves.*—Where the overhead machinery consists only of sheaves, a metal grating or screen shall be placed under such sheaves and extend over the entire shaftway and give safe access to the sheaves from the floor or roof of the building. The grating or screen shall be of sufficient strength to sustain a load at centre of span of not less than 500 lb., with a factor of safety of 4. The openings in such gratings or screen shall not be wider than 1 inch.

PENALTY.

Every person who contravenes any of the aforesaid regulations shall be liable to a penalty of $50.

Accident-prevention measures have not only meant fewer injuries and consequently less suffering and distress to workmen and their families, but has increased the efficiency of the plant's operation, so economic gain has followed.

ORGANIZATION.

The work of making operations safer and of showing employers and workmen how to organize to prevent accidents, many of which are due to carelessness and therefore avoidable, has been primarily one of the functions of the Board. It is recognized that preventable accidents are generally attributed to carelessness, insufficient inspection by employer, inexperience, unsafe practices, lack of safeguards, violation of instructions, indifference, defective equipment, poor judgment, and other indirect causes. The accident-prevention movement aims at minimizing such preventable accidents. It would appear that in some of the larger plants this accident-prevention campaign, assisted by efficient first-aid service, has resulted in reducing by 20 to 50 per cent. the number of accidents and attendant lay-offs that have occurred in past years. The financial records of these plants appear to bear out the foregoing conclusion.

Experience has proved that the satisfactory conducting of an accident-prevention campaign requires organization for carrying out three branches of work, as follows:—

(1.) An organization that provides an enthusiastic and hard-working safety committee or department, adequate inspection system, and hearty co-operation of officials and workmen:

(2.) A system of education that will assist all workmen to follow more careful, safe, and proper methods of work and will keep them constantly alert to the need of caution:

(3.) A scheme of safety measures designed to eliminate as far as possible dangerous conditions that have caused accidents or may cause them.

In this work the Board has had considerable assistance from workmen. These workmen have from time to time brought to the attention of the Board different plants and places of employment where more efficient safety-work might be done, and also from time to time have made valuable recommendations. It is realized that the workmen who daily come in contact with danger-zones are in a better position to give advice as to dangerous conditions than is an Inspector who possibly cannot visit the plant more than twice a year. Then, again, we feel that it is the duty of the workman to co-operate with the Board, so as to make safe his particular part of the plant or place of work not only for himself, but for his fellow-workman. From the above it can be seen that an essential element of accident-prevention work is the co-operation of the workmen themselves.

The various Inspectors under the "Factories Act," "Boilers Inspection Act," "Metalliferous Mines Inspection Act," the "Electrical Energies Act," and the "British Columbia Railway Act" have made over 1,400 inspections for the Board during the past year, the result of which has

been the installation of numerous mechanical safeguards and the improvement of working conditions from a safety standpoint. Their hearty, energetic, and careful work is much appreciated.

Employers throughout the past year, with one exception, have complied with the accident-prevention regulations and other suggestions for accident-prevention measures. This excellent co-operation has greatly facilitated the work and turned what would ordinarily be a disagreeable task into a work of pleasure, which in the end cannot help but bear fruit from a humanitarian as well as an economic standpoint. Only in one case above outlined was it necessary to close down a portion of the machinery of one plant until the proper safeguard had been installed. The opposition to the instalment of this safeguard was, we believe, more a case of ignorance than a deliberate desire to impede the work.

(*c.*) STATISTICAL.

In presenting the following data collected by the Statistical Department during the year 1918, it cannot be too firmly impressed upon the reader that the tables given do not intend to, and do not, represent the amounts paid as compensation in the different classes during 1918 by the Workmen's Compensation Board, neither do they deal with the total accidents occurring during the said year. The information given is obtained only from the accidents which were finally disposed of during 1918 irrespective of the year in which they occurred. It would be manifestly impossible to give reliable figures upon any other basis, since the extent of a workman's disability and the amount of the compensation to which he may be entitled cannot be estimated accurately, but must be decided by lapse of time. Many of the accidents dealt with, therefore, occurred during 1917, and conversely a large number of accidents which occurred during 1918 are not included, final payments on same not having been made. It is felt necessary that this explanation should be made since otherwise misconceptions might arise, and wrong deductions be made, were these facts not thoroughly understood.

In collecting information the Department has endeavoured to make an exhaustive analysis of the three primary classifications which are acknowledged to be vital to sound statistical work, i.e.:—

(1.) Industry:
(2.) Cause:
(3.) Nature of injury.

And whilst other interesting and doubtless useful information has been added, the main tables are based upon the aforementioned classifications.

Table A deals with the amounts paid out for temporary total and permanent partial disability and fatal accidents according to the particular industry in which they occurred. It will be noticed that the lumbering industry is responsible for a large percentage of accidents dealt with. Whilst it is true that lumbering is probably the principal industry of the Province, and that the industry would in consequence have a large number of accidents, it is also true that a number of these accidents could have been avoided by the exercising of a little more care upon the part of the employers and employees. It would not be possible to enter into minute details covering such accidents, but, to take a particular cause only, it might be mentioned that there have been several fatal accidents caused by the fastening of cables to dead trees, which trees, breaking when a strain was put upon the cable, fell upon the workman standing underneath same. Had a proper amount of care been taken in the selection of these trees, some of the accidents therefore could undoubtedly have been avoided. It might reasonably be argued, however, that in both the lumbering and ship-building industries (the latter being also responsible for a large percentage of the accidents) the number of accidents was adversely affected by a war-time demand for quick production, a shortage of skilled men, and a lack in many instances of the required material, necessitating the use of second-hand goods or makeshifts.

Table A 1 is a summary of all totals shown in Table A.

Table B deals with 8,841 temporary total disability accidents finalled during 1918. Taking the various accidents in the respective classes, the following particulars are shown:—

(1.) Workman's total wage loss:
(2.) Average compensation paid in the different classes:
(3.) Average daily wage:
(4.) Sex:
(5.) Conjugal state:
(6.) Average age:
(7.) Whether the workman was receiving other sick benefits:
(8.) Nationality.

Particularly noticeable features are the few women workers injured and the small percentage of workmen who were receiving other benefits, and who would consequently have been receiving no remuneration during the periods of disability were the "Workmen's Compensation Act" not in operation.

Table B 2 is a summary of totals shown in Table B.

Table C shows that causes of the various accidents dealt with and the amounts paid out for time lost, permanent partial disabilities, and fatals. It is of interest to note that included in "Accidents not elsewhere classified" is compensation paid for an aeroplane accident, the machine crashing in the City of Vancouver whilst the airman was testing out the aeroplane on behalf of the Provincial Government. Doubtless such claims will become common in the future, but to date this one is unique as far as this Board is concerned.

Table D shows the various parts of the workman's body which were injured in 8,841 temporary total disability accidents, the nature of the injury, and the classes of industry in which such injuries occurred.

Table E covers the permanent partial disability cases in which the workman lost one or more members of the body, suffered an impairment of same, underwent the loss or impairment of one of the five senses, or was facially disfigured. This is of special interest, since it is possible to group the injuries fairly representatively and to thus ascertain the average amount paid by the Board for a particular injury.

Chart 1 is drawn to show the respective proportions of 8,841 temporary total disability accidents according to the various classes of industry in which they occurred, the total being made up as follows:—

Ship-building	1,444
Logging	1,282
Sawmills	943
Coal-mining	932
Quarrying and mining	686
Railways	668
Navigation and stevedoring	341
Shingle-mills	288
Smelting	276
Manufacturing	258
Pulp and paper	246
Building and construction	243
Wood-working	225
Metal-working	201
Canning and packing	186
Machine-shops and foundries	182
Teaming	90
Municipalities	84
Explosives and chemicals	79
Wholesalers	41
Fishing	37
Miscellaneous	33
Provincial Government	26
Telegraph and telephone	22
Laundries	18
Janitors	10
Total	8,841

Chart 2 shows the proportions of 8,841 temporary total disability accidents with regard to the cause of such accidents, the figures being:—

Falling objects	1,954
Handling heavy objects	924
Hand-tools	899
Slipping and stumbling	738
Carried forward	4,515

Brought forward	4,515
Falls of persons	545
Power-working machinery	515
Conveying apparatus	469
Flying objects	383
Vehicles and transportation	456
Mine-cars	371
Striking projections	353
Sawmill machinery	227
Electricity and heat	215
Shingle-mill machinery	166
Poison	127
Transmission apparatus	112
Animals	102
Autos and motor-cycles	99
Explosions	73
Sharp instruments	28
Prime movers (steam and gas engines)	27
Shutting doors	21
Miscellaneous	14
Steam-pressure apparatus	13
Miscellaneous machinery	10
Total	8,841

Chart 3 is representative of the causes of 420 permanent partial disability (or the more serious) accidents, segregated as follows:—

Power-driven machinery	81
Shingle-mill	59
Falling objects	50
Sawmill machinery	45
Conveying apparatus	32
Flying objects	31
Handling heavy objects	25
Vehicles and transportation	19
Hand-tools	16
Transmission apparatus	12
Mine-cars	10
Slipping and stumbling	7
Falls of persons	7
Striking projections	6
Explosions	6
Prime movers (steam and gas engines)	4
Electricity and heat	3
Miscellaneous machinery	3
Animals	2
Shutting doors	2
Total	420

Interesting comparisons can be drawn by studying Charts 2 and 3 together, when it will be found that there is a wide discrepancy in the percentages of causes covering temporary total (or less serious) accidents and the permanent partial (or more serious) accidents. For example, "Slipping and stumbling" was responsible for 738 accidents, or 8.33 per cent. of the first named, whereas it only appears in Chart 3 as causing 1.66 per cent. of the permanent partial accidents. Again, whilst "Shingle-mill machinery" was the cause of 1.87 per cent. of the lighter accidents, the percentage in the more serious cases was 14.05 per cent., and so forth.

TABLE A.—STATEMENT SHOWING TOTAL AMOUNTS PAID IN EACH INDUSTRY ON ACCOUNT OF ALL FINALLED ACCIDENTS DURING 1918.

Sub-class.	Industry.	FINALLED TEMPORARY TOTAL DISABILITIES.		FINALLED PERMANENT PARTIAL DISABILITIES.						FATAL ACCIDENTS.					ALL FINAL AWARDS.
				CASH PAYMENTS.		MONTHLY PENSIONS.		TOTAL P.P.D. AWARDS.		PENSION AWARDS.		BURIAL AWARDS.		TOTAL FATAL AWARDS.	
		No. of Claims.	Amount of Compensation paid.	No. of Claims.	Amount.	No. of Claims.	Reserve.	No. of Claims.	Total P.P.D. Cost.	No.	Reserve.	No.	Amount.		Total Amount.

CONCLUSION.

RE UNIFORM WORKMEN'S COMPENSATION LEGISLATION FOR WESTERN PROVINCES.

During the month of September the Government appointed the Chairman of the Board to meet the representatives of the Provinces of Manitoba and Alberta on the question of uniform workmen's compensation legislation for the Western Provinces.

With the Honourable T. H. Johnson, Attorney-General representing Manitoba, and Mr. J. T. Stirling, Chairman of the Alberta Board, representing Alberta, the conference met in the Board offices in Vancouver on September 30th, 1918, and was continued on October 1st and 5th.

A thorough discussion of the different Acts was had, and while the representatives gained a useful knowledge of the legislation of the other Provinces, it was found that to secure any uniformity would involve radical changes, in some cases in the duration of payment to the injured workmen or the dependents; in others, in the medical service; and again in the methods of carrying the Accident Fund. The British Columbia representative feeling that the only means of securing uniformity would be to "level up" the legislation of the other two Provinces to the standard of the British Columbia Act, while Mr. Johnson and Mr. Stirling would naturally desire that radical changes in their legislation should arise from local requirements, the results then were that no definite conclusions were arrived at. But as the interprovincial character of many industries, and also the movements of workmen from one Province to another, makes uniformity in this type of legislation desirable, it was decided to submit the matter to the recently formed Commission to secure uniformity of laws throughout the Dominion.

HEALTH INSURANCE.

The recent war has proved that military success depends on industrial efficiency. This efficiency is mainly the result of the mental and physical condition of the individual worker.

Many of the large plants of the Atlantic Coast, recognizing the influence of health and home conditions on the efficiency of the workman, have established health departments in charge of competent physicians to care for the requirements of the workman and his family. The fact that the tendency in this direction is rapidly extending, and in this age when competition is at its peak, is the best possible evidence that from a financial standpoint the service is justified.

Briefly summarizing, a workman is at his maximum of efficiency when in good health and when not depressed by fears arising from home conditions that he is unable to cope with. A value cannot be placed on this factor, yet it is safe to assume that under these circumstances errors of judgment that lead to waste in time and material and frequently injury to the workman himself are at a minimum.

One of the greatest items of waste in modern society is the time lost and the reduction in physical standard caused by disease that could either have been prevented or at least limited by efficient medical service. Another factor is the loss sustained by a family when its support is either withdrawn by death or a long siege of illness.

If our reasoning is correct, we are forced to the conclusion that the health of the workman and his family, as well as his ability to meet the financial requirements of the home, are matters of public concern.

Benefit societies have done and are doing good work in this direction, but the multiplicity of effort, the lack of uniformity, and the absence of compulsion restricts their usefulness to a narrow field. It would therefore seem that the problem can only be met by State control of medical service and payments in case of sickness or death similar to accident insurance.

Fortunately for those who take this view, the duty of the State in these matters has already been decided in England in favour of the workman. Several of the Eastern States are paying particular attention to this subject. We early realized the necessity of health insurance, and at every opportunity when addressing the different organizations endeavoured to direct public attention in its favour. It is, we believe, a matter for congratulation that the subject has already been brought to the notice of the Legislative Assembly of this Province.

Our interest in this question is particularly emphasized by the fact that our work brings us constantly in contact with these matters. For instance, during the first year's operation of the Act we repeatedly found cases where the workman did not obtain medical service, the invariable excuse being that he hoped to avoid the expense, or that he felt that he could not pay for it, wrongly believing that he would be responsible therefor.

In the closing months of the last year we have been compelled to reject a number of claims arising out of the influenza epidemic, in which mothers with small children made application for pensions. One case was particularly painful. When informed that we must reject her claim, the mother of eight small children asked us in desperation: "What am I to do?" We were unable to answer. She withdrew from the Board room accompanied by two of her frightened children clinging to her skirts, and one in her arms, to answer the question as best she could.

These experiences also compel us, at the risk of being censured for going outside of our sphere, to call attention to the enormous wastage of life, health, and happiness through failure or inability to obtain medical attention. An example of the latter was presented to us early in January last, when a widow with four children, having no other resources but her pension of $40 per month, inquired as to whether the Act permitted her medical attention for herself and family. In such a case medical services could only be paid for out of the funds which were much needed for food and clothing.

The full import of this situation does not present itself to those resident in the centres of population, and where medical charges are at a minimum. In the outlying sections of the Province, where mileage is added to the medical fee, the matter is much more serious. If we compute the costs of cases of delay in calling, or absence of medical attention, in loss of work, in lowered vitality, in the failure to secure early isolation in infectious diseases, and in premature deaths, we cannot avoid coming to the conclusion, from the humanitarian as well as the economic standpoint, that the time has now arrived when there should be State health insurance.

During the year, as in the previous years, the members of the Board as a body, in pairs or singly, addressed labour bodies, commercial organizations, Boards of Trade, Medical Associations, Hospital Associations and the Boards thereof, as well as fraternal organizations, explaining the Act's requirements and soliciting co-operation from them as well as the public. The members

of the Board have at all times held themselves in readiness to address any body that was interested in the Act's requirements, and to take up with that body or any individual members or parties interested in the work any question upon which they sought a better understanding.

An Information Bureau is maintained at the Board offices in the Board of Trade Building at Vancouver, so those desirous of obtaining information may do so, or if unable to appear in person a letter would receive immediate and courteous attention. Copies of the Act or the Board's report or any other of the Act's requirements may be received for the asking.

During the year many thousands of circulars have been sent out from the offices to the different branches of industry, the different employers, to the Medical Associations and members thereof, in an endeavour to clear up those misapprehensions that would appear to arise from time to time.

The Board desires to bear public testimony to the excellent, whole-hearted, and efficient service rendered by the various members of the staff in the energy and care of the work passing through their hands, as well as their courteous treatment of the public, on which, to a great extent, depends the success of the work.

Respectfully submitted.

E. S. H. WINN,
Chairman.

REPORT OF MEDICAL SUPERINTENDENT

FOR THE YEAR ENDING DECEMBER 31ST, 1918.

The Honourable the Provincial Secretary,
Victoria, B.C.

SIR,—I have the honour to submit herewith the Forty-seventh Annual Report of the Public Hospitals for the Insane at New Westminster and Essondale, B.C. This report embraces a full account of the operations of these institutions for the year 1918, together with a summary of the requirements for the ensuing year, which I trust may receive the approval of your Department before the Estimates of the Provincial Legislature are framed.

It will be noticed that the accompanying statistical tables, covering the operations of the Hospitals during the year, differ in some details of form, although little in content, from those published in former years.

ADMISSIONS.

During the year 371 patients were admitted, a very large number when the admissions of a few years ago are considered. This phenomenally rapid increase has at times taxed to the utmost our accommodation. True, the taking-over of the modern building at Saanich as a hospital for our criminally insane will relieve the situation to some extent, and will permit of the proper segregation of this class of our insane for years to come. Still, the necessity for a modern hospital for the proper and scientific study and treatment of our acute cases still exists, and I would strongly advise the early consideration of the erection of such a building at Essondale for male cases; such a building to contain the best features of a modern psychopathic hospital.

The burden upon the taxpayer of caring for the constantly increasing numbers of insane has occasionally given rise to a division of sentiment when the question of appropriations for their care has been under discussion, but I can assure you that those members of the Legislature who oppose a liberal and enlightened policy do so under a mistaken idea of economy. It is astonishing that even among some of the members of the medical profession there are those who insist that active treatment by the more expensive hospital methods, hydrotherapy, and laboratories with expensive apparatus and equipment is of no avail, except to increase expense and make a show, and that formerly, in the time of the old strait-jacket, box-bed, and seclusion, patients recovered with none of these costly aids as frequently, or nearly as frequently, as with them. This is the attitude assumed by those who, it is hoped, constitute only a very small minority in this enlightened Province.

We are obliged, in candour, to concede that, notwithstanding the general adoption of hospital methods in the treatment of our insane, with the laboratory and various modern therapeutic measures, we have failed to establish as high a rate of recovery as we would like, but to some extent we have been successful, and we are determined, sir, with your assistance, to further adopt the methods of the general hospital, rather than that of the asylum, to simply feed, clothe, and comfortably shelter the insane, or, in other words, to simply render custodial care.

In further considering the matter of increased admissions, it may be said that, notwithstanding the existing laws regarding immigrants and immigration, which are supposed to prohibit the entrance into this country of the feeble-minded, insane, and those suffering with incurable diseases, a tremendous number of such are, in some way, continuously gaining admission, and the necessity for some method of more adequate supervision and intelligent inspection, not by laymen, but by medical men with the proper experience as phychiatrists, is yearly becoming more apparent.

Our existing Dominion legislation has now been in effect for some twelve years, and the question naturally arises as to the effect it has had on preventing the entrance of the insane and others of the proscribed classes which furnish such a burden on the various Provinces. This question can best be answered by stating the number or proportion of those cases resident in our public institutions. In our British Columbia institutions not quite 8 per cent. are British Columbia born, and not over 20 per cent. Canadian born. Surely these statistics are sufficient

to demonstrate conclusively that the burden imposed upon the Province in providing proper accommodation for insane, who properly belong to other countries, is of much importance to us as a Province.

Take the financial aspects of this undertaking, and I think it will surprise you, just as much as it did me, after I had commenced to figure out exactly what it meant. To arrive at any intelligent conclusion as to just what this might be, let us figure exactly. Take New York State, where the Comptroller has recently appraised their score of institutions in order to estimate exactly what *per capita* investment the State had in connection with their insane; he found this to be a *per capita* one of $1,000, or a total investment of $47,000,000. This represents the cost to the State in providing institutions and plants for the care and treatment of their insane.

In our Province we have a *per capita* investment of about $1,000, and if we would consider interest on the money invested, which would seem fair at 4 per cent., and estimate the amortization cost at 3 per cent., to cover general depreciation of buildings, equipment, etc., we have a total charge of 7 per cent. on the original investment. Our average *per capita* cost for maintenance during the past five years has been $200, while the cost of committal, transportation, etc., would amount to about $5 as a fair average.

The total *per capita* cost to the Province can therefore be summarized as follows:—

Interest on investment and equipment	$ 70 00
Maintenance	200 00
Other costs	5 00
Total *per capita* annual cost	275 00

Take our last year's admission of 375, and we find that 72 per cent., or 270, were foreign born; this 270, at a cost of $275 per head, would represent $74,250, the actual cost to which the Province was unnecessarily put. This, however, is only for one year, but we have found here (as has also been found in older institutions, where statistics extend over many years) that the average hospital-life of each patient is ten years; therefore those of foreign birth admitted to this Hospital last year alone will, before we are through with them, cost the Province $742,500.

I go into this matter in the above cold-mannered way in order to show you just how very important the matter of promiscuous immigration is to one Province, in only one branch of incapables, and to give you some idea of what a tremendous burden it will eventually become if allowed to go on. To emphasize this, I would call your attention to the fact that, in the United States, where promiscuous immigration went on for many years, the problem in New York State has assumed such astonishing proportions that last year it became necessary for that State to devote practically one-fifth of its entire revenue to care for an insane population which they estimate, if strict immigration laws had been enforced for the past twenty years, would not be 40 per cent. of what it is at the present time.

It would appear to me that this question should be one of the very first to be taken up by the newly formed Canadian National Committee for Mental Hygiene, and if the committee could secure effective results a great national good would be accomplished.

TREATMENT.

The time has now arrived in this Province when voluntary admission and the establishment of a psychopathic wing in connection with our largest general hospital should be established. It would appear that Vancouver should be the city and the Vancouver General Hospital the hospital. The establishment of such a psychopathic hospital with voluntary admission would immediately have the effect of making the public understand the fact that insanity is a disease requiring early and careful treatment, and would also undoubtedly, in a considerable percentage of cases, obviate the necessity for legal committal.

If a proper outdoor service was also established in connection with this psychopathic department, great assistance to the Province could be given. If such an outdoor service was in charge of qualified men, it might be hoped that they would be able to pick out many of those types liable to develop psychoses, and to protect them from those classes of stress which they are least able to withstand. The neurotic child would be recognized and could be safeguarded, especially throughout school-life and the period of puberty and adolescence. In my mind there is no doubt that competent advice would be sought by parents as to the best methods to be employed in the rearing of their children. Until then it might be said we are largely helpless in the matter of prevention.

Front entrance to Hospital.

In the treatment of the psychoses the general principles of therapeutics are, of course, applicable, as in other departments of medicine, and have been followed by the medical staffs of our hospitals. To provide good treatment and obtain good results an intelligent, well-trained, and conscientious staff is necessary. The happiness and welfare of the patients while they are in our hospitals depend greatly on the character and conduct of the nurses, male and female; upon their efficiency depends, hourly and momentarily, the safety of the patients; while upon their humanity and conscientiousness depend, continuously, the comfort, happiness, and well-being of the afflicted assigned to them.

I am glad that you, as Provincial Secretary, have fully realized the manifest and overwhelming importance of this question, and as a result have never placed in any way the slightest obstacle against the instant dismissal of employees for brutality and insubordination. Without strict discipline and full authority to discharge nurses and attendants for sufficient reason, the best superintendent that ever breathed is powerless to effect any improvement in his patients or in the hospital over which he is the head.

I am pleased to be able to report that the pathological department is again in full operation, affording full facilities for scientific work directly connected with our ward cases, and essentially as an aid to diagnosis, and it is encouraging to realize that it is achieving its purpose in a manner which is creditable to our institution.

Occupational Therapy.

The necessity and wisdom of liberally providing means of diversion for the insane is so generally admitted that the question is scarcely, if at all, in the field of controversy. In observance of this well-recognized fact we have given our patients every form of amusement, employment, and diversion possible under existing conditions. Encouragement has been given them to work in the shops, in the gardens, on lawns, and in various departments of the farm. Weekly dances, concerts, and picture-shows have been given throughout the winter season, while tennis, baseball, and football have been a source of pleasure and helpful comfort to a considerable number during the summer months.

I would like here to give expression to our experience in agricultural pursuits as an occupational therapy with our insane. We have found that work, and especially work in the open air and in open and healthy surroundings, is of the utmost value for mental patients. Being a factor in the production of health and happiness, it also becomes a means of cure. I maintain that where work for patients is carefully organized the mortality-rate is decreased, mechanical restraint is unnecessary, and recoveries are more frequent; the spirits of the patients are brightened, the labour of those who attend them is ameliorated, and the mission of the Province, which thus provides not only for the custody but also for the recovery of its patients, is ennobled. I therefore claim that our large farming operations are not only the best therapeutic help, but also an economical and productive one, and should continue to receive every encouragement and assistance that our Government can afford to give it.

In providing entertainments and amusements for the patients, the same emphasis as in occupational training is placed upon the idea that its primary purpose is to aid in the patients' mental restoration. Unless a cheerful, helpful atmosphere pervades an institution, the best results are unattainable, no matter what other facilities or what professional skill may be available. The mentally diseased are out of harmony with their environment, and environmental conditions in a hospital should be such as to render simple readjustments easy and inviting and essential to any process of improvement.

Expenditure.

The effect of war conditions is graphically shown in the summary contained in Tables E and F. Despite every effort to eliminate every item of expense not imperatively necessary to maintain a proper standard of care, the cost of maintenance has increased slightly over the previous year. During the year the price of practically all supplies purchased by the Hospitals advanced approximately 35 per cent., while during the latter part of the year it was not always so much a matter of price in making essential purchases as of finding dealers able to furnish supplies in the quantities required to meet the Hospitals' needs. Under such circumstances I think the net *per capita* cost of maintenance—namely, 56 cents per diem at New Westminster and 63 cents per diem at Essondale—is a very creditable one, and in this connection much credit is due our Bursar, Mr. Macgowan, and also our Chief Stewards, Mr. Pumphrey and Mr. O'Reilly.

Daily average population for year, 752.78.
Gross maintenance *per capita* cost per year, $295.03.
Gross maintenance *per capita* cost per day, 80.80 cents.
Net maintenance *per capita* cost per year, $232.609.
Net maintenance *per capita* cost per day, 63 cents.

REVENUE.

You will note that the revenue of the hospital shows considerable increase over any previous years. Close attention was given this matter, but I feel sure that we have in no instance worked a hardship on relatives of patients where leniency should have been shown.

The following table will show clearly the yearly collections at this office since the time of the institution's inception, and is worthy of your notice:—

1873	$1,440 99	1890	$ 599 24	1907	$20,753 35
1874	680 00	1891	761 15	1908	25,807 83

REQUIREMENTS.

The decision to take over the modern building at Saanich as a hospital for the criminally insane will permit us ready facility to overcome a long-felt want—namely, an opportunity of segregating in proper quarters this class of our insane; and, while the building this year of properly constructed hutments for our tubercular cases has also been a move in the right direction, there still remain two features calling for early consideration and action by the Government, namely:—

(1.) The urgent necessity for a modern hospital building at Essondale for the reception, proper examination, and scientific care and treatment of acute cases; such building should have accommodation for 200 cases and should contain the best features of a modern psychopathic hospital.

(2.) The second requirement is the proper provision for the more marked cases of the feeble-minded of the Province. The problem of the feeble-minded is one that is going to be with us for a long, long time, unless we do something to correct it; any Provincial plan for the care of the feeble-minded must relate itself definitely to the public-school system; under our compulsory-education law every child should come to the attention of the school authorities, and if there was a proper mental examination of the pupil the school record would eventually constitute a complete registration of the feeble-minded. It is surely as important, or even much more important, to train, properly, subnormal as normal children. In the more marked cases this should be done in special institutions, and I would advise early consideration of the erection of a group of buildings for this purpose.

Before closing this report I not only wish to thank personally, but to commend to your favourable consideration, the Assistant Medical Superintendents, Dr. Steeves, of the New West-

minster Institution, and Dr. Crease, of the Essondale Institution, and also the other Medical Officers, who, without exception, have laboured diligently and conscientiously to promote the administration of the Hospital throughout the year; the efficiency and untiring zeal at all times rendered by these officers have made my duties indeed very light. Your attention is also called to Dr. F. P. Smith's dental report; very satisfactory work has been done in this Department.

I wish also, sir, to express to yourself and to the other Honourable Members of the Cabinet my sincerest appreciation of your uniform support in all matters pertaining to the promotion of the Hospitals' best interests.

I have the honour to be,
Sir,
Your obedient servant,

C. E. DOHERTY,
Medical Superintendent.

LABORATORY REPORT.

Laboratory of Provincial Mental Hospital.
Coquitlam, B.C., January 1st, 1919.

Dr. C. E. Doherty,
Medical Superintendent, Public Hospital for the Insane,
New Westminster, B.C.

Sir,—I have the honour herewith to report work done during 1918. The cleaning-up of the outbreak of diphtheria which commenced in December, 1917, occupied most of the time during the first two months of the year, and in all 3,000 cultures were taken.

It was found necessary to close the Laboratory for four months to carry on the work of the Clinical Clerk, and Mr. Gooding carried on this work until a stenographer was obtained.

A routine Wassermann blood test for syphilis was made on each admission if at all possible, and a positive reaction of 13.64 per cent. obtained on the year's admissions. The test was also applied to some of our older admissions, and a total number of 445 examinations were made. An acetone insoluble fraction antigen, checked by a cholesterin reinforced alcoholic extract of human heart antigen, gave most satisfactory results. The cholesterin antigen, being more sensitive, picked up many positive reactions not held by the acetone insoluble one. In addition, each patient's serum was tested for natural anti-sheep amboceptor and removed if present, thus ensuring against a false negative reaction.

Routine work done was as follows:—

(*a.*) Autopsies done, sections made and filed.

(*b.*) Blood examinations—

Complete counts	21
Differential counts	14
Wassermann test for syphilis	445

(*c.*) Cultures—

Nose and throat	1,950
Blood	3
Abscesses	2

(*d.*) Fluids—

Plueral effusions	4

(*e.*) Miscellaneous—

Urinalyses	452
Sputa for T.B.	46
Vidal agglutination tests (triple)	6
Fæces for occult blood	2
Fæces, chemical examination	1
Wassermann test on spinal fluid	2
Noguchi's test for excess globulin	2
Smears from urethra for Gc	2
Smears for Vincent's angina	6
Smears for actinomycosis	3
Smears for streptococci	3
Vaccines (autogenous)	2
Guinea-pigs inoculated for T.B.	10

(*f.*) Work done for the farm.

All animals which died during the year were autopsied, and in every case where possible assistance was rendered to make a diagnosis of the condition, so that isolation and treatment could be carried out more judiciously. Weekly milk-counts were done, showing very low bacterial counts. Cultures from abscesses and infections were always taken to ascertain the offending organism.

In conclusion, I wish to extend my thanks to Mr. Gooding for the accurate work done and the keen interest shown by him during the year.

I have, etc.,

A. L. Crease,
Assistant Medical Superintendent and Pathologist.

DENTAL RPOERT.

PUBLIC HOSPITAL FOR THE INSANE,
NEW WESTMINSTER, B.C., January 24th, 1919.

Dr. C. E. Doherty,
Medical Superintendent, Public Hospital for the Insane,
New Westminster, B.C.

SIR,—I beg to report the following dental work done on patients in the Mental Hospitals, New Westminster and Essondale, during the year 1918, working two days per month:—

Pyorrhœa treatments	33
Extractions	494
Prophylactic treatment	109
Amalgam fillings	121
Synth. porcelain fillings	13
Cement fillings	9
Root fillings	4
Dentures	11
Repairs, bridge	3
Repairs, dentures	10
Abscesses treated	5
Porcelain crowns	2
Fractures treated	2
Dentures trimmed	5
Refitting and setting gold crown	2

I have, etc.,

F. P. SMITH, D.D.S.

Minister of Agriculture:

Hon. JOHN OLIVER.
Hon. E. D. BARROW.

Deputy Minister:

WM. E. SCOTT.
W. T. MCDONALD, Acting.

Secretary:

WM. J. BONAVIA.

Statistician:

A. B. TWEDDLE.

Secretary to Minister:

F. J. ROSSITER.
F. W. LAING.

Horticultural Branch:

M. S. MIDDLETON, B.S.A., Horticulturist and Inspector of Fruit Pests.
B. HOY, B.S.A., Assistant Horticulturist and Inspector of Fruit Pests.
E. W. WHITE, B.S.A., Assistant Horticulturist and Inspector of Fruit Pests.
P. E. FRENCH, B.S.A., Assistant Horticulturist and Inspector of Fruit Pests.
E. C. HUNT, B.S., Acting Assistant Horticulturist and Inspector of Fruit Pests.
W. H. ROBERTSON, B.S.A., Assistant Horticulturist and Inspector of Fruit Pests (on active service).
W. T. HUNTER, B.S.A., Assistant District Fruit Pest Inspector.
J. TAIT, Assistant District Fruit Pest Inspector.
H. H. EVANS, Assistant District Fruit Pest Inspector.
C. R. BARLOW, District Fruit Inspector.
H. GUTTERIDGE, Assistant Potato Inspector and Investigator of Potato-diseases.
R. C. ABBOTT, Coast Markets Commissioner and Inspector in Charge of Exports.
J. A. GRANT, Prairie Fruit Markets Commissioner, succeeding W. E. McTaggart.
J. L. HILBORN, in charge, Fruit and Vegetable Experimental Station, Summerland.
E. W. BUCKELL, Inspector on Codling-moth.

Imported Fruit Inspection Branch:

W. H. LYNE, Inspector of Imported Fruit and Nursery Stock, Rice, etc.
D. GAVET, Assistant Inspector of Imported Fruit and Nursery Stock, Rice, etc.
W. J. GRAHAM, Assistant Inspector of Imported Fruit and Nursery Stock, Rice, etc.
H. F. OLDS, Assistant Inspector of Imported Fruit, Vegetables, Rice, etc.

Plant Pathology and Entomology Branch:

J. W. EASTHAM, B.Sc., Plant Pathologist.
M. H. RUHMANN, Assistant Plant Pathologist.

Live Stock Branch:

W. T. MCDONALD, M.S.A., Live Stock Commissioner.
H. RIVE, B.S.A., Dairy Instructor and Inspector (on active service).
T. A. F. WIANCKO, Dairy Instructor and Inspector.
J. R. TERRY, Instructor in Poultry-raising.

Live Stock Branch—Concluded.

H. E. UPTON, Assistant Instructor in Poultry-raising.
H. O. ENGLISH, B.A., B.S.A., Soil and Crop Instructor.
E. W. HOGAN, B.S.A., Soil and Crop Instructor.
W. NEWTON, Soil and Crop Instructor (on active service).
G. C. HAY, B.S.A., Agriculturist.
Dr. A. KNIGHT, V.S., Veterinary Inspector.
Dr. S. A. K. WHITE, V.S., Assistant Veterinary Inspector.
Dr. W. W. ALTON, V.S., Assistant Veterinary Inspector.
Dr. B. R. ILSLEY, V.S., Assistant Veterinary Inspector.
E. RIVE, Official Milk-tester.
G. H. THORNBERY, Cow-tester.
J. W. CANDY, Cow-tester.
A. LEWARNE, Cow-tester.
E. F. WEETMAN, Cow-tester.
J. B. WATSON, Official Milk-tester.
R. J. FERRIS, Silo Demonstrator.
W. H. STROYAN, Poultry Caretaker.
R. CAHILTY, Brands Inspector.
J. W. MCKINLEY, Foreman, Quilchena Experimental Station.
E. BROOKLAND, Foreman, 105-Mile Experimental Station.

Foul-brood Inspectors:

F. D. TODD, Victoria. W. J. SHEPPARD, Nelson.
L. HARRIS, Vernon.

Women's Institutes:

Mrs. A. BLACKWOOD-WILEMAN, Chairman, Advisory Board, Duncan.
Mrs. A. L. TRASK, Oyama (member).
Mrs. F. B. FADDEN, Huntingdon (member).
Mrs. J. S. CHALMERS, Thrums (member).
Mrs. V. S. MACLACHLAN, Secretary, Advisory Board, R.F.D. No. 3, Victoria.

Accountant:

W. T. ANDREWS.

Clerical:

G. B. MARTIN.
G. L. FOULKES (on active service).
C. P. L. PEARSON.
GEO. PILMER.
R. E. MITCHELL.
J. H. BUCKETT.
G. H. STEWART (on active service).

Publications Branch:

M. A. STUART, Agriculturist and Acting-Editor.

REPORT OF THE DEPARTMENT OF AGRICULTURE.

REPORT OF THE ACTING DEPUTY MINISTER OF AGRICULTURE.

W. T. McDonald, M.S.A.

Hon. E. D. Barrow,
Minister of Agriculture, Victoria, B.C.

Sir,—I have the honour to submit herewith my report for the Department of Agriculture for the year 1918.

I was appointed Acting Deputy Minister of Agriculture on April 10th, 1918, owing to the serious illness of W. E. Scott, who resigned as Deputy Minister of Agriculture on August 31st, 1918.

Agricultural Conditions.

The winter of 1917-18 was fairly severe and was followed by a late spring. There was a very limited rainfall during the early part of the summer over Vancouver Island and adjacent islands, the Lower Mainland, and the Southern Interior, which was responsible for low yields of fall crops over the areas mentioned. In the range districts the conditions appeared very unfavourable for a time owing to the shortage of hay and pasture, but rains in the latter part of summer helped out the fall grazing, while a mild fall and more or less open weather till the end of the year have greatly improved the outlook. In the Central Interior portion of the Province traversed by the Grand Trunk Pacific Railway there was a liberal rainfall, with an abundance of rough feed. Much of the hay produced in this area was more or less injured by rain during the haying season, but, while rendered unsuitable for marketing purposes, an indirect benefit has resulted therefrom owing to the fact that it has encouraged the purchase of cattle, to which it is being fed on the farms. In this section of the Province the winter was extremely late, with the result that some of the grain-crops were more or less injured by early frosts.

As the war progressed the labour problem became more and more acute. This problem was met in the fruit districts by the introduction of girls as pickers, who deserve great credit for the loyal manner in which they did their part to support the efforts made along the lines of increased production.

Campaign for Increased Production.

In the 1918 session of the Legislature an Act was placed on the Statutes which provided for the setting-aside of $50,000 to be used in the purchase of seed-grain, which might be sold on time to farmers where there was difficulty in securing seed-grain locally. In this manner, much land was seeded to crop, which otherwise would have lain idle.

During the spring and early summer the services of G. S. Harris and H. C. Helgesen were secured in connection with the hog-production campaign, and incidentally to encourage dairy production as well. Both of these men have been successful hog-raisers, and their advice proved of great value in the districts which they visited. In this connection the Department decided that, instead of urging farmers indiscriminately to raise more hogs, it would be wise to urge the growing of pasture and other feed for hogs, and thus lower the cost of production. Where conditions appeared to be decidedly unfavourable for hog production, people were advised not to undertake the enterprise. As a result of this kind of a campaign we are satisfied that adequate results were secured without endangering the industry to a reaction which we felt would follow an indiscriminate campaign.

At this time I desire to place on record the patriotic co-operation of the farmers of the Province, who on every occasion nobly responded to the call for increased production.

Land Settlement.

There has been a considerable influx of settlers along the line of the Grand Trunk Pacific Railway in Central British Columbia, and with the cessation of the war we anticipate a rapid development of this portion of the Province. The Peace River District is also attracting settlers, and it is hoped that in the near future this important section of the Province will have railway facilities.

LIVE STOCK.

Horses.—The horse-breeding industry has been at a low ebb in the Province, and owing to the extremely high price of feed during the present winter all surplus horses that could be disposed of were sold in the fall. The result is that the number of horses in the Province now appears to have reached the minimum, and even with the encroaching competition of the tractor we anticipate that towards spring we will see the beginning of a good demand for draught horses of size and quality.

Beef Cattle.—There has been a tendency on the part of some of the largest operators in cattle-ranching to reduce their herds owing to the limited amount of range, but it is confidently expected that, under the new plan of administering the public ranges now being outlined by the Government, a much larger number of cattle can be carried than heretofore. A goodly number of beef cattle have been imported along the Grand Trunk Pacific from Alberta.

Dairying.—Owing to the high price of hay and grain there has been a tendency during the past fall on the part of some dairymen to reduce their herds, and in a few cases herds have been entirely dispersed. Taking the Province as a whole, however, there has been a marked increase in dairying during the year 1918.

Cow-testing Associations are proving an important factor in stimulating a keener interest in the care and management of the dairy herd, and as the work extends the results obtained will demonstrate the advantage to be gained by the dairy-farmers in availing themselves of this opportunity to secure assistance in placing their operations on an up-to-date business basis.

Dairy production has been greatly stimulated as the result of the campaign carried on by the Department for an increased number of silos, and at the present time Ontario is the only Province in Canada that has a greater proportion of silos than British Columbia, and it is expected that within a year or two this Province will stand first.

Hogs.—As the result of the patriotic appeal made at the early part of the year to farmers to raise more hogs there has been a marked increase in the production over that of last year. When the appeal was made the farmers responded in a whole-hearted manner, and on every hand there was evidenced a keen desire to assist in increasing the food-supply along this line.

Sheep.—During the year 1918 there has been an increased interest in sheep production owing to the high prices of wool and mutton that have prevailed. The number of sheep in the Province has shown an increase over the previous year, and this would have been much greater but for the difficulty in securing breeding stock and the high prices prevailing for the same. A large part of the wool produced in the Province is now marketed co-operatively, and the prices on the whole have been extremely gratifying to the grower. The proposed new grazing regulations will undoubtedly stimulate a much greater production of sheep in the Interior of the Province.

Goats.—The year 1918 has marked an important step in the development of this comparatively new industry in our Province. Through the activity of some of our British Columbia breeders a Canadian Goat Society has been organized, and herd-book registration has been established under the supervision of the National Live Stock Records Board. A number of high-priced animals have been imported into the Province from Great Britain and the United States, and doubtless the industry will assume considerable importance in the near future.

Poultry.—The poultry industry has shown no increase during the past year, but this was to be expected owing to the high price of feed that prevailed. Poultrymen who were so situated that it was necessary for them to purchase all of the feed required were particularly affected, but, notwithstanding, many have been able to show very satisfactory results at the end of the season. The situation that has prevailed has had a tendency to induce culling, with the result that the standard of excellence for the Province has been raised by a considerable degree.

VETERINARY INSPECTION.

During the year 15,705 head of cattle were tuberculin-tested, and 568 reactors were found. An effort was made to follow systematic testing of the herds not tested in the year 1917, but owing to the large number of requests for the testing of other herds it was found difficult to carry on the work in a systematic manner with the number of Inspectors on the staff.

There is a continued improvement in the sanitary conditions of the stables and dairies, with a marked tendency to replace old buildings with more modern structures.

HORTICULTURE.

Owing to the good prices prevailing for nearly all classes of fruit, fruit-growers on the whole have had a very satisfactory year. The yield of strawberries was greatly reduced by extremely dry weather at the time the crop was maturing. For the year 1917 the estimated value of the fruit-crop was $2,884,954, while for the past year it reached $4,415,160. The value of the vegetable-crop was almost double that of the previous year.

Statistics gathered relative to the production on city lots, show that the following was produced:—

Vegetables	$ 869,240
Poultry (dressed)	256,666
Eggs	595,448
Rabbits	75,000
Goats	700
Pigs	88,680
Dairy products	314,925
Veal	6,324
Honey	15,529
Total	$2,222,512

The Prairie and Coast Markets Commissioners have been of great assistance to fruit and vegetable growers, as well as to others in the Province, by keeping them in touch with market conditions and giving them information relative to the best methods of marketing their produce.

AGRICULTURAL STATISTICS.

Our Statistician of the Department has had the co-operation of the Dominion Statistician in collecting agricultural statistics of the Province. These statistics show an increase in nearly all lines of agricultural production, and while there is an increase of 10 per cent. in the value of our imports of agricultural products over the previous year, this difference is much more than offset by the increased prices that have prevailed.

AGRICULTURAL JOURNAL.

The *Agricultural Journal* has been in circulation for nearly three years, and during the past year its circulation has increased from 2,500 to 6,000. The effectiveness of this publication in spreading information to farmers throughout the Province has more than justified the undertaking, and is extremely gratifying to the Department.

CORRESPONDENCE.

The correspondence during the past year has shown a very marked increase, and is proof of the increasing use that is being made of the information furnished by the Department. This increase is particularly marked in the case of the Live Stock Branch, where it is approximately 30 per cent. over that of the previous year.

REPORTS OF STAFF OFFICIALS.

Appended hereto are the reports of various members of the staff of the Department, which furnish detailed information regarding the activities carried on by these officials.

All of which is respectfully submitted.

W. T. MCDONALD,
Acting Deputy Minister.

REPORT OF PROVINCIAL HORTICULTURIST AND INSPECTOR OF FRUIT PESTS.

M. S. MIDDLETON, B.S.A.

W. T. McDonald, Esq.,
Acting Deputy Minister, Department of Agriculture, Victoria, B.C.

SIR,—I have the honour to report on the work of the Horticultural Branch for the period from January 1st, 1918, to November 15th, 1918.

OFFICIALS.

The staff has been well maintained considering present existing conditions. P. E. French, B.S.A., Assistant Horticulturist in the Vernon section, resigned on June 15th of this year, after seven years of faithful and valuable service. B. Hoy, Assistant Horticulturist at Kelowna, took over the Vernon territory in addition to his own. Several men have been employed temporarily during the year, mainly on special work in horticulture.

ACTIVITIES.

The work of the Branch has been carried on along the most economical and efficient manner possible. Orchard visits and inspections have been made as far as time and men would permit; orchard records made and reported on current year slips, and this data recorded on our five-year forms; this work was a follow-up on the records gathered during 1916. Many meetings were held and field demonstrations given in different fruit sections of the country. Judging of fruit and vegetables at fall fairs was carried out by our officials in nearly every instance; packing-schools, pruning-schools, and horticultural competitions were arranged and judged; demonstration spraying for the control of apple-scab, apple-tree anthracnose, peach-worm, etc., in co-operation with our Plant Pathologist, the Dominion Entomologist, and University Officials. Assistance was also given to other branches of the Department wherever possible in helping them carry out their work most effectively; inspection for codling-moth in area infested, banding and spraying for its control and eradication; inspection of foreign cars at points of assembly for codling-moth; inspection of and reporting on fruit for export; inspection of potatoes for outside points, and assistance to potato-shippers in proper loading of cars for shipment, etc.; inspection of nurseries; the collecting of fruit and vegetable crop estimates and figures in co-operation with the Statistics Branch of this Department; market-extension work, reporting on condition of markets and fruits and vegetables on arrival; the publishing of a weekly market bulletin at Vancouver and Calgary, giving wholesale and retail prices as well as f.o.b. prices from the main shipping centres, has also been a valuable feature in the work of this Branch. Visits were made to the principal fruit centres in Washington and Oregon by your Horticulturist and the Prairie Markets Commissioner. The Western Washington horticultural meeting at Seattle in February was attended by myself. E. W. White, W. T. Hunter, and myself attended the Western horticulturists' meeting at Corvallis, Oregon, in August, where an opportunity was afforded us of meeting the leading horticultural men from all the Western United States, and great benefits were derived from the splendid addresses there delivered.

CODLING-MOTH SITUATION.

Work has been carried on as usual in the control, and with hopes of eradication, of codling-moth at Westbank and Okanagan Landing as in past years. At Westbank spraying was continued this year in connection with banding the trees, and so far no worms have been found, which is very encouraging indeed.

The work should be continued next year in case of an oversight in inspection and the possibility of re-establishment. At Okanagan Landing the situation last year led us to believe that we had the infestation corralled in two orchards, and, following a very reasonable offer on the part of the owners of these two infested orchards, it was decided to buy the crop and pick and destroy same, to starve the worms if any were found. The banding of the trees was continued and several inspections made during the season, with clean results to report. Unfortunately, fresh infestations were discovered in some of the town-lot trees in Vernon shortly after our other work had commenced. Since then other infestations have been found in lots between Vernon and the Landing. A quarantine has been placed on all the adjoining orchards and the trees banded, and the fruit thoroughly inspected for worms. Owing to the limited area

infected the work of control and hopes of eradication are quite feasible, and this work must go on even though we have failed in our first attempt at its total eradication. The endeavour to keep this serious fruit pest out of our Province is of vital importance when we realize its ravages and enormous additional spraying costs to the growers where it has gained an entrance. It is estimated that it would cost our growers $5 for spraying per acre, and that at least three sprays would have to be applied in order to keep the worm under control. This would mean the great sum of $600,000 for spraying, basing our fruit acreage at 40,000 acres, besides the very considerable loss in fruit and the lowering of grades. It might be mentioned that the losses from the codling-worm in some of our leading fruit sections in the Western States to the south of us suffered losses this year up to 25 per cent. of their crop.

It is felt that the growers in the infested sections should be made to bear more of the expense and to realize the seriousness of the pest and work the Government is doing to help them. Strict supervision and consistent methods and endeavours must be continued if we hope to stamp it out of the Province.

Pear-blight.

The prevalence of this pest is greater in some sections this year than usual, and every effort will have to be made to compel, as usual, growers to thoroughly cut it out during the winter. Much educational work has been carried on by the Branch in past years, so that in the majority of the sections the growers are fairly familiar with the control methods and proper treatment.

Packing-schools.

Forty-four schools were held this year with a total attendance of 656 pupils, 287 of whom were junior class pupils. Many of these schools were held in the larger centres, where additional help in packing and harvesting was expected to come from. A great many of these pupils were women organized under the Y.W.C.A. Many of these pupils went into the fruit sections during the picking and packing season and did excellent work.

Pruning-schools.

There were only four of these schools held this year owing to the lack of suitable pupils, all the young men having left for the Front. These schools are very useful and will prove more popular—a great benefit in the districts in which they are held.

Horticultural Competitions.

Eight farm garden, four city garden, one strawberry, one tomato, and one onion competition were arranged for and judged by the officials of the Branch. These competitions proved very useful and instructive where a good keen competition was worked up. This work has been carried on for four years in many sections and still good interest is being exhibited. This feature of our activities worked well along with the increased-production work in the different cities and districts.

Publications.

It was realized that there was a great demand for a concise, brief, and practical circular dealing with horticultural subjects under British Columbia conditions, and a start has been made on a list of some fifty different subjects in a new horticultural series. Twenty of these have been issued so far.

Conclusion.

My report would be lacking were I not to mention the cheerful assistance rendered at all times by the officials of this Branch in carrying out the work of the Department to the best interests of all during the time your Horticulturist has been in charge, and the hearty co-operation and good-fellowship at all times exhibited by officials in other branches of the Department.

All of which is respectfully submitted.

M. S. Middleton,
Provincial Horticulturist and Inspector of Fruit Pests.

REPORT OF ASSISTANT HORTICULTURIST AND INSPECTOR OF FRUIT PESTS, OKANAGAN, SIMILKAMEEN, BOUNDARY, SALMON ARM, AND CANADIAN PACIFIC RAILWAY MAIN LINE DISTRICTS.

B. HOY, B.S.A.

W. T. McDonald, Esq.,
Acting Deputy Minister, Department of Agriculture, Victoria, B.C.

SIR,—Below is a report of the work done by the Horticultural Branch in the Okanagan, Similkameen, Boundary, Salmon Arm, and Canadian Pacific Railway Main Line Districts for the year 1918.

CHANGES IN STAFF.

Last spring M. H. Chesbro, District Field Inspector for the Kelowna District, resigned and no new appointment was made. P. E. French, Assistant Horticulturist in charge of the North Okanagan and Salmon Arm District, resigned in April and this district was placed under the supervision of the writer in July.

LECTURES AND FALL FAIRS.

Lectures on horticultural subjects were given at Rutland, Glenmore, British Columbia Fruit-grower's Association annual convention at Victoria, Keremeos, Summerland, and Penticton. Fall fairs were attended in the capacity of judge of fruit and vegetables at Armstrong, Summerland, Kelowna, and Rock Creek. Separate reports of these fairs have been mailed to the Department.

The District Field Inspectors assisted the Department with fall fairs and with institutes throughout the district.

FIELD-CROP COMPETITIONS.

The following crop competitions were judged by members of the Horticultural Branch: Potato competitions at Grand Forks, Rock Creek, and Bridesville were judged by Mr. Hunter; farm-garden competitions at Enderby, Grindrod, and Mara and juvenile war-gardens competition at Oyama were judged by Mr. Evans; corn, onion, bean, and tomato competitions at Kelowna were judged by the writer.

PACKING-SCHOOLS.

The policy of holding packing-schools was again continued, and much time was spent by the members of the staff in arranging and organizing these schools in the various districts. The reports of these schools were sent in to the Department at Victoria by the various Instructors at the close of each school.

EXPERIMENTAL AND DEMONSTRATION.

Apple-scab.—The experiments on apple-scab were conducted on similar lines as the two previous years, with the exception that in the "materials" test at Salmon Arm "Sherwin Williams Dry Lime Sulphur" was added to the list of materials being tested. The results of these experiments have been very good and have demonstrated most emphatically that apple-scab can be successfully controlled at a very reasonable cost per acre. A separate report of detailed results has been mailed to the Department.

Aphis Experiments.—Experiments were conducted for the second time at Vernon on the control of green aphis. This work was started with the idea of finding a cheaper efficient spray. Black Leaf 40, 1 to 2,000 with 2 lb. of lime added to every 100 gallons of the mixture, is a much cheaper spray than those in general use, and in the tests made where this spray was used there was 90 per cent. mortality in the aphis.

Peach-worm.—The results of this experiment showed lime-sulphur at a strength of 1-7 applied when the peach-blossoms show pink in colour to be very effective in controlling this pest. The chief thing about this spray is to get it on at the time stated and do a thorough job, driving the spray into all the crotches.

Cover-crops.—Owing to the demand for information on fertilizing of orchards, cover-crop experiments were begun this year at Salmon Arm, Vernon, and Penticton. A small amount of seed of hairy vetch and sweet clover was bought and placed in the hands of some of the most reliable growers by the District Field Inspectors, who supervised the preparation of the ground

and planting. The Inspectors will advise the growers as to the proper methods of handling these cover-crops and keep a record of the results of the work. The time is not far distant when fruit-growers will need the best advice there is in this important phase of orcharding.

Lime Experiment.—To test out the value of lime in the Salmon Arm District on some of the acid soils, six plots were chosen of ½ acre in size on the different soil types. The lime has been applied to three of these and will be applied to the other three in the spring. This work is being done under the supervision of Mr. Barlow, District Inspector at Salmon Arm.

Inspection-work.

Car Inspection.—All foreign refrigerator-cars coming into the valley were inspected at Okanagan Landing for codling-moth. All sweepings from these cars were destroyed by burning. The same sort of inspection took place at Keremeos. One hundred and twenty-two cars were inspected at these two points and twenty larvæ were captured. This work is very important in keeping the country free of codling-moth, as this pest could be easily introduced from this source.

Nursery Inspection.—The Riverside Nursery at Grand Forks, the Kaleden Nursery at Kaleden, Stewart's Nursery at Kelowna, and Smith & Gorham's Nursery at Hullcar were inspected during the summer and the fall. Further inspection will be necessary during the shipping season in the spring at those nurseries where the trees are not taken up until spring.

Peach and Apricot Inspection.—A campaign against the peach-twig borer was started this spring in Summerland, Peachland, Penticton, and Kaleden. Spraying with lime-sulphur when the blossom-buds showed pink was insisted upon by your Inspectors in all peach and apricot orchards. Practically all growers gave their hearty support to this work, and only in the case of absentee ownership did we meet any obstacles. In these instances the orchards were either cut down or sprayed by the Department.

During the shipping season shipments of peaches and apricots were inspected so far as time would permit, with the result that the number of wormy peaches leaving the district was greatly minimized.

The results of the effort and time given to this work was very satisfactory. The good results from systematic spraying was very pronounced.

Codling-moth.—At Walhachin, Vernon, and Westbank the Department has orchards under quarantine for codling-moth. The same policy that was adopted in 1916 was carried through this year in the Westbank work. Two sprays of arsenate of lead were applied, the calyx spray commencing May 20th and the second spray commencing June 20th. Twelve thousand trees were banded and the bands inspected five times during the season. On the third inspection, which commenced on August 6th, three worms were found. Two more inspections followed this, but no signs of the pest were found. Sixteen thousand boxes of apples and 1,200 boxes of pears were shipped from this district and no worms were found in the fruit. The results of the year's work at Westbank is very gratifying, as the following figures show: In 1916, 340 worms were found; in 1917, 58; and in 1918, 3. While no worms were found in the last two band inspections, it is hardly safe to assume that the pest is entirely eradicated, and it would be well to continue the work another season.

The same policy as previously followed by P. E. French was followed through the season at Walhachin. The results here are such that warrant us to assume that codling-moth has been eradicated from this area. No worms were found in either the fruit or bands.

At Vernon the policy adopted in 1916 was, on the recommendation of P. E. French and R. C. Treherne, Dominion Entomologist for British Columbia, changed this spring, and instead of spraying and banding the area under quarantine the apples of about 50 acres were purchased by the Government and picked before maturity and destroyed. Band inspections continued throughout the summer, and in the last three band inspections no worms were found, which warrants us in assuming this area to be free of the pest. While this portion is apparently free of worms, infection has been found in neighbouring orchards. In October worms were found in four properties about one mile north of the quarantined area. These four places aggregate about 15 acres. Quarantine measures were immediately adopted on all of theses places.

A new outbreak was discovered in the town of Vernon this spring and three places were quarantined. Thirteen worms were taken from this area during the summer.

Codling-moth is still a great menace to the orchards in the Vernon District, and stringent quarantine and control-work will be necessary this coming season to prevent this pest from making further headway.

Fire-blight.—A very great deal of your Inspector's time is taken up in the control of this disease. This year no great amount of damage was done, except in the Kelowna District, where the disease was more prevalent than in any previous year. Your Inspectors have pointed out to all growers the very serious nature of this disease and the urgent need of cutting it out thoroughly. They have also endeavoured to locate all infected orchards. As the control of this disease is a community problem and depends entirely on each man thoroughly cutting out the diseased portions of his trees, all Inspectors are instructed to keep in touch with the work being done in blight-infected orchards, and where necessary to take effective steps to see that the work is done.

San Jose Scale.—The control-work done on this pest at Spences Bridge has apparently eradicated it from the orchards, but the scale was found on wild growth near the orchards this spring. This growth was grubbed out and burned, with the result that no traces of the insect were found this fall. It is not safe to assume from this that the scale is eradicated, so this work will be followed up closely by close inspection and thorough spraying by the growers.

Woolly Aphis.—This pest is on the increase and is difficult to combat. In 1917 a small experiment was conducted at Kelowna with various sprays to combat this pest. This year a more extensive experiment was carried out under the supervision of R. C. Treherne to find out the best means of combating this pest.

Wireworms.—These worms were very much in evidence this year and did considerable damage in onion and potato fields. Extensive study of the habits of this pest and means of control was carried on by Mr. Treherne during the summer.

Grasshoppers.—Grasshoppers were not as plentiful this year as in 1917. As a result of the demonstration in the control of this pest conducted by the Department in 1917 nearly all growers were prepared to combat this pest.

Onion-thrip.—Many crops of onions were materially reduced by the ravages of this insect. A few growers attempted spraying, but it was only done in a very crude way and the results were not very satisfactory. Preparations are being made now by some of the growers to combat this pest in a thorough manner next year.

Onion-maggot.—More onion-fields were attacked by this pest than in any previous year. Some demonstration-work on methods of control was carried on by the Entomological Branch, but was not started early enough to get the desired results.

Pea-weevil.—This year pea-weevil was found in Kelowna and Summerland. This pest has apparently gained entrance to the valley by growers bringing in small amounts of seed from the Prairie. All infected material found has been treated in such a manner as to kill all insects.

Export Fruit and Vegetables.—The shipments of fruit and vegetables was not, owing to the embargo put into effect in Great Britain and Australia in the early part of the season, as large as in some previous years. Considerable attention during the shipping season is given to the inspection and issuing of certificates for this fruit. Practically no potatoes were exported from this district this year. A few hundred pounds were sent to China and one car to the United States.

STATISTICAL WORK.

Crop estimates were made in the spring by your Inspectors and mailed to the Department. Figures on the tonnage of fruit and vegetables shipped out and handled by the canneries and evaporators have been collected and forwarded to the Department.

GENERAL WORK OF BRANCH.

The same general policy as followed in previous years was carried out this year. Your Inspectors have at all times been at the service of the growers, and a very large portion of their time has been devoted to helping them solve various problems confronting them. This work is done by consultation in the office, by telephone, mail, and by personal visits, where things are talked over in the field. This kind of work, though absorbing a great deal of time, is very much appreciated.

During the shipping season the Inspectors are called upon by the shippers and growers to advise *re* shipments and various diseases and pests.

Respectfully submitted.

BEN HOY,
Assistant Horticulturist and Inspector of Fruit Pests.

CODLING-MOTH CONTROL IN VERNON AND OKANAGAN LANDING DISTRICTS, 1918.

Dates and Material taken on Fruit- and Band-inspection Work in Various Orchards.

G. Mickleborough, about 35 Acres.—Band inspections: First, July 15th to 22nd, 4 larvæ, 5 pupæ; second, July 27th to August 3rd, 1 larva, no pupæ; third, August 14th to 18, no larvæ, 2 pupæ; 4th, August 28th to September 4th, none; fifth, September 27th to October 3rd, none; sixth, November 13th to 16th, none. Totals, 5 larvæ, 7 pupæ.

J. Mutrie, about 15 Acres.—Captured in apples between June 22nd and August 9th, 90 larvæ; over-wintering material captured May 10th to 21st, 2 larvæ, 6 pupæ. Totals, 92 larvæ, 6 pupæ.

The above are records on the area on which fruit was bought and destroyed before maturity.

J. Mutrie, about 25 Acres.—Band inspections: First, August 15th to 20th, none; second, September 10th to 15th, none; third, November 8th to 13th, 4 larvæ. Captured in apples between October 24th and 29th, 3 larvæ. Total, 7 larvæ. Nothing was found in the above during 1917 or previous to October 19th, 1918.

J. Wylie, about 15 Acres.—Band inspections: First, August 15th to 20th, none; second, September 10th to 15th, none; third, October 19th to November 12th, 34 larvæ. Captured in apples between October 30th and November 5th, 5 larvæ. Total, 39 larvæ. Nothing was found in the above during 1917 or previous to October 19th, 1918.

In the Vernon Town outbreak, comprising about 2 acres on four different properties, 3 band and fruit inspections resulted in the capture of 7 larvæ and 6 pupæ. Lot-owners: J. Blunden, L. O. Bunville, Mrs. Wright, and Mr. Boyd.

A new infestation was located on October 11th, 1918, at Okanagan Landing on an area totalling about 17 acres on four different properties. No banding was done, but all shipping fruit was inspected, all worm-marked apples and windfalls being destroyed. Owing to shortage of labour and pressure of work at this time, it was not possible to make actual count of captures, but it can be safely assumed that all of 200 worms were destroyed. Owners of the above lots are: Mrs. C. O'Keefe, 6 acres; R. Swift, 6 acres; T. Flemming, 2 acres; T. S. McClennan, 3 acres.

REPORT OF ASSISTANT HORTICULTURIST AND INSPECTOR OF FRUIT PESTS, VANCOUVER ISLAND AND LOWER MAINLAND DISTRICTS.

E. W. White, B.S.A.

W. T. McDonald, Esq.,
Acting Deputy Minister, Department of Agriculture, Victoria, B.C.

Sir,—Owing to the fact that at the present time there is no Provincial Horticulturist, I beg to submit herewith to you my annual report as Assistant Horticulturist and Inspector of Fruit Pests for Vancouver Island and the Lower Mainland for the year 1918.

Orchard-renovation Work in the Fraser Valley.

During the last days of 1917 a most severe ice-storm visited the Fraser Valley and caused a great deal of damage to orchards, small-fruit plantations, native and ornamental trees, telephone, telegraph, and electrical wires. The area affected extended roughly from Langley Prairie to Rosedale on the south side of the Fraser River and from Agassiz to Ruskin on the north side of the river.

Peculiar atmospheric conditions were responsible for the storm. On December 24th and 25th the weather was bright and clear and somewhat frosty. On December 26th rain began to fall into a ground temperature of 4 to 8 degrees of frost, which of necessity caused the rain to freeze where it fell. Ordinarily this precipitation should have fallen as snow, but owing to a very strong Chinook west wind that was blowing in the upper atmospheric regions it was not congealed and consequently fell as rain. As evidence that this Chinook wind was blowing, it may be stated that before the storm the mountains in the Chilliwack District, from Mount Cheam west, were all covered with their winter fall of snow, and after the storm subsided there was practically no snow to be seen on the mountains surrounding the valley. The rain continued to fall and freeze for three days, and when the storm subsided on December 30th it was estimated that there was practically 8 inches of solid ice on the ground.

Your assistant paid a visit to the Chilliwack District on January 3rd, going in on one of the first Canadian Northern Railway trains to get through. A preliminary survey was made of the damage done and a report submitted on January 15th.

During the first week of February another visit was paid to the district in company with M. S. Middleton, Provincial Horticulturist, and a decision was reached as to the manner in which the Government, through its Horticultural Branch, could be of the greatest assistance to the owners of orchards. It was decided that a force of expert pruners under the direction of your assistant should be employed, who would visit each individual grower and advise him as to which course was the wisest for him to pursue.

The weather was so unsettled during the early part of the year that it was impossible to start work until the first week in March. The following men were then employed: C. R. Barlow, District Fruit Inspector for the Salmon Arm District, was loaned for the work from March 4th to March 19th; K. W. Munson, of Vancouver, and late of the Rogue River Valley, Oregon, a practical horticulturist, was engaged on March 6th and continued throughout the spring, and later carried out the duties of District Field Inspector for the Fraser Valley; A. Smith, of New Westminster, a practical horticulturist, was employed from March 18th to March 30th. These men were employed chiefly in the Chilliwack section. T. H. Bain, of Vancouver, at various times attached to the Provincial Department of Agriculture and the Dominion Fruit Inspector's office, was employed in the Mission-Hatzic District from March 21st to May 23rd. The work that these men were able to accomplish was greatly appreciated by all those concerned, and consisted chiefly of a personal visit to each grower, enough time being given to actually advise him which trees could be repaired and which should be removed; methods of pruning, wiring, and bolting split trees; methods of top-working and grafting and the best varieties to use. These men did not simply look on and give advice, but actually got in and did the work themselves, a condition being, however, that the grower himself had to be on the spot to help and give all assistance possible.

Demonstrations in grafting were held later in the spring, and the work accomplished was very successful. In one orchard in Chilliwack Mr. Munson set over 2,500 grafts, all of which took, with the exception of about fifty.

SMALL-FRUIT PLOT, CHILLIWACK.

This demonstration small-fruit plot was planted out under the supervision of the Horticultural Branch in 1912, and remained under its control until April, 1917, when the lease expired. In 1917 it was managed by the owner, A. Johnson. In 1918 K. W. Munson, who was employed by the day by the Horticultural Branch as District Field Inspector, was given permission to rent this plot and to handle it for his own benefit, taking such time off, without remuneration, as was necessary for the proper management of the undertaking. For this privilege Mr. Munson agreed to furnish the Horticultural Branch with a complete report at the conclusion of the year. This report was furnished and appeared in full in the December issue of the *Agricultural Journal*.

While the venture proved a financial success to Mr. Munson, still it was really a patriotic impulse and a desire to prove his unbounded faith in the suitability of the district for the production of small fruits that prompted Mr. Munson to undertake the management of the plot. Despite the fact that the very high rental of $112.50 per acre was paid, 2 acres of Evergreen blackberries returned $1,323.15 net, ¼ acre of loganberries returned $100.74 net, ¾ acre of raspberries returned $191.45 net, and ½ acre of Snyder blackberries showed a loss of $1.27 net. This should demonstrate conclusively that the right varieties of small fruits, planted in the proper location, will prove very profitable under proper management.

CONCLUSION OF THE PEAR-THRIPS WORK IN SAANICH.

This work, which was instituted in 1916, following the severe outbreak of pear-thrips in 1915, and which was continued in 1917, was practically completed in 1918.

In the spring of 1918 a complete bulletin on the subject, prepared by R. C. Treherne and Dr. A. E. Cameron, Field Officers of the Dominion Entomological Branch, was published by the Dominion Department of Agriculture. During the spring and summer further notes on the life-history were kept by W. Downes, assistant to Mr. Treherne in this district.

The operations of the Horticultural Branch were limited. Of the three power-sprayers in use in 1916 and 1917, the one located at Royal Oak was sold to T. A. Brydon & Sons, who undertook all their own spraying. The Gordon Head sprayer was moved to town and completely

overhauled, and later removed to Keating, where it was placed at the disposal of a number of the growers. This movement was necessary because the Keating machine broke down and it was necessary to bring it to Victoria for overhauling, after which it was stored in anticipation of any emergency.

The pear-thrips, while they appeared in very considerable numbers, were not as serious as in 1915-16-17, and were held in check where the recommended sprays were used.

Meetings, Press Articles, and Department Publications.

During the spring several meetings were addressed, principally on the subject of gardening. Various articles were prepared during the year for the agricultural press and the Department's *Agricultural Journal*. In April Circular Bulletin No. 6, "Gardening on a City Lot," was revised and issued as Circular No. 43, "Gardening on a City Lot," of the new horticultural series. Circulars on the various small fruits are in course of preparation at the present time.

Horticultural Competitions.

During the summer your assistant was called upon to judge all the competitions held in this district. Keen interest was displayed in all the competitions, and it is believed that they do a great deal towards stimulating greater activity in the lines for which they are held.

The following is a list of the competitions judged by your assistant and the number of entries in each:—

Place.	Competition.	No. of Entries.
Victoria	Home garden (Class A)	23
"	Vacant-lot garden (Class B)	30
"	Professional garden (Class C)	11
"	Children's garden (Class D)	3
Ward IV., Saanich	Cottage garden	23
Ward VII., Saanich	"	15
Metchosin	Farm garden	10
Gordon Head	Strawberry	10
Coquitlam	Farm garden	10

Fall Fairs.

The following fall fairs were attended by your assistant in the capacity of judge of fruit and vegetables. At some of the fairs K. W. Munson assisted with the judging. The fairs attended were as follows: Central Park, Mission City, Agassiz, Maple Ridge, Langley, Aldergrove, Coquitlam, Burquitlam, Surrey, and Matsqui.

R. C. Abbott and K. W. Munson judged the Chilliwack Fair, and Mr. Abbott also judged the fruit at Aldergrove.

At the Vancouver Fair the Horticultural Branch conducted demonstrations in grafting and budding in connection with the Department's information booth. Specimens were shown illustrating the results of our work in the Fraser Valley last spring following the severe ice-storm. K. W. Munson conducted the majority of the demonstrations, which were largely attended.

At the Chilliwack Fair Mr. Munson put on a practical demonstration in box-making and fruit-packing, which was much appreciated by the fruit-growers who attended, and much valuable information was disseminated.

At the Home Products Fair in Victoria Mr. Munson again demonstrated grafting and budding at the Department's information booth, and a large number of city people were keenly interested.

Your assistant also attended the North and South Saanich Fairs, and assisted Professor F. M. Clement with the judging of the district exhibits. A complete report on the fairs has been submitted.

Experimental Spraying.

(1.) *Keating.—Re* control of black-spot canker or anthracnose. The two applications of Bordeaux mixture were again applied to the experimental block at Keating. This completes the third year's spraying, and as soon as the counts are made in the spring of 1919 by J. W. Eastham, Plant Pathologist, a complete report on the three years' work will be available.

It has been demonstrated, however, that an early application in September of a weak Bordeaux mixture (3-4-40) to late varieties of apples while the fruit is still on the tree is feasible, and that it will control black-spot canker almost completely. A late spray of (6-6-40) Bordeaux applied to the same varieties after the fruit is picked and after the fall rains have commenced is almost useless.

(2.) *Chilliwack.—Re* control of the flea-beetle on turnips. In the early summer of 1918 a very severe infestation of flea-beetle occurred on turnips in the Chilliwack District. The Horticultural Branch enlisted the co-operation of the Soil and Crop Division, in that one of the recently purchased potato-sprayers was loaned, and K. W. Munson conducted some experiments in an endeavour to control the flea-beetle. However, by the time the sprayer was available two early plantings of turnips had been destroyed. The experiments were not altogether satisfactory owing to the late date and the extremely dry weather. The third planting of seed took from two to three weeks to germinate, and the plants were weak when they appeared above ground. Five plots were sprayed once, two plots twice, and one three times.

From the results that were evident, Mr. Munson is confident that the spray formula used—namely, Bordeaux mixture (4-5-40) plus arsenate of lead 6 lb. to 100 gallons—will control the flea-beetle if the turnips are planted early and kept covered with the spray during the first part of the season.

Inspection of Nurseries.

This work was carried out according to the regulations in so far as it was possible. Inspections were made at all the principal nurseries at digging-time and again at shipping-time. There are only two main producing nurseries in operation at the present time—namely, the Layritz Nurseries, Victoria, and the British Columbia Nurseries at Sardis.

There has been a greatly increased demand for nursery stock during 1918, and the probabilities are that the stocks on hand will be completely sold out by the spring of 1919.

Insect Pests and Diseases.

In many ways the season has been very favourable as regards fruit pests. The strawberry-root weevil has again caused very considerable loss to the strawberry-growers of Gordon Head and Keating. W. Downes, of the Dominion Entomological Branch, stationed in Victoria, has continued his studies on the life-history of the insect and has obtained some valuable information. We feel confident that if the growers will adopt our recommendations they will be able to hold the weevil in check, so that profitable crops may be produced.

No work was undertaken in regard to the black-currant bud-mite infection in the Duncan District, nor the codling-moth infection in the Victoria District, both infections having been practically eradicated.

Tent-caterpillars were a very serious pest in uncared-for orchards and in waste places. This pest can be easily controlled if proper preventive measures are used. Other common insects were of about the same severity and did not cause undue damage.

Late blight was again serious on the Lower Mainland, and spraying for this disease became general. An incentive to this work was given this year by the Soil and Crop Division, who operated several potato-plots. The results from spraying were very marked.

Apple-scab was less prevalent this year than for a number of years, it being a very favourable year for the production of clean fruit. The dry weather during April, May, and June was unfavourable for the development of scab.

Other diseases were of about normal severity and did not cause undue damage where proper remedial measures were adopted.

Fruit and Vegetable Production.

Climatic conditions were again more or less unusual and were not conducive to maximum crops. April was characterized by having more than normal sunshine, frequent cold nights, average temperature, drying winds, and unusually light rainfalls. The precipitation was the lightest for a number of years. The month of May was cold and windy, with a notable deficiency in both sunshine and rainfall. As a consequence of the cold nights, lack of adequate sunshine and moisture, the growth of all vegetation was slow and unsatisfactory. June was very hot and dry, with practically no precipitation. The growth of all crops was retarded by the lack of moisture and the dry, hot winds.

These three unusual months were extremely trying on the strawberry-crop in Gordon Head and Keating, and resulted in a somewhat reduced crop. The shipments for 1918 were fifteen cars or approximately 12,000 crates, while nearly 200 tons of berries were disposed of to the jam-factories. Prices were extremely good, and prospects are that they will be very much better in 1919.

Tree-fruits were an average crop, some varieties being off-bearing. Olivet cherries were an excellent crop and again brought good prices. Vegetable-crops looked poor during the summer, but picked up remarkably well during the fall months.

On the Lower Mainland the raspberry-growers had a very successful season and prices were good. Practically the total shipments to the Prairies were made L.C.L. A portion of the crop was lost, due to wet weather and the ravages of the mosquito pest. Blackberries were a poor crop in the Mission-Hatzic District, but at Chilliwack they did exceptionally well.

Apples were light owing to the damage done by the ice-storm, but the quality and cleanliness were much superior to former years. Pears and cherries, however, were extremely heavy, but prunes were almost a total failure. While the year was unfavourable, vegetable production showed an increase over the previous year.

Fruit and Vegetable Crop Statistics.

A god deal of time is required in the fall months to gather the fruit and vegetable statistics for A. B. Tweddle, Statistician. Reports on manufactured products are also secured from all the canneries, jam-factories, and evaporators.

Demonstrations and General Work.

A large number of demonstrations in the various branches of horticultural science have again been given in all parts of the district this year. As a matter of fact, a number of personal calls have had to be omitted owing to the lack of time. This line of work takes up an increasing amount of time, but is very valuable and much appreciated by the growers.

Visits to Washington and Oregon.

During the first week of July your assistant had very great pleasure in accompanying M. S. Middleton, Provincial Horticulturist, on a trip of inspection to the commercial raspberry and blackberry sections of Puyallup and Sumner, Washington. The Western Washington Experimental Station at Puyallup was also visited. A great deal of valuable information regarding small fruits was secured, which was of great assistance in meeting the problems of our own small-fruit growers.

During the first two weeks of August your assistant again accompanied Mr. Middleton to Corvallis, Oregon, where the first annual meeting of Western horticulturists was held at the Oregon Agricultural College. Representatives were present from the Western States of Washington, Oregon, California, Idaho, Montana, and from the Province of British Columbia. An exceedingly valuable three-day convention was held, as practically all the leaders of Western horticulture were present.

The great loganberry district of Salem, Oregon, was also visited. On the return trip occasion was taken to visit the cranberry-bogs of Long Beach and Ilwaco, Washington. A great deal of valuable information was secured on this trip to Washington and Oregon.

Correspondence and Office-work.

This work has taken up an increasing amount of time, especially since November 16th, when M. S. Middleton resigned his position as Provincial Horticulturist and Inspector of Fruit Pests. No appointment being made to fill the position, the work of the office has of necessity fallen upon your assistant.

All of which is respectfully submitted.

E. W. White,
Assistant Horticulturist and Inspector of Fruit Pests.

REPORT OF ASSISTANT HORTICULTURIST AND INSPECTOR OF FRUIT PESTS, EAST AND WEST KOOTENAY DISTRICTS.

E. C. HUNT, B.S.

W. T. McDonald, Esq.,
Acting Deputy Minister, Department of Agriculture, Victoria, B.C.

SIR,—I beg to submit herewith my annual report as Assistant Horticulturist and Inspector of Fruit Pests on the work in the above districts for the year 1918.

PACKING AND PRUNING SCHOOLS.

During the early part of the year fruit-packing and pruning schools were organized. Packing-schools were held at the following places: One each at Nelson, Harrop, Creston, and Kaslo, and two at Nakusp. Four of these schools were held for the boys and girls attending the public and high schools.

The demand for pruning-schools was not so great this year as in the past, on account of so many of the fruit-growers and orchard-helpers of the district having now been pupils of these schools. However, three schools were conducted—one each at Creston, Wynndel, and Robson—for the boys and girls of the high schools.

As a whole, all the schools were well attended and a great deal of interest shown by the pupils taking part. A full report on each school was sent in to the Department at the time the schools were held.

HORTICULTURAL COMPETITIONS.

In 1918 there were held in this district by the Department six horticultural competitions of various kinds. These competitions were judged from two to three times during the season. The greater portion of the time during July and August was spent on this work. The details of the scores in connection with these competitions have been submitted. Keen interest was taken in all the competitions, and some of the gardens were a credit to any district and showed that great pains had been taken in their preparation and care.

The following is a list of the competitions judged and the number of entries in each:—

Place.	Kind of Competition.	Number of Entries.
Nelson	City garden	18
"	War garden	8
Natal	City garden	22
Shirley	Farm garden	11
Willow Point	"	13
Baynes Lake	"	10
Thrums and Shoreacres	"	12

Other competitions judged during the year were the potato and mangel competitions conducted in this district by the Soil and Crop Division. These were held by the Farmers' Institutes at the following places: Cranbrook, Newgate, Crawford Bay, Edgewood, and Thrums-Shoreacres. Scores and report of each have been submitted.

EXPERIMENTAL WORK.

The experimental work conducted this year included principally spraying experiments for the control of apple-scab. These experiments were duplicates of those carried on in 1916 and 1917 at Nelson, Creston, and Edgewood, the third and last year of the three-year test-plots for scab-control with the different strengths of lime-sulphur. The results obtained this year were, on the whole, very successful, as may be seen from the following summary of the experiments:—

Experiments conducted on the same plots and trees as in 1916 and 1917. All trees of full bearing age. Variety, McIntosh Red.

Table of Plots and Sprays (L.S. = Lime-sulphur).

Time of Spray.	Plot 1.	Plot 2.	Plot 3.	Plot 4.	Plot 5.	Plot 6.	Plot 7.
Delayed dormant	L.S. 1-25	L.S. 1-25	.....	.....	.....	.....	Check.
Pink	L.S. 1-30	.....	L.S. 1-30	L.S. 1-30	L.S. 1-30	L.S. 1-30	"
Calyx	L.S. 1-35	L.S. 1-35	L.S. 1-35	L.S. 1-35	L.S. 1-35	L.S. 1-35	"
14 days later	L.S. 1-35	L.S. 1-35	L.S. 1-35	L.S. 1-35	.....	.....	"
14 days later	L.S. 1-35	L.S. 1-35	L.S. 1-35	.....	.....	L.S. 1-35	"

The following table gives the results of the fruit-counts made on the McIntosh Red at Nelson, Creston, and Edgewood. In making the counts, all apples on one uniform tree in each plot were carefully examined and notes taken on the scab.

Plot.	No. of Apples counted.	Fruit free from Scab.	Scabby Fruit.	Culls on Account of Scab.	Total Marketable Fruit.
		Per Cent.	Per Cent.	Per Cent.	Per Cent.
Nelson					
1	106	93.4	6.6	None	100.0
2	100	35.0	65.0	"	100.0
3	137	54.7	45.3	"	100.0
4	106	52.5	47.5	"	100.0
5	117	17.0	83.0	2.5	97.5
6	123	64.3	35.7	None	100.0
7, check	136	None	100.0	47.5	52.5
Creston—					
1	552	99.8	0.2	None	100.0
2	1,021	99.9	0.1	"	100.0
3	1,458	99.9	0.1	"	100.0
4	1,831	99.4	0.6	"	100.0
5	1,558	99.3	0.7	"	100.0
6	983	99.5	0.5	"	100.0
7, check	1,037	70.3	29.7	12.0	88.0
Edgewood—					
1	1,267	94.0	6.0	0.2	99.8
2	476	99.5	0.5	None	100.0
3	224	96.8	3.2	"	100.0
4	934	88.0	12.0	0.5	99.5
5	737	39.6	60.4	0.8	99.2
6	401	81.3	18.7	0.8	99.2
7, check	210	7.6	92.4	17.6	82.4

From these results it can be easily seen that fruit can be produced commercially free from scab, even the most susceptible varieties, by the application of lime-sulphur at the above strengths. The number of sprays to be applied will depend a great deal on the season. From the above results it would seem that three sprayings—pink, calyx, and one later—thoroughly applied would control scab in any normal season. A full report, giving in detail the work done and results obtained from the experiments, has been submitted to J. W. Eastham, Provincial Plant Pathologist.

Dust-spraying with sulphur for the control of apple-scab was carried on at Willow Point for the first time this year; this experiment being in charge of Professor F. M. Clement, of the University of British Columbia. Four applications of the sulphur were applied to the trees during the scab-infection season; assistance being rendered to Mr. Clement from time to time with this work.

Demonstration of Cover-crops.

With the view of keeping up and improving the fertility of orchard soils, a few demonstrations of cover-crops were started this fall. These demonstrations are being carried on at Sunshine Bay, Willow Point, and Birchbank. Spring (common) vetch and fall rye are the cover-crops that are now being tried out. A mixture of vetch and rye was sown at Birchbank and Willow Point, while at Sunshine Bay vetch alone was sown. These crops have done as

well as could be expected. Data is being kept on their adaptability, cost, and their qualities as a soil-builder. Winter-vetch seed could not be secured or some demonstration of cover-crops with it would have been started also.

DEMONSTRATION AND EXPERIMENTAL ORCHARDS.

A certain amount of supervision to the orchards at Birchlands, Waldo, Wardner, and Rossland was continued in 1918. These orchards were pruned in the spring and a considerable replanting was done in the Waldo and Wardner orchards; all the injured trees were replaced by the Department with suitable hardier varieties, and the orchards turned over to the owner in as good a state as possible; the five-year agreement between the owner and the Government having now terminated. The replaced trees ordered for the Rossland orchard did not arrive last spring, so it will be necessary to make the replacements in the spring of 1919 before this orchard is turned over to the owner.

FALL FAIRS.

In September and October fall fairs were attended in the capacity of judge of fruit and vegetables at the following places: Fruitvale, Trail, Nelson, Natal, Creston, and Cranbrook. A separate report on each fair with a marked prize-list has been submitted.

SURVEY-WORK.

During the winter months and at times when the weather was unfavourable for field-work, your assistant was compiling data from the orchard-survey reports that were collected in 1916. This work will be completed by the end of this year, and from these records considerable useful information can be had on the different orchards in the district.

DISEASES AND INSECT PESTS.

Apple-scab.—This disease was not so prevalent in 1918 as in previous years. A very late scab-infection, however, occurred this year on some of the most susceptible varieties. This was due to the wet and muggy weather in August, which is unusual for this district. The results that have been obtained from the scab experiments conducted in the district for the past two years have convinced many growers who had become discouraged that scab was a controllable disease. As a consequence, where growers have adopted proper spray measures in the control of scab (which is now quite general throughout the district) a high percentage of clean fruit has been produced.

Fire-blight.—This very serious disease was found in only one place in the Kootenay District in 1918; it showing up in six different orchard lots in the City of Nelson. All the infections were confined to pear-trees—about twenty trees in all affected. The different infections are well under control and located, so that the hold-over cankers can be easily cleaned up during the dormant season.

Oyster-shell Scale.—This insect is found to be quite bad in some of the old and neglected orchards at different points within the district. The insect has not become a serious pest in the well-managed orchards and can quite easily be controlled by spray measures recommended by the Department.

Cutworms.—Cutworms have been a very serious pest in most all sections of the district. They occurred in great numbers, causing a great deal of trouble and damage to the growers of garden-truck and field-crops.

Potato-diseases.—Potato-diseases are on the increase, the most common ones being common scab, late blight, *Rhizoctonia*, and *Fusarium* wilt. These will require careful attention in the future in the way of longer rotations of crops, the planting of better seed, and the adopting of seed-treatment and seed-selection methods that have been recommended by the Department.

Other Insect Pests and Diseases.—The following other insects and diseases that caused more or less trouble and in some cases considerable damage to the fruit and vegetable crops might be mentioned: Green aphis, cabbage and onion maggots, cabbage-worms, pear-leaf blister-mite, peach-leaf curl, apple anthracnose, and many other minor ones.

All of the above insect pests and diseases were attended to as far as possible by making personal calls on growers and giving advice and information on the methods of control and eradication.

Orchard Visits and Demonstrations.

Personal visits to many different orchards of the district were made during the year; many requests coming in from growers for demonstrations and advice on various horticultural subjects. This line of work takes up a great deal of time and is much appreciated by the growers.

Crop Reports.

Crop estimates and reports are furnished from time to time during the growing season, and at the end of the year a detailed report is made of the total production of all fruits and vegetables in the district. Information and data is also collected in a similar way from the jam-factories of the district.

Office-work.

Office duties, although on the increase, were much the same as in previous years. The necessary correspondence and other duties were attended to.

All of which is respectfully submitted.

E. C. Hunt,
Assistant Horticulturist and Inspector of Fruit Pests.

REPORT OF DISTRICT FIELD INSPECTOR, LOWER MAINLAND DISTRICT.

K. W. Munson.

E. W. White, Esq.,
Assistant Horticulturist, Department of Agriculture, Victoria, B.C.

Sir,—I beg to submit herewith my annual report as District Field Inspector for the Lower Mainland District for the year 1918.

Pruning.

The severe ice-storm in the Chilliwack District in the month of January, 1918, was unprecedented in the history of that section. Cottonwood, fir, and cedar trees were nearly stripped of limbs, leaving only rugged appearing spars throughout the valley and foot-hill area. Fruit-trees were bent and broken to the ground by tons of ice. Trees of the open-centred (vase-shaped) type were in most cases split through the trunks to the ground. Those of the modified-leader and central-leader type, however, were not severely damaged.

About March 1st the Horticultural Department thought it necessary to assist the fruitmen and owners of family orchards in this section in reclaiming the trees, which many owners were inclined to take out by the roots. Mr. Barlow, of Salmon Arm, A. Smith, of New Westminster, and your Field Inspector were employed to assist with the work under your supervision.

On March 6th to 9th a general survey was taken of conditions and a plan outlined of the work to be done. From March 9th to April 4th this crew of men visited the majority of fruit-growers and farmers of this section. An hour or two was spent with some, and as much as three days of practical pruning and instruction given to others. The time spent in this practical and instructive work was determined by the number of trees owned by the individual. The commercial-fruit men were given more assistance in order to encourage the continuation of the industry. Each benefactor was told of the pruning, spraying, and thinning methods in vogue in the large commercial-fruit districts. A spirit of friendliness was shown us, with very few exceptions, and our instruction accepted with welcome.

A. Arnold, Sardis; P. W. Cronkshaw, Sardis; J. Higginson, Sardis; J. Orr, Chilliwack; W. Hodgins, Chilliwack; and many others were the fruit-growers given from ten to fifty pruning-hours each. Several hundred farmers with family orchards were also benefited.

The crew of four pruners at times worked together, and at times separately in different sections. The grower in either case was always asked to be on the job to hear the whys and hows of the demonstration.

Hundreds of seemingly impossible trees to save were brought back into shape with block and tackle, bolted and cross-bolted through the trunk, double cross-wired across the top, using telephone-wire and screw-eyes, and severely pruned back to eliminate side sway and saved to make sturdy trees.

The work of the ice-storm and crew of pruners did unlimited good in showing the farmer and fruit-grower the advantage of keeping the trees well open to sunlight to make clean, profitable fruit.

GRAFTING.

Many undesirable varieties of apple and pear trees were sold into this district untrue to name previous to the "Bonding of Nurserymen Act."

The ice-storm having reduced the fruit-bearing capacity of many fine trees down to nothing, made the spring of 1918 an ideal time to top-graft these undesirable varieties to apples commercially adapted to this district.

A notice was placed in the local Chilliwack paper offering assistance and instruction. Practically the same territory was covered, demonstrating grafting as in pruning. Mr. Stringer's 5-acre orchard of some 300 trees (apple and pear) were top-worked to Yellow Transparent, Devonshire Quarrenden, York Imperial, and Bartlett pears.

About 2,500 scions were set in this block alone, with a loss of less than 2 per cent. The grafts in this block made an average growth of 40 inches during the past growing season. Three seasons more and the trees will be as large as before wrecked by the storm.

Intermingled with the grafting-work, and following it, assistance and instruction was given in the three sprays for apple-scab.

CROP REPORT.

To acquire a complete crop report it was necessary to canvass the entire district, visiting not only the fruit-growers, but farmers with gardens and family orchards. An estimate as near as was possible was made of the individual production for 1917, as well as 1918, as well as the number and kinds of fruit-trees planted.

FLEA-BEETLE EXPERIMENTS.

In the summer of 1918 a large percentage of the field turnips were destroyed by the flea-beetle. Very late in the spring of 1918, after two early plantings of turnips had been destroyed by the flea-beetle, we started a series of experiments. Owing to the late date and the extremely dry weather throughout the summer the experiments were not entirely satisfactory. The turnip-seed took two to three weeks to germinate, and after seed-leaves broke through the ground the plant had no vitality to resist even a small percentage of damage by the flea. Five plots were sprayed once, two plots twice, and one plot three times.

From results that were evident, the spray formula, Bordeaux 4-5-40 plus arsenate of lead 6-100, the writer thinks will give satisfactory results if the turnips are planted early.

The first spray should be applied with good pressure when the seed-leaves are breaking through the ground, eight to ten days intervening between each of the second and third sprays.

PRACTICAL DEMONSTRATIONS.

The writer made practical demonstrations in budding and grafting at the Vancouver Fair, August 22nd, 23rd, and 24th, and at the Victoria Industrial Fair, October 4th and 5th. The interest shown by the public gave ample proof that practical demonstrations in all the industrial agricultural branches should be carried on by the Department each year at all the larger fairs in city or community.

A fruit-handling demonstration was held in a large tent at the Chilliwack Fair, September 18th, 19th, 20th, and 21st. Practical, modern methods of packing, box-making, picking, etc., were shown to the keen interest of the public.

JUDGING FAIRS.

Judging of fruits and vegetables was carried on at ten of the Lower Mainland agricultural fairs. The exhibits at these fairs were good, but from an educational standpoint there is room for betterment; also lack of co-operation between smaller districts was evident. In many sections small, out-of-class fairs could be combined with a neighbouring community, and one good, well-attended fair could be a success educationally, industrially, and financially.

The exhibits of commercial packed fruits, especially apples, were small in number and poorly packed. With few exceptions the antiquated square pack was used. It is advisable that not only exhibitors of packed apples and pears for next year's fairs, but also commercial growers write the Department of Agriculture for pamphlet on "How to pack Apples and Pears."

General Work.

A number of individual demonstrations; personal calls given to persons inquiring for information; general boosting and assistance given in plotting and planting vine-berries; inspection of nursery stock; acquiring greenhouse reports for the Lower Mainland; and getting crop reports for Lower Mainland District outside of Chilliwack section, details some of the work which was done in addition to headings throughout this report.

Conclusion.

The commercial production of small fruits should be boosted and encouraged to 500 acres in the Chilliwack-Sardis District.

The Lower Mainland fruit-packs (of small fruits in particular), to par with those of the United States for Prairie markets, must contain fruit picked uniformly on the green side; uniformly graded to United States standards; well filled and the minimum weight stamped on each package.

The Department of Agriculture should purchase at least six 30 x 40 tents for Provincial demonstrations and exhibits at the larger district fairs, wherein butter-making from the Dairy Branch, fruit-handling for the Horticultural Branch, seed-selection for the field crops, etc., could be brought directly to the taxpayers, a small percentage of whom know little of the actual work of the Department.

All of which is respectfully submitted.

K. W. Munson,
District Field Inspector.

REPORT OF PRAIRIE MARKETS COMMISSIONER.

J. A. Grant.

W. T. McDonald, Esq.,
Acting Deputy Minister, Department of Agriculture, Victoria, B.C.

Sir,—I have the honour to submit herewith my annual report as Prairie Markets Commissioner for the year 1918.

The work of the year 1918 commenced with the fixing of the price for small fruits required for jam-making by the factories. The Island associations closed for strawberries at 9 cents; Mainland associations got as high as 10 cents. These prices advanced to 12 cents when first contracts were filled. Demand was many times greater than the supply, and already at Christmas-time, 1918, contracts are made for 1919 crop at 16 cents per pound, which beats all records in price by a considerable margin.

Berry-growers throughout the Province met together and agreed on this price. Formerly they acted individually or by associations. Your Markets Commissioner has advised them as to the prices obtained as soon as contracts are signed, and this get-together co-ordination will become an annual event. The demand for small fruits for jam, etc., by factories, especially strawberries, raspberries, blackberries, and loganberries, is worth at least passing reference. It is not confined to British Columbia factories, but Eastern Canadian as well, as the Eastern stuff is frozen and shipped when ready in this state. Some of the Eastern houses find that manufacturing in British Columbia for their Western trade would be advantageous, and at least two large concerns will move part of their plant West when a supply of fruit can be assured.

Already Vancouver Island strawberries and Lower Mainland raspberries and blackberries are famous throughout Canada, and many other districts are suited to their growth, some of which, like Salmon Arm and Creston, are already large shippers. Here is one line that can be greatly developed before the demand is supplied.

Visit to United States Competitive Points.

Two visits were made to United States points; one in January, in connection with prices obtained for jam-berries and prices of crates, and investigating methods of regulating growers' supplies in relation to proposition of jam and market supply. The other visit was made to investigate crop conditions and market prospects generally. Every point in marketing was discussed freely with our Southern neighbours and very cordial relations established. The need for a mutual understanding was generally recognized, as our interests in fostering production is common.

MARKET ORGANIZATION.

Early in February the work of organizing the export shipping districts was undertaken. The main effort was made in the Okanagan Valley. While there in connection with organization-work estimates were made of the quantity of onions in storage in British Columbia, and also a report made in the matter of marketing butter by the Armstrong and Kamloops creameries. Kootenay District was also visited and also points on the main line of the Canadian Pacific Railway. Much interest was manifest at the meetings addressed and large audiences attended. The result of this direct personal contact was reflected in the co-operation shown during the season, especially in getting together in quotations from different points for the same produce at an even date.

This work continues to grow, and when better developed the real work of dealing with administrative bodies with a view to tackling the problem of better distribution to Prairie points will be in order. Reference will be made under "Distribution" heading to the possibilities for economy when this question can be adjusted.

STUDY OF TRANSPORTATION PROBLEMS.

After reopening the Calgary office and the introduction of a stenographer there, your Markets Commissioner was able to devote much time to correcting transportation conditions. During the entire shipping season close watch was kept on arriving trains, and through the co-operation of officials of the Dominion Express Company much waste caused by rough handling was averted.

LESS THAN CAR-LOAD LOTS SHIPMENTS.

Shipments by L.C.L. increased greatly last year, owing chiefly to the fact that shippers will not risk shipping in the present type of refrigerator-cars as used by the Dominion Express Company. This has resulted in considerable loss in transit through rough handling at Calgary and other junctional points where diversion takes place. The Dominion Express Company officials worked incessantly to prevent this, but at rush times it got out of control. The chief factors causing this loss were green men, scarcity of labour, and not sufficient attention given by messengers in providing ventilation, as well as unnecessary unloading and reloading. The main difficulty, however, lay in trying to do a superhuman task in the allotted time. A great improvement was noticed as the season advanced, however.

Arrangements are contemplated to test out several cars now in use, giving particular attention to ventilation in each case. This will be under the supervision of officials of the Express and Railway Company, the Dominion Fruit Commissioner, and your Markets Commissioner. The cars to be tested will be the present line car, which carries all fruit from Calgary East L.C.L.; the cowl car that carries berries, etc., from British Columbia points to Calgary; and the Niagara Peninsula fruit-car. The latter gives splendid satisfaction in the East and looks very promising for our needs. One feature of air-circulation *versus* refrigeration in raspberry-carrying was that berries arrived in better condition by the former method, which shows that the refrigerator-car now in use is more a danger than a help for this purpose.

REFRIGERATOR-CARS.

During the entire fruit-shipping season your Markets Commissioner made a careful study of the condition of arrival of British Columbia fruits and vegetables in refrigerator-cars, both in the iced-bunker car and the brine-tank car. The condition of fruit and vegetables arriving from south of the line was also noted. The condition of arrivals in brine-tank cars was usually unsatisfactory: First, because of their being overloaded; and, second, because air-circulation is not provided for.

The iced-bunker cars were satisfactory in carrying strawberries, and ventilation en route was attended to. One brine-tank was experimented with strawberries and it was a failure. The United States refrigerator-cars, being specially built fruit-cars and ventilated, arrived in a uniform satisfactory condition. These consisted of precooled berries from Puyallup and berries from Olalla which were not precooled, as far as we know.

An experiment was made in a mixed shipment, mostly peaches from Washington to Winnipeg, in brine-tank car not precooled. This proved unsatisfactory. There is little or no fruit moved from United States points in brine-tank cars because they have been found unsatisfactory there. The Canadian Pacific Railway has nearly 2,000 brine-tank cars and about 800 iced-bunker cars, none of which are fitted for fruit-carrying.

Two cars of raspberries were loaded in perfect condition at Hatzic, the first of an order for ten cars to Winnipeg. These were shipped in iced-bunker cars and both arrived in a wasting condition, caused by blue mould. The balance of the cars on order were immediately cancelled.

It is vitally important to the upbuilding of the small-fruit industry in British Columbia that satisfactory refrigerator-cars be provided. Its survival depends on this point, as we have already gone beyond our L.C.L. limit. About forty cars of raspberries were shipped to Winnipeg from Puyallup, and arrived in good order, over a greater rail distance than the Hatzic cars. These berries replaced the British Columbia berries on the Prairie market, and unless immediate steps are taken to furnish suitable fruit refrigerator-cars the small-fruit trade will be lost to British Columbia east of Regina. We are pleased to say that the matter is well advanced, and the Canadian Pacific Railway officials, with whom the matter has been discussed at Calgary, Winnipeg, and Montreal, are giving the question serious consideration.

Early Visit to Prairies.

A committee of three, one representing berry-growers, another the brokers, and your Markets Commissioner, was asked to investigate alleged overcharging for strawberries at Prairie points in 1917. Every point was visited and a close scrutiny of sales made, but in no case was any undue profit traced. This visit also served the purpose of apprising jobbers of the prospective crop in British Columbia and the prices likely to rule, and generally putting us in touch with the trade changes since closing the Calgary office in December, 1917, until the reopening in May, 1918.

Calgary Office.

The office in Calgary reopened in May, and during the season until December we kept in constant touch with all matters affecting British Columbia produce and marketing. On account of receiving permission to employ a stenographer at Calgary, we gave a decidedly improved service in replying to telegrams and letters, as during the absence of the Markets Commissioner the stenographer looked after many of them and was able to reach him by wire on important matters. This service was discontinued in December, when the Calgary office was closed for the season.

We would recommend that, in view of the increasing winter shipments to Prairie points, this office be kept open during the winter, with the stenographer in charge, who could at all times keep the Commissioner informed on the state of arrivals of produce and the trade prospect.

We notice every time that the office is closed the connection with the trade is broken. This takes time to catch up, and as our produce will soon be rolling to the Prairies during the entire twelve months this matter should receive favourable consideration.

Prairie Markets Bulletin.

Our first issue this year opened with a circulation of 800, which increased to 1,500 before the close of the season. Applications for the bulletin have been received from many jobbers as well as growers, and during the 1919 season it may be sent to jobbers in all parts of Canada.

The bulletin will be sent free on application to growers of fruit and produce as well as to wholesale dealers in same, and to the press of British Columbia. Members of the British Columbia Fruit-growers' Association receive the bulletin without application by arrangement with the Secretary of that institution.

Next year f.o.b. shipping-point prices will be an outstanding feature, as this year's experience shows that these are more appreciated by growers than wholesale or retail prices.

We take every care to see that our quotations are correct, and will find a market for producers at quoted prices for those who are unable to do so. Our staff correspondents are leaders in the produce business life on the Prairies, and every subject concerning marketing is discussed both from a grower's and buyer's view-point. We are convinced that it is this medium that is responsible for the get-together movement amongst growers and shippers, and its circulation should be increased until it reaches every grower's hands that makes produce-growing a business. It is compiled, printed, and posted every Saturday, and during 1918 we never missed the Saturday mail.

Rhubarb.

Want of organization was evident in handling British Columbia rhubarb. This allowed the f.o.b. buyer to knock the independent grower's house of cards down with arguments relating to offerings he had from other independent growers, and, whether real or imaginary, the result

was that the organized growers got more money for their rhubarb than the unorganized growers; besides, the one sold in car-lots and the other sold in quantities.

It was British Columbia rhubarb that was the best offered on the Prairies, but owing to manipulation on the part of some brokers it did not sell as high as Walla Walla rhubarb. We need a rhubarb-box with less timber and more air-space, as it was rightly claimed that the better-aerated rhubarb kept fresh longest, besides the trade demands to deal with a reliable organization that is large enough to ensure a regular supply.

Districts like Hatzic, which specialize in rhubarb, should grow early potatoes, beets, carrots, etc., to help make up a mixed car-lot. This admits of bringing in fresh rhubarb to small towns, as a full car-lot is more than they can absorb, and keeping of rhubarb too long causes loss in shrinkage and appearance.

HOTHOUSE TOMATOES.

Nearly every hothouse in British Columbia is now shipping tomatoes to the Prairies. The stuff is excellent, and the demand good up to the date when Missouri tomatoes come in car-lots. This industry can be extended and regulated when the greenhouse-men come together for this purpose. Under the present method of shipment there is danger of prices being cut without warrant owing to several wholesalers in one city ordering too heavily.

HOTHOUSE CUCUMBERS.

There is a rapid market for hothouse cukes at prices that should encourage the industry, which is another reason for hothouse-men getting together.

STRAWBERRIES.

Shipments on consignment to the retail trade were not done to any extent this year by white growers. Japanese from the Fraser Valley shipped as usual to any one that would handle their berries. Their pack in the early part of the season was slack and very poor fruit, but improved greatly as the season advanced. The trade complained against Marshall strawberries being shipped to arrive on Saturday. They had to sacrifice them that day, as before Monday they would be almost black in colour. This greatly unbalanced the market. We know a buyer that paid $3 f.o.b. shipping-point for Marshalls, which arrived in Calgary on Saturday and were jobbed at $1 per crate. The season was a great improvement over 1917, both in pack and marketing methods. Lack of organization in some places was the only disturbing factor. The crop was short and demand exceeded the supply. Car-lot shipments in iced-bunker refrigerator-cars arrived in splendid condition, the only exception being the brine-tank refrigerator-car, which was tried out as an experiment. This car arrived showing considerable wastage.

RASPBERRIES.

Car-lot shipments from British Columbia were in demand in Winnipeg, ten cars being on order at a good price. The first two iced-bunker refrigerator-cars shipped out arrived in a wasting condition, due to blue mould, and the balance were immediately cancelled. Raspberries shipped from Puyallup, Washington, which arrived in good condition, took their place, and many more cars were added to the order. This left the shippers the only alternative of using ventilated and line cars, and the whole of their crop was moved out in L.C.L. shipments. If matters are not improved the raspberry-supply of Eastern Saskatchewan and Manitoba will be lost to British Columbia.

BLACKBERRIES, LOGANBERRIES, CURRANTS, AND GOOSEBERRIES.

The above fruits were in increased demand and prices received were satisfactory. The best package for gooseberries is the Ontario 6-quart crate-basket. These baskets prevent the berries from falling out, as is often noticeable in the crate, if the lids are properly fastened on.

Growers should not increase their acreage for black currants or gooseberries, as the demand is limited and present shipment seems ample to supply present demands.

CHERRIES.

Cherries were a bumper crop. Early Richmonds and Governor Woods come in competition with Washington Bings and Lamberts. The contrast was reflected in the prices obtained. The supply exceeded the demand at one time, due to the jobbers misjudging the size of the British Columbia crop and importing too heavily from Washington. When the error was corrected

British Columbia Bings and Lamberts were in demand, and sold for a good price when the quality was good. The loss on Lamberts and Bings, that fell so heavily on some shippers, was due to splitting, mould, and rot, which causes them to leak badly, smearing the crates, thereby giving them an unattractive appearance. Steps should be taken to get close estimates of the crop in advance of its ripening season.

Apricots and Peaches.

Early estimates of the crop of these fruits in British Columbia were low, and before the real situation was made known jobbers on the Prairies had protected their trade by buying heavily in Washington. Our apricots and peaches were of good size and quality and the prices secured were good. Considerable loss was taken by overloading in transit and by careless mixing in cars containing vegetables, and in some cases due to holding too long at shipping-point. The pack was good.

Prunes and Plums.

The opening of the season for prunes and plums boded well for British Columbia supplies. The American embargo on prunes looked like a monopoly of this market for British Columbia. Sugar restrictions on both sides of the line seriously interfered with their going into consumption. For this reason Washington prices enticed jobbers here to bring many car-lots in at a shade under our prices, and, coupled with our bumper crop and bare sugar-supply, shot this market to bits. Splitting and plum-rot caused by the heavy rains in British Columbia brought them on this market in similar condition as explained in the cherries. The appearance of the crates smeared with juice looked worse than the actual state of the fruit.

Pears.

The market for pears was unusually good and prices were high for good stock. There is a growing market for our pears, and if the varieties are grown that the market demands pear-growing should be profitable. Beurre d'Anjou is the variety mostly favoured and it commands the top price. The favourite fall pear from California is the Marceau. It holds up well, and if it can be successfully grown in British Columbia it should be tried out. Its season is after the Anjou, to December and January. Bartletts and Flemish Beautys that came on the market earlier sold well. The demand for pears of good quality exceeded the supply.

Apples.

This king of our export fruit has been before the public a long time, and many improvements have been made in grade and pack. The trade has little now to suggest in improving the package, as the box now standardized gives satisfaction.

Several popular fall and winter varieties have advanced in price when offered with less popular varieties. The No. 1A so-called class commands from 50 cents to $1 per case more than No. 1B class. No. 1A Spys, Newtowns, Spitz, Winesaps, Kings, Baldwins, and Jonathans lead this class, and if scarce may find themselves ranged in No. 1A.

Prairie and Eastern dealers find that British Columbia shippers scarcely measure up to the American pack and colour. In order to base prices on a level with United States competition we must equal their average pack. It is essential that our No. 1 export stuff should be raised and at least 40 per cent. not included placed in No. 2 and No. 3 grades. No. 2 should then be better and the No. 3 also raised so that it will class with American C grade. Crated stock can take care of the doubtful balance.

There is a small first-class trade on the Prairies which demands the best we have. There is an immense trade there for a semi-perfect apple, such as the No. 2 would then be, and outlet for all our No. 3 and crated stuff for some time to come. Prices between No. 1 fancy and No. 2 are now far too close, and No. 3 is too close to No. 2. This year the Eastern trade absorbed a lot of our No. 1 fancy, and this allows the fancy trade to have the choice apples at a choice price. This fancy stuff should furnish the main profit of the apple-crop and allow the balance of the crop to be sold more reasonably.

The limit of price for Prairie general trade has been passed, and in order to encourage greater consumption prices for domestic stuff must be placed within the reach of the masses of the people.

The marketing methods in British Columbia improved greatly in 1918. Many objectional features of selling were overcome, or at least greatly reduced.

POTATOES.

British Columbia shipments were heavier than usual this year. The quality and grade was unsatisfactory, showing carelessness at shipping-point. Prices were good. Immature potatoes were too much in evidence, some showing from 20 to 40 per cent. shrinkage. Forcing too many in this state on the Prairie market in the season, in an effort to partake of the cream of prices, was practised long after your Markets Commissioner called attention to the danger. This resulted in breaking the price, and it is known that the lowest price for potatoes this year was at the time when new potatoes were little over half-grown. Potatoes from British Columbia are unexcelled in quality and the price obtained is from $5 to $20 a ton more than Alberta-grown potatoes. For this reason greater care in sorting interprovincial shipments should be compulsory. Potatoes from marble size to turnip size in the same sack and too small and too large potatoes all classed No. 1 will not tend to place our potatoes in a favourable light for Prairie buyers.

Many refusals of shipments for this reason were recorded, and your Markets Commissioner was constantly being called in to examine and adjust such shipment.

SWEET POTATOES.

So far we have not seen any British Columbia sweet potatoes on the Prairie markets. The Prairies use many car-loads of sweet potatoes annually, and many of the Prairie jobbers are of the opinion that certain localities in British Columbia are suited to growing them, especially that district from Penticton to Keremeos. I am also informed that experiments have been made at Summerland with some success, but the soil there was a little too stiff. This is a promising enterprise, and an assured market awaits successful growers.

FIELD TOMATOES.

British Columbia field-grown tomatoes were shipped in greatly increased lots, both green and ripe. They gave general satisfaction in quality and weight and good prices were obtained. More care is needed in grading, also in placing ripe, semi-ripe, and green in different packages.

Walhachin and Keremeos had a shade over other districts in the quality and pack. Bright lithographs should be used on the tomato-crates and wrapping should be dispensed with.

CELERY.

Armstrong celery was much in evidence on all Prairie markets. The early celery was the cause of grief, because it was shipped immature and in mixed cars, both potatoes and celery arrived showing great wastage. The later celery came on the market in prime condition and was in great demand.

With care in preparing and shipping, there is no reason why Canada, from east to west, should not buy Armstrong celery, as it is freely admitted to be the best on the market.

CITRON, SQUASH, AND PUMPKIN.

The amount of citron grown in British Columbia is increasing, and if much greater increase takes place it is the intention of the Markets Commissioner to take up the matter of using the citron for candied purposes with British Columbia and Eastern preserving-factories. British Columbia is well adapted to citron-growing, and in order to extend this enterprise a factory outlet is needed, as the citron is capable of producing a great tonnage per acre.

Pumpkin-growers should grow sugar-pumpkin for culinary use. It is uniform, small, good colour, and an excellent shipper, and in crates they are very popular. The "Connecticut field" now principally grown is too large and irregular in size, and dealers prefer the smaller and superior-flavoured pumpkin.

Hubbard squash is in good demand on the Prairie market, but too many unripe specimens were shipped last season. If grading and ripening were properly done, the trade would venture on car-lots of these commodities instead of the L.C.L. lots not purchased.

CANTALOUPES.

The growing of cantaloupes in Okanagan Valley for Prairie shipment can be greatly increased. The last year's shipments were generally kept too long before being shipped, arriving overripe and mouldy. Prices for hard, ripe cantaloupes ruled high and graded stock was favoured.

Cucumbers, Field and Picklers.

Field-grown cucumbers arrived in great volume, but as a rule of poor variety. Better grading is greatly needed and the variety of sorts is too numerous.

Grading as to size and shipping only green specimens should be the motto. Pickling and irregular stuff should be kept out and overripes should never be shipped. There is need for the selection of a special shipping variety. Some growers have them and ship just at the right time, but the bulk of the 1918 shipments seemed to include everything on the vine.

Cukes do not tavel well in iced cars, and they should be shipped by L.C.L. express when intended for table use. During the peak of the season it will not pay to ship everything that grows on the vine. Green, well-grown specimens of uniform size only should be shipped. There is a great demand for picklers at British Columbia preserving-factories at fair prices.

Notes and Impressions.

Shipment on consignment to retail trade was greatly demanded. The demand for strawberries and raspberries greatly exceeded the supply.

The British Columbia pack of small fruits, with few exceptions, was a great improvement over the previous year. Most of the losses suffered were apparently in transit, as few indications of carelessness on shippers' part was noticed. The exception to this was shipments made after rains.

The Magoon strawberry is the best shipper next to the Clark's Seedling, and that the Cuthbert raspberry is easily the best all-round berry.

That the British Columbia rhubarb-box is too closely built, too heavy, and needs more air-space. That British Columbia rhubarb is better in colour, crisper, and of better flavour than any other on the Prairie market.

That Walla Walla rhubarb holds up better owing to the greater chance for air-circulation in the box in which it is packed.

That early potatoes and vegetables should be grown to mix in the car-load of rhubarb.

Wynndel strawberry-crates with attractive lithographed ends are more attractive than the printed ends.

Crop Estimates.

Early estimates of the British Columbia fruit-crop, especially those made of the Okanagan crop after a severe frost last season, were entirely at sea. Especially was this noted in cherries and apricots, but plums, prunes, and peaches were greatly underestimated. British Columbia shippers know that Prairie jobbers and brokers seek to ensure a supply for their needs in various lines in advance of ripening season. If British Columbia fruitmen cannot furnish enough, the balance is secured in the United States, even at an advance over our quotations. As produce from the South arrives on the market ahead of ours, the mischief in underestimation of our crop is done before the British Columbia crop commences to roll, and even when it is rolling. This resulted in bringing to the Prairie market much fruit that overlapped ours and thereby unbalanced the market. The difference between early estimates and the actual crop should be checked up several times and corrected, so that the discrepancy will be slight.

Bearish Outlook.

The shippers and jobbers of British Columbia and Prairies have taken considerable loss in last year's business. They were compelled to buy on a high market, and owing to the crop-failure in Alberta under sugar-supply and food-control the market remained dull and lifeless, and a tendency was ever present for prices to fall instead of to rise. This, with loss in transit, shipping immature stuff, and heating due to overloading, made the way of the wholesaler hard. Untimely and misunderstood sugar restriction and poor distribution threatened the loss of hundreds of cars of fruit.

Your Markets Commissioner took up this matter in an urgent manner, both with Ottawa and Vancouver, and succeeded, with their help, in relieving the situation.

The general loss sustained throughout the 1918 season will ultimately reflect on the British Columbia growers of produce. There will be more buying from hand to mouth and less storage on the Prairies than formerly. This condition is not what growers want, but storage facilities

at shipping-point are imperative if prices are to be maintained and regulated by the producers on the basis of supply and demand. The wholesalers have taken losses in storage for some years. Much of their shrinkage has been due to Jonathan scald and bitter-pit developing in storage, and in all fairness this should be partially borne by the growers. It is not a hopeful outlook when dealers are losing money, and while in the past the growers have suffered unfairly, still we must place our wares in the hands of the wholesalers in such condition as will enable them to handle profitably. In other words, we must stand behind honest dealers.

Growers of fruit and produce must be on their guard against the bearish tendency, as it will surely be carried too far if some effort is not made to counteract it.

The strongest market will be found where growers are in control of their brokers and have their own selling agencies. This point cannot be too much emphasized, as the experience of the past, wherein the price of production was not obtained by growers, was largely the result of jobbers and brokers being in control of the market.

DISTRIBUTION.

On a widely separated market, such as obtains on the Prairies, distribution becomes one of our greatest problems. Our present method is a marked improvement on past efforts, but much can be done to economize in freight, secure adequate supply, and prevent undersupply at different points. The Okanagan United Growers and Okanagan houses supply the bulk of the produce shipped in. The unity of purpose amongst these shippers should be an instrument to greatly overcome the distributing difficulty.

If it were possible to establish a Shipping Union Distributing Depot at Calgary, many of the cars now broken up there and distributed throughout the Prairies as piecemeal could be diverted to points *en bloc*. This system is practised by the British Columbia Sugar Refinery in distributing their sugar. Perishable produce would better lend itself to this method.

When British Columbia shippers unite for this purpose the cost to the consumer can be greatly reduced, and the growing shortage of cars would be relieved. The logical distributing-point for the Prairies and Eastern Canada at the present time is Calgary.

Place of Shipment.	First Assembly Point.
Creston and Kootenay, through the Crow	Calgary.
Grand Forks, via Penticton and Sicamous	"
Lytton, Walbachin, Kamloops, and Salmon Arm, via main line	"
Arrow Lakes, via Revelstoke, main line	"
Athalmer, Windermere, via Golden, main line	"
Island and Lower Mainland, via main line	"
Okanagan, Keremeos, via main line	"

Calgary as a distributing-point would allow the whole Province to distribute from one depot. This can be worked out in detail as associations grow sufficiently, but the immediate effort should be directed to one central point instead of many expensive offices scattered through the small shipping centres of British Columbia.

UNITED STATES SHIPMENTS.

Considerable fruit shipments were made from British Columbia to points in the United States, chiefly to Minneapolis, St. Paul, and Duluth. An experiment with shipping prunes to St. Paul was only a partial success. This was largely due to the soft condition on arrival.

BRITISH EMBARGO.

The British embargo on apples was removed in November, just too late to be of much benefit, as at that date the shippers had placed almost all their stock.

The restrictions now imposed by the British Food Control Board favour the importation of poor-grade apples, but these restrictions are only temporary. The prohibitive freight rates from Halifax to Liverpool will also soon adjust themselves to normal conditions. Taking it into review that we were able to expand our interprovincial trade during the embargo period, its removal brightens the outlook. Prospect for the extension of our export trade is very bright, and full advantage should be taken of the time of market reorganization in Britain to get into touch with British dealers before they get satisfaction from foreign sources.

Loss caused by Unusual Conditions in 1918.

During 1918 we have had many unforeseen conditions to combat, some of the elements which threw in unusual climatic conditions, with their attending evils, bringing heavy losses in their wake. We need not enumerate them as they are unlikely to return for years, but here we will mention that the loss from wastage in cherries, plums, and prunes was due in a large measure to these causes.

Emergency Advertising.

The season of 1918 provided few emergencies where supply exceeded demand. The markets were well supplied, but seldom oversupplied. The exception to this came in cherries, plums, prunes, tomatoes, and cucumbers. Emergency advertising was resorted to, and several leading articles were written with the authority of the Markets Commissioner, calling the attention of housewives to the passing of the season. This had usually the desired result.

The other matter of urgency was the advertising of how to preserve with minimum of sugar and assuring housewives that for making crab-apple jelly abundant sugar could be purchased with the approval of the Canada Food Board.

British Columbia fruit-growers should have a reserve fund for emergency purposes, as without it many thousands of dollars may be lost. Last season the situation was bridged by the wholesale trade doing the advertising, supplemented by the British Columbia Fruit-growers' Association.

There is a great scarcity of home-preserved fruits, due to fruit and sugar shortage, which promises well for good prices during the season 1919.

Visit to Eastern Markets.

After the last issue of the Prairie Market Bulletin your Markets Commissioner visited Toronto, Ottawa, and Montreal with a view to market extension. The brokers and jobbers in these cities were called on and some of the leading retail merchants interviewed.

Our apples are in good repute and boxed apples from British Columbia are increasing in demand very fast. It is admitted there that the fruit from the Western States is the only competition we have to count upon. While our produce is popular, it is quoted as high as Washington and Montana stuff. It is claimed rightly that our grade and colour is less carefully put up, and that our boxed apples for this reason should be quoted from 10 to 25 cents a box delivered less than similar varieties from the United States. Eastern buyers would prefer an equal pack at an equal price, as colour and uniform size is more important than price.

There is a demand for our Bing and Lambert cherries in 10-lb. flat or 24 deep pint crates by the car-lot in Montreal and Ottawa, and for our Italian prunes in all three cities. These cities are the distributing-point for all Eastern Canadian points that are interested in British Columbia fruit or vegetables.

Our trade east of Winnipeg in 1918 was more than double 1917, and this market should be supplied with only choice produce, for the reason that their own produce of similar kind to what we ship in is of very good quality, and it is only the superior grades that interest them. For this reason a careful inspection should precede shipments east of Port Arthur to ensure a high quality only being shipped to Eastern points. Our aim should be to equal the produce shipped by our Southern competitors.

The Eastern Canada market for British Columbia apples, cherries, and plums has been further developed this year, and our east of Winnipeg sales this year have doubled last year's output.

Ontario and Quebec had a fair crop of clean fruit, and notwithstanding this fact the fancy trade prefers the box British Columbia fruit to the Eastern barrelled stuff. The increase of our shipments means the displacement of North-western States importations.

The uncertainty of fruit rates on British Columbia apples to Montreal was the means of a loss of many cars of fruit this year. This matter should be settled beyond doubt this year long before the apples are ready to ship.

The Eastern trade can be doubled several times if the British Columbia shippers would enforce a discipline amongst their growers of a rigid kind. It should be borne in mind that only fancy stuff of highest grade is needed in Ontario and Quebec.

CONCLUSION.

This report would be incomplete without reference to the splendid co-operative spirit and willingness to exchange marketing information between our office and managers of competitive concerns in the North-western States. Expressions of a hope that British Columbia concerns would join with them in equalizing express freight rates and in all other things that point to their mutual interests. We tender these officials a furtherance of our sincere thanks for much valuable information supplied, and include the United States Market Bureau of Washington, D.C., and the Spokane branch of same.

We also want to commend the cordial co-operation of the Dominion Inspectors under C. W. Baxter in helping to raise the standard of our pack without undue injury to the producer who is entering the shipping business, and also appreciate the splendid offer of the Chief Dominion Fruit Commissioner to co-operate to the limit of his power with all Provincial efforts towards the betterment of marketing Canadian fruit. Also the prompt and reliable service rendered by Assistant Horticulturists and fieldmen of the British Columbia Horticultural staff, and the British Columbia Coast Markets Commissioner for assistance in organizing growers in British Columbia for Prairie trade shipment, and also for timely help in relieving the sugar shortage on Prairies and adjusting the potato glut in the early season at Calgary.

All of which is respectfully submitted.

J. A. GRANT,
Prairie Markets Commissioner.

REPORT OF COAST MARKETS COMMISSIONER AND INSPECTOR IN CHARGE OF EXPORTS.

R. C. ABBOTT.

W. T. McDonald, Esq.,
Acting Deputy Minister, Department of Agriculture, Victoria, B.C.

SIR,—I have the honour to submit herewith my fourth annual report on marketing conditions in the Coast section of the Province of British Columbia; also report on the inspection-work under my charge during the year 1918.

WEEKLY MARKET LETTERS.

As in former years, weekly market letters have been issued from this office to farmers, transportation company officials, shipping and wholesale firms; also to a large number of newspaper concerns, who desired the same for publication. These reports were mailed to any interested party upon request. At the end of the year our mailing-list contained some 1,185 names.

We have experienced a great deal of difficulty in issuing these reports this year. During the first part of the season we could not obtain the proper brand of ink, and after installing a new machine we were confronted with the fact that the entire supply of paper used in this work was exhausted and we were compelled to use a very inferior substitute. Both these factors were uncontrollable.

In these letters we confined ourselves as much as possible to market problems affecting the individual producer and Farmers' Co-operative Associations. Market questions of immediate issue were discussed in these letters, and many letters of appreciation have been received from farmers who take an interest in the marketing problems of the day.

A large number of individual inquiries from producers have been answered by letter, telephone, and telegraph.

ACTIVITIES OF THE OFFICE.

During the spring of 1918 this office gave assistance to growers of Burnaby in the line of organization. A number of meetings were held and two co-operative organizations were formed—namely, the Burnaby Lake Fruit-growers' Association and the Burnaby Producers' Co-operative Association. Owing to the geographical construction of Burnaby District it was thought best to form two organizations—one to look after the interests of the growers on the Burnaby Lake line of the British Columbia Electric Railway, and the other to operate on the Central Park line or West Burnaby.

After organization assistance was given these associations by arranging contracts for their fruits. These contracts were made with one wholesale firm at a fixed price at the farms of the growers for the entire crop of strawberries and raspberries. The contract price was $2.50 for No. 1 strawberries and $2.10 for No. 1 raspberries.

The Burnaby Lake Association handled lime and boxes, etc., for their members, and reported a very successful season.

Every encouragement was given these organizations in the use of the two-fifth shipping-crate for raspberries in preference to the two-fifth local, as used in former years. The former association used the two-fifth shipping-crate entirely, while the latter shipped in the two-fifth local crate. Hence the discouraging results obtained by the latter association.

During the berry season a number of fruit picking and packing demonstrations were held in these two districts. These were very well attended and the results obtained were good.

Assistance was also given the North Vancouver Producers' Association in the organization of their association for the handling of eggs, poultry-feed, and supplies.

Adjustment of Disputes between Consignee and Consignor.—Many shipments of fruit and farm produce are received by buyers here which do not come up to the standards or which may be spoiled in transit. In such cases, upon request of either party, this office made inspection and issued an unbiased report of the actual conditions of the shipment. In some instances, where farmers living at a distance were unable to come to the city and make their own adjustments, this office made the required adjustment. In no instance does this office accept any remittance for the producer, but always insists on cheques being made out direct to the shipper and mailed in our presence when possible.

Overcharges in Freight and Express.—We also made adjustments of overcharges in freight and express for growers who were not in a position to do so themselves.

Storage Investigations.—Investigations into the methods of storing potatoes have been carried on during the last three years, and from the information obtained much timely advice was given out this season during the storing period.

Loss in Transit from Improper Loading.—Investigations made by this office in regard to loss in transit show that a very large percentage of this loss, as well as a great deal of the disagreements and disputes between the shipper and the buyer, is caused by improper loading. Every season there are heavy losses in tomatoes, peaches, and apricots, caused from being loaded without making provision for proper circulation of air and lack of icing cars.

The losses in potatoes have been heavy. It was found, on investigation, that potatoes grown in the districts of Lillooet and Ashcroft showed the heaviest shinkage within a period of sixty days after digging. Our investigations in 1917 brought out the facts that potatoes in these districts, when dug, had a temperature of from 70 to 83° Fahr. These, when dug, sacked, and loaded tightly in cars without any ventilation, went through a severe process of sweating. The high temperature and the moisture brought out or developed *Fusarium* diseases, such as jelly end-rot and black-rot (Western field-rot). Black-heart was also developed, which is caused by poor storage such as we find in tightly closed cars.

During the fall of 1918 Mr. Gutteridge, Assistant Potato Inspector, was stationed at Lillooet and gave the growers of that district much useful information in the proper loading of cars. As to the results of his work in that district, I have only to state that all cars were checked at this end and those loaded according to instructions arrived here in the best of condition, while at least 90 per cent. of those shipped under the usual method of loading showed shrinkage.

In this connection I cite one case of where a dispute arose between the shipper and the buyer over the condition of three car-loads of potatoes. In order to test out the necessity of absolute protection for the producer and the feasibility of handling such cases, this office undertook the supervision of picking over and regrading the three cars, with the result that 14 tons 2 cwt. of potatoes were saved and sold for $27.50 per ton; whereas under ordinary methods of resorting in the wholesale houses these would have been an absolute loss and charged back to the grower. The results obtained in the above instance were so encouraging that the work was continued throughout the shipping season, and the work of resorting some forty-eight cars, over

There is much work to be carried on in this line, and it is the aim of this office to continue which disputes between grower and buyer arose, was carried on under the supervision of this office. these investigations, with the hope of educating the shippers to the great necessity of proper loading of produce to ensure safe transportation.

The heavy minimum insisted on by the railroads has, in my opinion, been more of a detriment than a benefit and has caused a wanton wastage in foodstuffs, which eventually terminated in high prices to the consumer.

Advice to Shippers.—In all cases where we find shipments arriving in poor condition we immediately write the shipper and draw his attention to the fact; also giving him advice on how to grade and pack and the best methods to use when putting his produce on the market to obtain the best results.

Fruit Inspection.—During the caterpillar epidemic in Vancouver City, South Vancouver, and Point Grey the inspection-work was carried on by this office; 3,110 inspections were made and forty-one quarantine notices issued.

This inspection is a very hard one to handle owing to the fact that there are only one or two trees in each back yard. Very few of the owners of the property have spray-pumps. We found in the majority of cases that the owners or tenants of the property were not willing to invest in spray-pumps, but were willing to pay for having their trees sprayed. The inspection took in an area running from Cedar Cove to Central Park in a line with Cedar Cottage on the east, and extended west to Arbutus Street and in southerly line to Eburne and south-east to Central Park.

There is every indication of a severe outbreak in 1919 in this same district. While experts claim that this year will see the last of the worst of this epidemic, we might say that in our work of 1918 we saw very little evidence of parasitizing.

Egg Inspection.—No Chinese eggs have been marketed here this year. Imports from Eastern Canadian points and the Prairie Provinces composed the greater part of our outside supply, a very small quantity coming in from the United States as compared with other years.

Potato Inspection.—This work not only covered all export shipments from west of Yale, but also inspection on local shipments.

General Inspection.—General inspection was given on all lines of produce, including poultry and dressed meats, shipped by producers. When these were not up to the standard, letters were written to the producers advising them of the best methods to put same up for the market.

LOCAL MARKETS.

During the whole year of 1918 our local markets were well supplied with British Columbia fruit and produce.

Strawberries.—The price of strawberries remained high throughout the season. The main supply came from Vancouver Island and Burnaby. Haney and Burnaby Districts were under contract with wholesale houses here. The quality in general was only fair as compared with other seasons.

Ever-bearing varieties were on the market almost continually up to December 1st. These berries sold wholesale at an average price of $4.50 per pint crate. The demand will take a considerable quantity of these, and it will no doubt be several years before there is any over-production of this fruit, as their carrying qualities appear to be conducive to long-distant shipping.

Even though the prices for the main crop of strawberries were out of the reach of the ordinary householder for canning purposes, the supply was below the demand.

Raspberries.—The raspberry business was pretty well in the hands of three wholesalers. The season was bad and difficulty was experienced in getting berries in shape to stand up for long shipments.

Close investigations have led us to believe that the Antwerp variety should not be grown here for shipping purposes. After a careful study we believe the time is near when Herberts and Cuthberts will demand a premium over Antwerps even on the local market. Although the production of raspberries is gradually increasing, the demand is increasing more rapidly.

Blackberries.—There were very few of these on the Coast markets this season. The demand is not great, but it is encouraging to note the increased demand from the middle Provinces for the Evergreen variety. The acreage in these is very small, and while from some quarters an increased production is encouraged, we believe this can easily be overcome unless some assurance of the demand comes from the cannerymen.

NOTE.—Several car-loads of strawberries, raspberries, and blackberries were frozen and shipped to Ontario for canning purposes.

Loganberries.—The supply was far short of the demand. Prices were good. In our opinion the demand for these berries will increase each year and increased production can safely be encouraged. This berry is fast becoming a favourite on all markets and is a profitable one from both the producer's and the consumer's standpoint.

Gooseberries.—The greater portion of the gooseberries shipped here during 1918 were shipped in bulk and sold by the pound. The demand was not strong owing to the sugar situation.

Currants.—The demand for reds was good and is gradually increasing. Blacks were short on supply.

Cherries.—Sour cherries were a drug on the market. Sweets of the Bing and Lambert varieties were in good demand. British Columbia supplied the bulk of the supply this season.

Plums and Prunes.—In previous years the Lower Mainland shipped these in in quantities far in excess of the demand, but owing to the ice-storm in the early spring of 1918 many trees were broken down and thus the supply was cut down. Very little wastage was reported this season.

Apricots, Peaches, and Pears.—Very few apricots came in from British Columbia points. The supply of British Columbia peaches was much greater than in former years and found a ready market.

Pears from local points were marketed loose in orchard-boxes and a large quantity was moved. Bartletts and Clarigeaus from the Island found a ready demand. The Coast markets are always good for good pears.

Apples.—British Columbia apples are to be found in every wholesale fruit and produce house on the Coast. Foreign apples were only imported early in the spring when British Columbia apples could not be supplied. Apples of all varieties appeared to fall down quickly this season and we heard the same complaint from every quarter.

The crowding of winter varieties on fall varieties has caused considerable loss. As soon as long-keeping varieties are on the market retailers will take these every time in preference to fall varieties. This leaves the fall varieties on the wholesalers' hands and they are ultimately "slumped" or lost.

Potatoes.—During the early part of this year this office experienced much difficulty in the marketing of potatoes owing to the various conflicting reports published by members of the Canada Food Board Committee and speculators. Shipments to the Prairie Provinces commenced on January 17th and continued up to May 23rd. The total shipments in this period amounted to 245 cars of an average of 22½ tons per car. These shipments were all inspected and certificates issued.

New Potato Shipments.—New potato shipments from East Delta commenced on July 2nd and continued to August 23rd. These amounted to thirty-eight cars, thirty-five going to the Middle West and three to the United States.

Mixed Vegetables.—The quantities of parsnips, beets, and turnips shipped export far exceeded previous years. Shimpents of new cabbage during July amounted to 50 tons. These were of excellent quality and of good size. The total shipments of mixed cars of vegetables for the year from the district west of Yale amounted to twenty-two cars. This and the new potato shipments is all new business and proves beyond a doubt that these shipments can be greatly increased.

Dry Beans.—During the early part of 1918 beans went as high as 13½ cents a pound to the grower and speculators bought up the whole crop. This high price encouraged growers to grow larger quantities in the season of 1918, which is practically all in the hands of the growers at the present time. The high prices of the 1917 crop retarded consumption and many car-loads of the 1917 crop are still in the hands of the buyers. In spite of the fact that we have a large supply in British Columbia, shipments of Oriental beans continue to arrive.

It might be well to mention here that Pintos and coloured beans are gaining favour on the markets and are now commanding almost as high a price as the white Navy bean.

Onions.—The quality of British Columbia onions this season in general was good, although the size was much below what was required by the market. Heavy loading in the cars without decks was the cause of much waste.

Tomatoes.—Hothouse tomatoes were in good supply and the prices held high throughout the season. A very large increase in the Eastern shipments was recorded. Field tomatoes came in early from Departure Bay. These were of good quality and exceptionally well graded and packed. Car-load lots from the Interior of British Columbia came in in lug-boxes, crates, and tomato-boxes. The lug-boxes met to some extent the cheaper demand for home canning.

Miscellaneous Fruits and Vegetables.—British Columbia sweet chestnuts, walnuts, and filberts were on the market in small quantities. The chestnuts and walnuts were of excellent quality. The filberts were picked too green and in our opinion placed on the market at least one month too soon.

Vancouver City takes approximately 50,000 lb. of sweet chestnuts, besides several cars of walnuts and filberts. All three of these grow and bear well in the Lower Fraser Valley and we believe the planting of these nuts should be encouraged.

Considerable quantities of home-grown Jerusalem artichokes were marketed during the fall. In one enterprising garden at Kerrisdale, Globe artichokes were grown very successfully, and it would appear from this year's success that it will be quite possible to grow these on a commercial scale.

Head-lettuce is always in great demand in the Coast cities and 1918 was really the first year any great quantities were grown in British Columbia. The Chinese gardeners were able to grow this very successfully and several acres were marketed in the City of Vancouver.

Cucumbers, for both pickling and market sale, were grown very extensively and successfully on the Lower Mainland.

Eggs and Poultry.—Eggs reached the highest price in November, 1918, that has been recorded in British Columbia for over thirty years; eggs reached retail at as high as $1.20 a dozen; while poultry, milk-fed, retailed at 70 cents and turkeys at 75 cents a pound.

Large quantities of turkeys reached this market from Alberta during the month of December. These were laid down in Vancouver at 42 cents per pound and retailed at 55 and 60 cents per pound. There was a very large increase in local turkeys this year. This was fine stock and in some instances the farmers were paid 62 cents per pound dressed.

Hay and Grain.—Hay prices have held high, with the exception of alfalfa. This dropped early in December owing to the heavy importations from the State of Washington. Local oats cleaned up early.

Hogs and Dressed Pork.—Live hogs held up well until December, when there was a sudden drop in prices of 4 cents a pound to the farmer. Retail prices held even. Young pigs, although scarce in the spring and prices became exorbitant, met with a severe "slump" early in the fall, when the market became so overcrowded with small pigs that some lots had to be returned to the shipper unsold.

SUMMARY.

In looking back over the year we find little complaint can be made from the producer's standpoint. It might be stated here that our investigations disclosed the fact that, due to the high prices, many farmers and shippers took a chance on the markets with inferior stuff and eventually lost out, as the markets will only stand a limited quantity and dealers will only tolerate this kind of business to a very small degree.

Respectfully submitted.

R. C. ABBOTT,
Coast Markets Commissioner and Inspector in Charge of Exports.

REPORT OF PROVINCIAL PLANT PATHOLOGIST.

J. W. EASTHAM, B.Sc.

W. T. McDonald, Esq.,
Acting Deputy Minister, Department of Agriculture, Victoria, B.C.

SIR,—I have the honour to submit herewith my annual report for the year 1918.

NEW DISEASES.

Leaf-roll of Potatoes.—This disease has for some time been receiving serious consideration in the East, being regarded as one of the chief causes of poor yields. It is not, so far as can be discovered, due to any parasite, but to some degenerative change in the constitution of the plant. It is transmitted by the use of tubers from diseased plants for seed, plants from such seed usually showing the disease in an increased degree. Badly affected plants are readily recognized by the rolling-up of the leaves from the margin and by the often numerous small tubers set close to the base of the stem. The disease has not been noticed in British Columbia previous to this

year, when a very well-marked case was found in the vicinity of Vancouver, a large proportion of the plants of several varieties being so badly affected as to be worthless. Since the disease is not of parasitic origin, special measures such as spraying are of no value, the only means of preventing its increase being to select for seed only tubers from healthy plants. This means the use of a seed-plot with careful "roguing-out" of diseased plants or selection of seed from sound and prolific plants only from the general crop.

White-pine Blister-rust.—This disease appears to have its origin in Russia and Siberia and was probably introduced into the Eastern part of this continent about ten years ago in importations of white-pine seedlings from Europe. About three years ago it was found to be established in a number of the States and Provinces beyond hope of eradication. Like many other rust fungi, the parasite has two alternate host-plants; in this case five-leaved pines being one host and species of *Ribes* (gooseberries and currants, including wild forms) the other. The disease may be carried on either of these types of plant, although it is destructive chiefly to pines. There is some reason to believe that the western white pine (*Pinus monticola*) is more susceptible than the eastern species (*Pinus strobus*), and therefore that the disease would be more severe in the West than in the East should it become established.

During the past season I have made numerous examinations of currants and gooseberries for the stage of the rust occurring on them, with negative results. The stands of white pine, however, are somewhat remote from the centres of cultivation and no attempt has been made to make an adequate inspection of the pine districts. In the Kootenays, and particularly in the vicinity of Kaslo, however, a large number of pines were examined and no rust found. Importation of five-leaved pines have been prohibited since 1917, but the files of the office of the Inspector of Imported Stock have been gone over for the preceding five years in an effort to trace shipments of these. This has not proved very satisfactory, since many such pines might be included under the invoice titles "evergreens," "ornamentals," etc., but a number of importations have been followed up and the plants inspected. In this case also no disease has been found. There is reason for hoping, therefore, that the Province is at present free from the disease and may be kept or if adequate measures are taken to exclude possible carriers of the disease.

Experimental Spraying.

Apple Anthracnose.—This work was continued at Keating, V.I., in co-operation with E. W. White, the same plots being used. The early spray, with 3-4-40 Bordeaux mixture, was given on September 1st, 1917, and the late one, with 6-6-40 strength, on October 30th. The cankers were counted on May 14th, 1918. The difference in the appearance of the trees as compared with their condition two years ago when first sprayed was very marked. The new growth having been preserved for two years, it was not possible to count all the twigs and the cankers on each as was previously done. Alternate trees in each row were closely examined for new cankers. Six trees, sprayed with the early spray only, showed thirteen new cankers, an average of a little over two per tree. On five trees which received both sprayings seven new cankers could be found. Five trees, which received the late spraying only, had an aggregate of fifty-two new cankers, or an average of 10.4 per tree. The evidence in favour of early spraying, even with Bordeaux mixture of half the strength used later, was again convincing. An unsprayed tree similar in every respect to those in the sprayed plot and adjoining them showed fifty-three new cankers, only a portion of the tree being examined. As in the previous year, the apples, when packed early in January, required no special treatment, and therefore no cost was incurred over and above that of the actual spraying, which amounted to about 15½ cents per tree for the first application and 24 cents for the second. Since the first spraying was almost as effective as both combined, the cost of protection is comparatively slight. The effects of the previous year's spraying were already of practical value, the grower stating his 1917 harvest to be the best he had had for many years from these trees.

Apple-scab.

The work on apple-scab control was again carried out in co-operation with the staff of the Horticultural Branch on the same plots at Salmon Arm, Vernon, Forslunds (on the Arrow Lakes), Nelson, and Creston. This is the third year that this work has been carried on. Certain problems remain for further investigation, but the three-year tests have given us the necessary data for recommendations for scab-control, in an ordinary year, in any of the above localities.

The rains in mid-August introduced a new factor this year and the late spray which in previous years had appeared to be money thrown away proved valuable. A detailed analysis of results is not given here, as it is proposed to publish them in bulletin form.

POTATO-DISEASES.

Early in the year, at a conference between the Plant Pathologist and the staff of the Soil and Crop Division, it was decided to inaugurate some work, partly experimental, partly demonstrative, to improve the yield of potatoes in the Lower Fraser Valley. This work was to include the selection of seed from the owner's stock when this was reasonably satisfactory in quality, disinfection of the same with formaldehyde, and the spraying of the growing plants as a protection against late blight. The work was carried out by E. Hogan, A. P. W. Anketell-Jones, and myself, the last-named being responsible for the direction and checking-up of the disease-control work, with which aspect alone this report deals.

In order to arouse interest in the work and to secure suitable plots for it, a series of meetings were held and addresses given by the three representatives of the Department above-mentioned, in which the aims of the work were stated, the improvement of the crop by selection and methods of cultivation discussed, and the chief potato-diseases illustrated by specimens and the measures for their control outlined. These meetings were held at Chilliwack, East Chilliwack, Atchelitz, Rosedale, Cloverdale, and Ladner. Offers of the required plots for carrying on the work were made and accepted at Chilliwack, Sardis, South Sumas, Surrey Centre, Kensington Prairie, and Sullivan. Later it was found necessary to discard the plots at Sullivan for spraying-work. The chief object from the standpoint of disease-control was to determine the best methods of preventing late blight. This disease almost every year causes great loss in the moist climate of the Lower Mainland, whilst spraying for its control has never been done. Under Eastern conditions, when the potato-bug, or Colorado beetle, begins to strip the plants when a few inches high, spraying has to be done early in the season for this pest, and the Bordeaux mixture to control blight can be combined with it at little extra cost. Under our conditions it was thought likely that spraying could be postponed satisfactorily until early in August. All the plots were carefully examined on July 16th and 17th and no trace of late blight was discovered. A little was found on July 29th at Chilliwack, and following the cold wet weather of August 14th, 15th, and 16th late blight developed rapidly. The following are the records for the individual plots. Figures as to comparative yields and keeping qualities of the sprayed and unsprayed plots are not yet available.

Surrey Centre.—The soil here was very light and peaty. The plants suffered a good deal from sun-scorch, and by August 7th, when the first spraying was made, early blight had proved unexpectedly severe. No late blight developed. Spraying had some effect in keeping the foliage green, but when the plot was last visited on September 27th practically everything was dead and the yield very light.

Kensington Prairie.—Early blight did not do anything like so much damage in this case as in the last owing to difference of location and better soil conditions. The crop was vigorous, there being a marked difference between the plots from selected and treated seed and adjoining plots which received no special care in this respect. Very little late blight developed, however, so that when last examined on September 27th there was little difference noticeable between the plot sprayed once and that sprayed twice. All sprayed plots contained fewer dead plants on this date than the unsprayed.

South Sumas.—A little late blight showed in a low spot in the field on July 29th. Plots were sprayed on August 2nd; examination on August 13th showed no spread on the sprayed plots, but a little on the unsprayed. On August 17th two of the three plots were sprayed again. On August 28th the sprayed plots were still in good condition, little difference being observed between that sprayed once and those sprayed twice; but there was a marked increase of late blight on the unsprayed portion, two spots being killed out. (*See* photograph.)

Sardis.—The ground here appeared to be in good condition and well drained, but was very much infested with horsetail, indicating the presence of a wet substratum. This horsetail helped to hold moisture that assisted the spread of blight, which was much more marked on these plots than on any other of the experimental ones. There were plenty of fields in the Chilliwack Valley, however, quite as bad as the unsprayed plot here. On July 29th there was little early blight or tip-burn and no late blight visible. On July 30th three plots were sprayed with 4-4-40

Showing the spot where blight started in the unsprayed plot at South Sumas. Note the dead stalks of the blighted plants.

View of the unsprayed plot at Sardis. All the plants are dead. The plots on each side of it received one spraying.

Bordeaux mixture. On August 13th the sprayed plots appeared in good condition, only a little late blight being found on close examination. On the unsprayed plot late blight was quite noticeable. On August 19th two plots were sprayed as before. On August 28th the plants on the unsprayed plot had turned completely black and many of the tubers were diseased. On one plant examined eight out of thirteen tubers were diseased. Tubers on all plants examined on sprayed plots were sound. One plot was sprayed again on this date. A final examination was made on September 6th. It was possible at this date to pick out clearly with the eye the line of demarcation between the four plots sprayed respectively three times, twice, once, and not at all, by the increasing amount of blight on them. The photograph shows the contrast between the plot sprayed once and that unsprayed. A measured rod on an average row of the unsprayed plot yielded 14 blighted tubers and 100 sound ones, 62 of marketable size and weighing 20 lb. A similar rod from the plot sprayed once yielded 96 tubers all sound, and the 70 marketable ones weighed 27 lb.

Chilliwack.—This plot was well in the open, not shaded by trees, and late blight only developed to a slight extent even on the unsprayed plots. In this field varietal differences were apparent, the unsprayed plot of Scottish Champion showing less blight than a plot of Dakota Red sprayed once.

While the work of the past season has been more or less of a preliminary nature, the following results have been gained:—

(1.) That late blight did not appear until August, and even one spraying gave a considerable degree of protection against it.

(2.) That dates of spraying cannot be determined with reference to late blight only, since early blight may be very destructive in seasons like the past. This could probably have been controlled in a good measure by earlier spraying.

(3.) The necessity of testing and comparing different types of sprayers, the mechanical aspect of spraying-work being the most unsatisfactory. The type of machine used, whilst fairly satisfactory for small areas, say up to 5 acres, would be too slow for a large acreage.

Weather Conditions and Disease.

In addition to the effects noted above on potato-diseases, the weather conditions during the past season were important in other directions. A good deal of this is due to the heavy rains which were pretty general over the Province about the middle of August following a hot, dry season. This resulted in a great deal of apple-scab, fruit-pit, and a very general condition of premature breaking-down of the tissue of apples. Some peculiar cases of rotting of apples in storage were called to my attention. These apples were of the variety Delicious, grown in the Vernon and Oyama Districts. Ordinarily, the climate at these points is too dry to permit of the development of apple-scab, except during the early part of the season. The moisture from the heavy August rains, however, had been able to collect and remain long enough in the stem end of the apples to bring about a general infection with scab in the cavity. The scab-spots varied from five to over twelve in each cavity and were very small and inconspicuous. Since the rest of the apple was free of scab, the fruit was very naturally packed as No. 1. Unfortunately, rot-fungi gained access through these scab-spots, with the result that a large percentage of the apples rotted in storage. Whilst the conditions which resulted thus might not occur again for some years, it emphasizes the value of spraying against scab. Technically, the case is of interest in that the rotting was not due to the usual causal fungus, but to another one which is being investigated further.

Codling-moth.

A number of supposed cases of codling-moth infestation having been reported during the last two years from New Westminster, considerable time was spent this fall in following them up. In all cases, however, the pest proved to be lesser apple-worm.

Field-work, etc.

A considerable amount of time has been spent, as usual, in the field with the different Horticulturists and Inspectors, inquiring into and advising regarding local disease problems. In addition to the routine work and correspondence of the laboratory, special attention has been given to the local movement of greater production. I gave two addresses on plant-diseases at the University in connection with the "Fight or Farm" course on garden farming, and have

paid over 200 visits in the vicinity of Vancouver, mostly in response to requests, to advise on pests and disease. Some work has also been done in getting data for the War Emergency Board of American Plant Pathologists.

EXHIBITIONS.

An exhibit of plant-diseases under the personal charge of the Plant Pathologist was shown at the Vancouver and Chilliwack Exhibitions.

CIRCULARS.

The following circulars were prepared and issued during the year: Spray Calendar for 1918; Diseases of Stone-fruits in British Columbia; Apple and Pear Scab; Potato-diseases; Apple-tree Anthracnose.

VERNON OFFICE.

During the past year R. C. Treherne, Field Officer of the Dominion Entomological Branch, has made his headquarters at the Vernon Laboratory. The services of M. H. Ruhmann, assistant to the Plant Pathologist, previously in charge of the Vernon Laboratory, have been placed, without reservation, at the disposal of Mr. Treherne for entomological work. The technical results of the work carried on will be published elsewhere, but a brief statement of the work done by Mr. Ruhmann is given herewith.

Observations were made and some experimental work done on codling-moth, onion-maggot, and climbing cutworms. Some very satisfactory results were obtained with the last-named pest. In one case 80 acres of land planted to tomatoes had suffered so badly that replanting was necessary. The area was treated with poisoned bait with such good results that upon replanting not a single plant on the whole 80 acres was lost.

Much of Mr. Ruhmann's time has been given to the work of improving the technical equipment of the laboratory. A large insectary has been erected on the Court-house grounds, the material for its construction having been furnished by the Dominion Entomological Branch. A first-class photographic enlarging-lantern has been purchased, which necessitated the rewiring of the laboratory. A large vertical camera-stand has been made. Many photographs have been taken of insect-injuries and life-histories. It is intended to use these instead of Riker mounts for exhibition purposes. The remainder of Mr. Ruhmann's time was given to supervising the breeding-cages in the insectary, collecting and caring for material.

In addition, exhibits were prepared and shown at the fall fairs at Kelowna, Armstrong, and Summerland, Mr. Ruhmann being in attendance to answer inquiries.

Respectfully submitted.

J. W. EASTHAM,
Provincial Plant Pathologist.

REPORT OF INSPECTOR OF IMPORTED FRUIT AND NURSERY STOCK.

W. H. LYNE.

W. T. McDonald, Esq.,
Acting Deputy Minister, Department of Agriculture, Victoria, B.C.

SIR,—I have the honour to submit herewith my report of the work carried out by the Inspector of Imported Fruit and Nursery Stock, etc., and his staff of assistants during the year 1918.

STAFF.

The personnel of this Branch of the Department of Agriculture consists of your Inspector, three Assistant Inspectors, and clerk-stenographer stationed at Vancouver; also a Quarantine Officer at each of the following points of entry into the Province: Victoria, Nanaimo, Prince Rupert, Abbotsford, Huntingdon, Similkameen, Osoyoos, Bridesville, Midway, Grand Forks, Rossland, Waneta, Cascade, Kingsgate, Newgate, Cranbrook, Fernie, and Revelstoke. At Victoria the Quarantine Officer occasionally employs an assistant.

Customs Officers at Penticton, Osoyoos, Rykert, and Pacific Highway look out for any infested fruit or vegetables that may be brought across the boundary by way of wagon-road, only small quantities sufficient to accommodate the travellers on their journey being allowed. Larger quantities and consignments are admitted only at points of entry where regular Quarantine Officers are stationed.

It is the duty of the Quarantine Officer to inspect fruit, vegetables, rice, corn, peas, and beans coming into the Province, issue certificates, and collect inspection fees, which are paid into the general revenue fund of the Province.

Condemnation of Fruit, etc.

Imported fruit, vegetables, etc., found to be infested with any insect pest, or infested with any disease of sufficient importance to bar their entry into the Province, are shipped out by the most direct route or destroyed. The most important insect pests and diseases to which such radical treatment applies are: Codling-moth, San Jose scale, Mediterranean fruit-fly, potato-tuber moth, peach-worm, potato-canker or wart-disease, powdery scab, pea and bean weevil, and citrus brown-rot.

Cereal and Stored Products.

Imported rice, corn, peas, beans, etc., when infested with moth beetles or weevil, are either rejected, fumigated, or isolated, according to the extent or nature of the infestation. Special accommodation for fumigating such products is provided at Vancouver and Victoria.

New Quarantine Officer appointed.

In order to accommodate fruit entering the Province in commercial quantity by way of Osoyoos, Dr. G. S. Jermyn, Customs Officer, who had previously acted as temporary Quarantine Officer, was regularly appointed by your Inspector in November.

Work at Vancouver.

All nursery stock, trees, and shrubs coming into British Columbia, or entering Canada by way of British Columbia, have to come to Vancouver for inspection and fumigation. This work is carried out by the officers stationed at Vancouver, who are also responsible for the inspection of all other importations of horticultural or field products already referred to.

Vancouver Fumigating Station.

The building provided for the fumigation and inspection of imported nursery stock, trees, shrubs, and plants is also used to fumigate imported rice, corn, beans, peas, and many other consignments that are infested with objectionable insect pests from abroad. In addition to the regular officers stationed at Vancouver, a foreman and two or three men are employed at the fumigating station by the day whenever there is sufficient work to warrant extra help. These men are expert packers of nursery stock as the result of their having been engaged at that particular work when required during the last several years, and it is very fortunate for the Department that their other occupations permit them to come at short notice. Mr. Lane, the foreman, is almost regularly employed owing to the steady use of the buildings for fumigating imported cereals when the nursery stock season is closed, which is from May 1st to October 1st. The only repairs during the year were renewing the wagon-road and repairing roof of lean-to.

Victoria Fumigating Station.

As all the fumigation of imported nursery stock takes place at Vancouver, the accommodation at Victoria is only for the fumigation of imported cereals or stored products that may require such treatment at that port. On several occasions during recent years the one small building of 16 by 20 feet was not large enough to accommodate the demand, in spite of the fact that the Mount Royal Milling Company have a chamber on their own premises for fumigating the rice they import. There was considerable complaint from some of the importers last summer owing to this lack of accommodation, and your inspector was requested by the Hon. the Minister of Agriculture to make what arrangements might be necessary under the circumstances.

With a view to the best economy, it was decided to utilize a chamber, known as the hide-room, within a building at the Outer Wharf owned by R. P. Rithet & Co. The cost of preparing the chamber for efficient work was $550, the rent to be $150 per year, thus providing for an extra 100 tons capacity. Had the original plan of erecting a new building been carried out, the cost would have been $3,000, with a ground-rent of $100 per year.

The Mount Royal Milling Company increased their accommodation for fumigating imported rice by providing an extra chamber of 75 tons capacity in addition to the 100-ton capacity chamber they had already in use, thus proving their desire to keep their mill and premises free from infestation.

IMPORTERS REQUEST FUMIGATION.

One particular feature in connection with the large importation of rice, beans, peanuts, etc., from the Orient was the evident desire of several importers to have their consignments fumigated before placing in storage or forwarding to consignees who might object to the product being infested with weevil or moth. These men are beginning to realize the tremendous waste and individual loss resulting from insect pests in stored products.

AUSTRALIAN WHEAT.

The importation of wheat from Australia was an event of considerable interest, and also a demand on our ready recourse to deal with weevil with which it was infested. Previous to its arrival your inspector was notified that the Dominion Department of Agriculture requested a report of facilities at the Government elevator, Vancouver, for fumigating, superheating, or otherwise disinfecting wheat infested with weevil, in anticipation of the wheat coming from Australia being infested. Investigation proved that no special facilites for superheating or fumigation existed at the elevator or Government dock, other than that it was possible to fumigate wheat in the bins with carbon bisulphide, but just how large a quantity could be successfully treated in each bin was doubtful. Besides, sufficient carbon bisulphide could not be obtained on short notice. The Provincial Government fumigating chambers, already busy with other importations, could not handle such large shipments of wheat as were on the way within reasonable time to meet commercial requirements.

The first shipment of Australian wheat arrived from Sydney on August 21st ex the ship "Geraldene Wolvin," carrying a cargo of 1,562½ long tons in 22,000 sacks. This was landed at the Government dock and proved to be badly infested with weevil, quite a sprinkling of *Plodia* moth and *Tribolium* beetle, these insects being accompanied by several parasitic flies of the chalcid species.

As the whole consignment was en route to England, and the time for dealing with the infestation somewhat limited, it was decided to run the wheat through the fanning-machine into the Government elevator-bins, and from there load it in bulk into the S.S. "War Camp" conveying it to England. By this process practically all the adult weevil and other insects were separated from the wheat and carried with the screenings into a separate bin, where they were ultimately fumigated with carbon bisulphide. There were 36,730 lb. of screenings from the 1,562½ tons of wheat. They were a living mass of weevil, but the carbon-bisulphide treatment very successfully disposed of them all.

Sample of wheat taken September 18th after combing over the screens of the fanning-machine did not develop any new weevil until four weeks later, when a very small number of the adults began to appear, and continued to increase until December 31st, when they recorded 588 to 1 lb. of wheat. Most of the badly excavated grains of wheat were blown over the screens into the tailings, which process would no doubt dispose of many eggs and larvæ of the weevil. All the empty sacks, many of them swarming with weevil, were fumigated with carbon bisulphide at the Provincial Government Fumigating Station.

Between August 21st and December 17th there arrived at Vancouver from Sydney, Australia, two ship-loads of wheat in 48,109 sacks, weight 3,440 long tons; from Melbourne, Australia, three ship-loads in 106,543 sacks, weight 8,244 tons. One thousand eight hundred and seventy-eight tons from the Sydney shipment was divided between the Vancouver Milling & Grain Company and the Distillery at Sapperton, New Westminster. The balance of the Sydney and Melbourne shipments has gone to England in S.S. "War Camp" and S.S. "War Storm," with the exception of 4,881 tons that arrived at Vancouver on December 17th in the S.S. "Yankalilla" and is awaiting consignment.

SYDNEY WHEAT INFESTED.

All the wheat from Sydney, Australia, was considerably infested with weevil and treated similarly to the first shipment already described. This gave the Vancouver Milling Company the opportunity of grinding their wheat before the next batch of weevil had time to hatch out, which would be one month after the wheat went through the fanning-machine at the Government elevator.

MELBOURNE WHEAT FAIRLY CLEAN.

The wheat from Melbourne, Australia, was comparatively free from weevil-infestation, and apparently a very fair sample.

Cold-storage Experiments.

Several experiments have been made during the last few years to determine the best methods of dealing with infested stored products. One of our recent tests was commercial cold storage of imported rice infested with weevil, moth, and beetle. The result obtained was that the insects in the sacks of rice, piled so that the air could circulate among them, and exposed to 10 degrees below freezing, were killed after fourteen days' exposure to that temperature.

Superheating.

Exposure to 130° Fahr. resulted in death of all insects after three hours. This latter test, however, was made with small quantities only, and it is doubtful just how long an exposure would be necessary in connection with large amounts in bulk or sacks. Many rice-millers claim that heating rice spoils it for milling because the heat cracks the enamel of the grain, but they do not object to the cold storage.

Carbon Bisulphide.

Fumigating with carbon bisulphide, with a thirty-six-hour exposure, has proved to be the most effective and satisfactory method, provided the consignments were only a few hundred tons in weight and could be conveniently hauled to an air-tight chamber suitable for the operation.

Fumigation by Steam.

High-pressure steam gives excellent results as a means of disinfecting empty ship's holds or chambers that have recently contained badly infested stored products, and can be easily and safely applied.

Large Importations.

During the last year the exceptionally heavy consignments of rice, peanuts, etc., from the Orient have given us considerable trouble owing to a large proportion of them being infested with insect pests. Consignments very badly infested were fumigated with carbon bisulphide at the Government fumigating chambers. Other consignments only slightly infested, and too large to handle at the Government chambers within a reasonable time, were either placed in cold storage or isolated in cool warehouses that would become cold as the season advanced. This method avoided the infested product from coming in contact with the clean product and prevented further infestation.

Importation of Nursery Stock.

The tabulated list of imported nursery stock attached to this report gives the amount of stock imported in 1918 as compared to that of 1917. A glance at the respective figures shows very little variation with regard to the number of standard fruit-trees one year with the other, only amounting to 1,892 trees in favour of the year 1917, the same year also having an extra 752 nut-trees to its credit. Fruit seedlings and scions for 1918 were considerably in excess of the previous year, our British Columbia nurserymen preferring to propagate them instead of importing standard trees.

Embargo on Currant and Gooseberry Stock.

Small-fruit stock was well patronized, there being 10,000 more blackberry-bushes imported than the year before. In all probability currant and gooseberry stock would have shown quite an increase had it not been for the embargo prohibiting their entry into Canada.

The embargo which had been in force since July, 1917, was amended by Dominion Order in Council of June 6th, 1918, permitting the importation of gooseberry and currant stock from that part of the United States west of the line and excluding the States of Minnesota, Iowa, Missouri, Arkansas, and Louisiana.

Provincial Regulations.

Following a recommendation from the Dominion authorities and the approval of our Provincial Agricultural and Forestry Departments, the embargo on all five-leaved pine, gooseberry, and currant stock will in future include all such stock grown east of the Ontario western boundary. This will be a continuation of the line of demarcation running directly north and south through the United States, and is considered to be the western boundary of areas in

which the white-pine blister-rust is prevalent. The gooseberry and currant stock is associated with the white-pine blister-rust by acting as host-plant in the propagation of the spores of the disease.

ORNAMENTAL STOCK.

There was a marked increase in the importation of all ornamental trees, shrubs, and plants —a good indication that financial conditions are improving in British Columbia.

NURSERY STOCK CONDEMNED.

The percentage of standard fruit-trees condemned would average only about 3½ per cent., ranging from a fraction of 1 to 5 per cent. Small fruit and ornamental stock, with the exception of grape and gooseberry, did not run more than 3 per cent. for any one variety, and much lower on the average. The condemnation of grape stock amounted to about 17 per cent. owing to *Phylloxera* infestation, and gooseberry 9½ per cent. owing mostly to the embargo. Very little San Jose scale was in evidence as compared with many other years. Woolly aphis on apple-roots accounted for many of the trees being condemned.

Crown-borer, root-gall, anthracnose, sour sap, and *Lecanium*, *Aulacaspis*, *Diaspis*, *Chionaspis*, and *Ostræformis* scale-insects infecting and infesting the other varieties of stock resulted in their condemnation also.

A comparatively new insect during the last few years is a species of the woolly aphis attacking the roots of young pear-trees. It is presumed by some entomologists to be a European pear-aphis (*Eriosoma pyri*), and is even more destructive than the woolly apple-tree aphis. It often kills young pear-trees in a single season by consuming the tender fibre of the root-feeders. Quite a little of this aphis was found on pear-trees imported from Oregon, U.S.A., and the trees were condemned accordingly.

IMPORTED FRUIT AND VEGETABLES.

Another tabulated list accompanying this report gives the number and varieties of fruit, vegetables, etc., inspected at the several ports of entry into the Province, as compared to the previous year. This shows an increase in the number of apples, apricots, Japanese oranges, and grapefruit imported during the year 1918. California oranges were less than half the quantity of the previous year. There was a very large increase in the number of potatoes imported. These were practically all for the evaporators at New Westminster, Vancouver, Kelowna, Vernon, Sardis, and Chilliwack. New Westminster was by far the heaviest importer. Only 132 tons of potatoes from the United States and 82 crates from the Orient were for British Columbia consumption or open market.

FRUIT, ETC., CONDEMNED.

The condemnation of apples and pears was more extensive than the previous year, for which codling-moth was mostly responsible. There were very few peaches or apricots condemned for their old enemy, the peach-worm. Japanese oranges were remarkably free from scale-insects, resulting in very few being condemned.

PRODUCTS FUMIGATED.

Several cases of nutmegs from Singapore were simply alive with weevil, and after being fumigated were refused entry owing to the nuts being so badly excavated and filled with the castings of the insects as to render them totally undesirable for grinding and afterwards being used as spice to sprinkle on all kinds of puddings or custards.

This particular weevil infesting the nutmeg is of considerable economic interest owing to its being apparently a member of the *Bruchus* family and related to the pea and bean weevils, and deserves very close attention.

All peas and beans are very closely inspected upon their arrival from points outside the Province, and if infested with weevil (*Bruchus pisorum* or *fabæ*) are thoroughly fumigated with carbon bisulphide. Many tons from the Orient and some from the United States have been thus treated.

Other products fumigated were Oriental rice infested with rice-weevil, *Plodia* worm, and other larvæ, and beetle; peanuts mostly infested with *Plodia* worm. Several bales of rabbit-skins from Australia infested with *Larder* beetle were fumigated by request before going into bonded warehouse, where they were to be held for New York consignee.

Vancouver Office.

The Vancouver office, the headquarters of your Inspector, is situated in the Court-house. Reports from all outside Quarantine Officers are first forwarded to this office, where they are recorded and filed. The Form J, with duplicate certificates and individual compensation vouchers, are then sent on to Victoria to be audited and filed. All other details referring to the work of inspecting the several horticultural and field products imported into the Province are recorded in their proper order.

Specimens of insects and plant-diseases are received for identification and information given regarding them. Information on horticultural subjects is given by letter and interview.

Over 1,000 bulletins on miscellaneous subjects were given out on application during the year. All applications for information regarding the several subjects, including importation of fruit, nursery stock, and other horticultural and field products, receive prompt and courteous attention. For the year 1918 there were 613 letters received and 737 sent out.

J. W. Eastham, Provincial Plant Pathologist, shares the office with your Inspector and Vancouver staff, part of the office being equipped as a laboratory for his use.

All my assistants performed their work conscientiously and thoroughly, and I am proud to be the head of such a trustworthy staff.

Respectfully submitted.

W. H. Lyne,
Inspector of Imported Fruit and Nursery Stock.

REPORT OF DAIRY INSTRUCTOR AND INSPECTOR.

T. A. F. Wiancko.

W. T. McDonald, Esq.,
Live Stock Commissioner, Department of Agriculture, Victoria, B.C.

Sir,—I beg to submit herewith my report as Dairy Instructor and Inspector for the year 1918.

General.

A reasonably healthy condition has prevailed in the dairy industry of the Province during the past year, and it is confidently expected that when full reports are to hand a small increase in total dairy production will be noted. Weather conditions during the winter were favourable for milk production. The spring was, however, very cold and backward, making necessary the feeding of the cows in the stable much longer than is usual owing to lack of early pasture. This was almost immediately followed by a prolonged period of drought during the summer months, which seriously curtailed the summer milk production. Hay and fodder crops were seriously shortened, and at this time it seemed that there would be a great shortage of winter feed. Farmers in some districts sold off many of their dairy cattle or went out of the business altogether, thinking that it would be more profitable to sell their crops at high prices than to feed them for milk production. August rains, however, improved growth to such an extent that second crops were secured in many cases. Pastures improved greatly and corn and root-crops resulted in abundant yields. A fine, mild autumn further helped to relieve the feed situation, and as a result dairy cattle are going into the present winter with a reasonable supply of the rougher dairy feeds. Mill-feeds, owing to war conditions, are still very scarce and high-priced, and until this phase of the feed problem becomes normal, feeding for heaviest milk production will not be followed.

The labour problem has continued to be a serious one for the dairy-farmer, and early in the year, owing to conscription, many young men were called from the dairy-farms and could not be replaced by competent hands at any reasonable wage. This condition made it extremely difficult for the farmer to carry on as he knew he should do in order to increase production for war needs. Too much praise, however, cannot be given these dairymen, who in the face of such heavy odds, and in spite of small profits, kept our great dairy industry from going behind.

Prices for Dairy Products.

Butter prices during 1918 throughout the Province have ranged about 10 per cent. higher than during the previous year, and have resulted in returns to the producer of cream more

reasonably commensurate with the higher prices of feed and labour. Cheese prices ranging from 25 to 27 cents wholesale have made it possible to produce a quantity of cheese in competition with cream for butter-making.

Milk prices for city consumption have also ranged somewhat higher than in the previous year, and on the Lower Mainland owing to curtailment of the output of the milk-condenseries, a great deal of milk that previously went into evaporated-milk manufacture was converted into butter and cheese. For this reason, also, it will be found, when returns are complete, that the output of butter and cheese has largely increased, but at the expense of the output of the evaporated product.

CREAMERIES.

The regular inspection of creameries has secured as much attention as time would allow, and the majority of them were visited at least twice during the year.

No new creameries have been established during the year. The Cranbrook Creamery was closed owing chiefly to the lack of cream for butter-making. It is hoped, however, that it will be reopened in the near future with renewed vigour and with a greater chance for permanent success.

A further number of the existing creameries have installed improved pasteurizing apparatus and other needed equipment. Sanitary conditions at the creameries and condenseries were found to be quite satisfactory.

Continued improvement in the quality of British Columbia creamery butter has been noted, and it is a source of great satisfaction to note that at some of the most important dairy exhibitions, both in British Columbia and Alberta, our butter-makers have won some of the best prizes.

Butter-makers have continued to evince a keener interest in their work and have shown a greater desire to improve. A system of cream-grading with payments according to quality is being followed with very beneficial results in a number of our best creameries, and it is safe to say that such a system will soon become general.

In order to render assistance in the improvement in quality, flavour, and workmanship in British Columbia creamery butter, the British Columbia Dairymen's Association, of which your Dairy Instructor is Secretary-Treasurer, arranged for a season's butter competition which would extend over a period of five months. The competition was open to all British Columbia creameries, and entries consisted of one 14-lb. box of butter, solid packed, salted, to be made between the 1st and 15th of each month and sent to cold storage as directed by the Secretary, not later than the 20th of the month, to be held there until judged at the end of the season. The object of extending the competition over a number of months was to ascertain the relative keeping qualities of the butter put up during the different months of the season and in the different creameries. Detailed records of each churning of butter from which the exhibits of butter were made were kept for the purpose of reference and comparison, and these in themselves are of considerable educational value to the creamery-men, in that it affords an opportunity to study the methods of the successful competitors.

Altogether eleven creameries participated in the competition, and in order to make it interesting a generous prize-list was arranged. Generous aid in this connection was given the association by members of the wholesale produce trade and dairy-supply houses in the way of cash and special prizes. The association undertook to meet all expenses of the competition, as well as provide championship prizes for the competitors who would make the highest average scores for the whole season.

A butter-judging competition, to be participated in by the several competitors, was also arranged to take place at the close of the competition, and a generous prize-list for this was also arranged. This competition was of great educational value, in that it granted the competitors an opportunity of comparing their skill as butter-judges with that of the official judge. A competition of this kind tends to fix uniform grade standards for butter according to present-day market requirements in British Columbia.

C. Marker, Dairy Commissioner of Alberta, who is considered one of the best butter-judges in Canada, placed the awards and was present to answer questions and give advice. The quality of the butter, he said, was a credit to the makers, and a good deal of it was good enough to win honours in any of the largest exhibitions or competitions in Canada. He was very pleased to note a very great improvement in the quality of British Columbia creamery butter, more par-

ticularly during the past two years. This was brought about largely by improved methods of pasteurization and more careful cream-selection. Cream must be pasteurized to a temperature of at least 170° Fahr., and held for at least ten minutes at that temperature before cooling, in order to ensure keeping quality in the butter. By this method it is possible to make butter which will conform to a uniform standard at all times, regardless of the period of the year.

A list of the prize-winners in the season's competition and butter-judging competition is given in Appendix No. 9.

A large number of inquiries have, as in former years, been received regarding the establishing of new creameries in new districts. This would indicate that the number of dairy cows are increasing in certain districts to the point where the manufacture and sale of dairy butter is becoming an increasingly difficult problem. This is particularly true in several districts along the Grand Trunk Pacific and Pacific Great Eastern Railroads, and it is hoped that very soon creameries will be established in these sections, either by private enterprise or by co-operation with Government assistance.

A list of the active creameries, condenseries, and cheese-factories of the Province is given in Appendix No. 10; also a summary of creamery report for the year 1918 in Appendix No. 11.

Cheese-making.

During the year the Ferrara Cheese Company, Limited, Chilliwack, continued the manufacture of fancy cheese of several varieties with an increased output. The Revelstoke Creamery continued the manufacture of cheese in sufficient quantity to supply the local demand.

In the early spring the Fraser Valley Milk Producers' Association found themselves with a considerable quantity of surplus milk on hand owing to the decrease in the demand for evaporated milk. The old Eden Bank Creamery at Sardis was fitted up as a cheese-factory, and a Cheddar cheese of excellent quality was made during the summer season. The season's output amounted to 212,000 lb.

City Dairies.

Milk-distributing plants, particularly in the larger towns and cities, are in a good sanitary condition, and continue to show improvement in the way of new and up-to-date equipment and facilities for the rapid handling of milk.

Much discussion and controversy has taken place in the City of Vancouver in the past year or two regarding the feasibility of amalgamating the present distributing dairies into one large organization for the whole city, in order to eliminate the waste due to duplication and multiplication of milk routes, and the consequent excessive overhead charges connected with the present system. That some such scheme will shortly be successfully worked out is evident by the earnest manner in which both the producers and city people are at present considering the whole matter. The result should mean a reduction in the price of milk to the consumer, as well as allowing a greater margin of profit to the producer.

Cow-testing Associations.

The work of the Cow-testing Associations at Comox, Langley-Surrey, and Ladner has been carried on with very gratifying results during the past year. At Chilliwack the work has suffered somewhat owing to the difficulty experienced in securing a permanent and efficient tester in place of one who resigned to engage in other work. During the last half of the year, however, the work has proceeded with much of its former enthusiasm.

The Test Supervisors of the several associations are giving their best efforts to the work, and as time goes on the members of the testing associations are realizing to a greater extent the value and benefit of dairy records. The dairy-farmer is coming to a realization of the fact that with abnormally high prices for all dairy feeds, and with high labour costs, it becomes more and more necessary that only the best cows are kept in the herd, and that progeny from the best cows only be raised for future breeding.

As in former years, cash prizes were awarded by the British Columbia Dairymen's Association for the three cows in each class producing the highest amounts of butter-fat in each of the several Cow-testing Associations. Appendix No. 12 gives a list of the winners for 1918, and shows a very gratifying increase in average fat production over the former year.

OFFICIAL TESTS.

As in previous years, testers are being supplied for Holstein-Friesian Record of Merit tests, and during the year such tests have been carried on at Colony Farm, Essondale; Experimental Farm, Agassiz; and at the farm of J. M. Steves, Steveston.

A new official record of 21,161.8 lb. milk and 704.652 lb. butter-fat for yearly production in the junior two-year-old class was completed during the year by the remarkable heifer, "Colony Aaggie Pietertje," owned by the Colony Farm.

The following table shows her monthly production throughout the year:—

"Colony Aaggie Pietertje," No. 38774, C.H.F.H.B.

	Milk, Lb.	Fat, Lb.
October 21st, 1917, to November 19th	1,800.8	59.165
November 20th to December 19th	1,953.5	62.674
December 20th to January 18th, 1918	2,127.8	73.205
January 19th to February 17th	2,001.8	70.121
February 18th to March 19th	1,888.7	62.635
March 20th to April 18th	1,787.0	55.787
April 19th to May 18th	1,641.6	55.708
May 19th to June 17th	1,718.6	56.955
June 18th to July 17th	1,674.4	55.343
July 18th to August 16th	1,466.6	50.570
August 15th to September 15th	1,407.8	46.712
September 16th to October 15th	1,429.4	47.446
October 16th to October 20th (5 days)	263.8	9.331
Total, 365 days	21,161.8	704.652

This record entitles "Colony Aaggie Pietertje" to be placed as: (1) The only two-year-old heifer in Canada with a strictly official yearly record above 20,000 lb. milk and 700 lb. butter-fat; (2) the Canadian champion junior two-year-old for the production of either milk or butter-fat in one year; (3) the world's champion junior two-year-old official test for one year.

CANADIAN NATIONAL RECORD OF PERFORMANCE.

Testing under the supervision of the Dominion Live Stock Branch in the Canadian National Record of Performance has received hearty support by British Columbia breeders of pure-bred dairy cattle during the past year, and many noteworthy records have been made by British Columbia cows. Lack of space forbids mention of them at this time. A total of sixty-two dairymen have had cows entered during 1918, as against fifty-six and forty-four in the years 1917 and 1918 respectively.

"DAIRIES REGULATION ACT."

Testers' Licences.—The licensing of milk-testers under the "Dairies Regulation Act" has been continued under the supervision of the Dairy Division. During the year twenty-two candidates came forward for examination and have qualified for licences. A list of testers licensed during 1918 is given in Appendix No. 13.

Dairy and Creamery Licences.—Dairy and creamery licences were issued to forty-four persons and firms buying milk and cream from the farmers in the Province on the basis of the butter-fat contained therein. A list of dairies and creameries licensed under the Act in 1918 is given in Appendix No. 14.

OFFICIAL MILK-TESTERS.

J. B. Watson, Sardis, and E. Rive, Vancouver, official milk-testers appointed under the provision of the "Dairies Regulation Act," have continued to render efficient services during the year in determining butter-fat tests of milk and cream, checking up weights and tests, etc., for both producers and purchasers.

BRITISH COLUMBIA DAIRYMEN'S ASSOCIATION.

The British Columbia Dairymen's Association has enjoyed a very successful year during 1918. The membership roll now stands at 353, representing an increase of eighty members over the previous year.

The annual convention was held in Chilliwack on February 6th and 7th, and was one of the most largely attended ever held by the association.

The twelfth annual report of the association was prepared and published. This includes a full statement of the affairs and finances of the association and is supplied to all the members.

Fall Fairs.

During the season of fall fairs assistance was given at the following fairs in judging dairy products or dairy cattle: Vancouver, Chilliwack, Cowichan, Kelowna, Comox, and Saanich.

Dominion Dairy Conference.

On the invitation of the Hon. T. A. Crerar, Dominion Minister of Agriculture, your Dairy Instructor attended the Dominion Dairy Conference at Ottawa, November 25th to 28th, inclusive. This Conference was of national scope, since it was made up of delegates representing all branches of the dairy industry in all the Provinces, including the producers. Some fifty-odd delegates in all were present.

Some of the outstanding accomplishments of the Conference may be briefly summarized as follows:—

(1.) A number of important changes were suggested in the legal standards for dairy products as used by the Department of Inland Revenue. These apply to milk, cream, homogenized milk, homogenized cream, condensed and evaporated milk, sterilized milk, butter, and cheese.

(2.) Scales of points were adopted for scoring cheese and butter, which it is proposed shall be used throughout Canada. Grade standards and grade descriptions of cream were also adopted.

(3.) The pasteurization of milk or cream in the manufacture of all butter made in Canada was recommended.

(4.) As a means of helping to prevent the rapid spread of tuberculosis among swine, the Dominion Government will be requested to make it compulsory to pasteurize all dairy-factory by-products.

(5.) A Dominion-wide organization, embracing all interests of the dairy industry, and to be known as the National Dairy Council, was formed, and for which officers were duly elected and preliminary expenses provided for.

Office-work.

There has been a largely increased amount of correspondence during the year. A large number of inquiries were received and answered on matters connected with dairying in the Province in general, and the administration of the "Dairies Regulation Act" has added a considerable amount of office-work.

Respectfully submitted.

T. A. F. Wiancko,
Provincial Dairy Instructor and Inspector.

REPORT OF SOIL AND CROP DIVISION.

E. W. Hogan, B.S.A.

W. T. McDonald, Esq.,
Live Stock Commissioner and Acting Deputy Minister,
Department of Agriculture, Victoria, B.C.

Sir,—I have the honour to submit herewith the annual report of the Soil and Crop Division for the year ending December 31st, 1918.

Demonstration Stations.

As announced in the annual report for 1917, the only demonstration station operated under the direction of this Division is that located at Pitt Meadows. Work on those situated at Armstrong, Chilliwack, Edgewood, Grand Forks, Rock Creek, Rose Hill, and Errington was terminated at the end of last season.

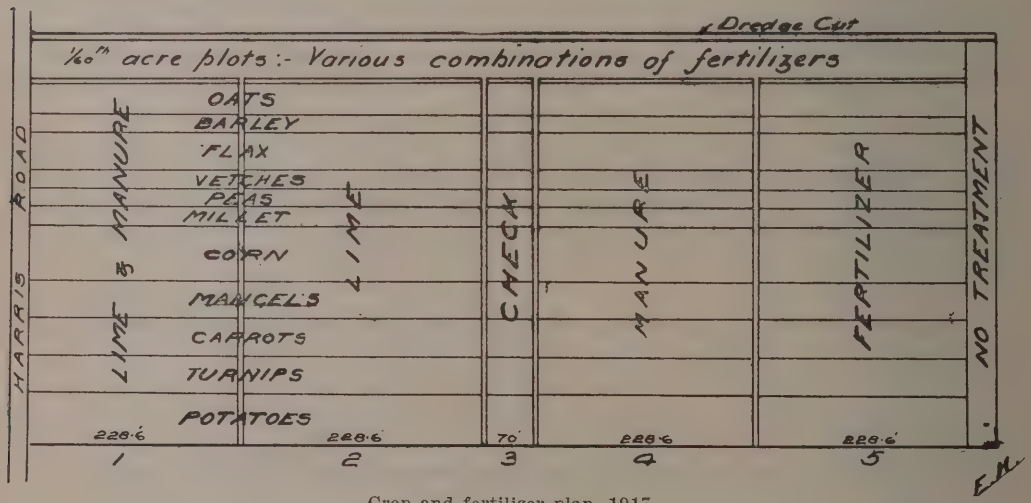
The demonstration farm at Pitt Meadows is located on the farm of F. V. Harris. The surface soil is of vegetative origin, partly decayed, and averages in depth about 18 inches; the subsoil is a silty clay. It is representative of a block of land, about 13,000 acres in area, lying between the Pitt and Fraser Rivers. All this area was at one time flooded by the high water

from these rivers, but about the year 1894 dykes were built around the rivers, dredge-cuts put through the district, and pumping-stations to lift the water, conducted by the dredge-cuts to the dykes, over the dykes into the river. However, even with this safeguard, development has been very slow. All the land needs drainage before successful results can be obtained from it.

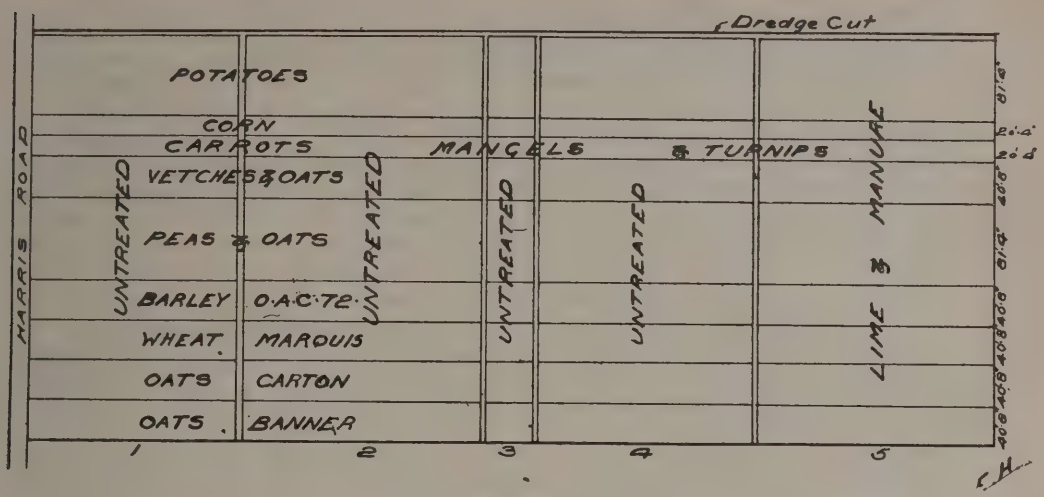
In the season of 1916 the plot of 10 acres was taken over on the Harris Farm, a system of tile drains installed, and work carried on as described in last year's report. In January and February of 1918 all the plot was flooded for weeks by thaws, bringing water down from the mountains behind the Meadows. Large fence-posts were floating over the field; yet within a few weeks of the flood receding the land was ploughed, showing the efficiency of the tile drains in removing excess water. It should be pointed out that the outlet of the tiles is into the dredge-cut; when the latter is running full, drainage of the land automatically ceases. Therefore, to have complete drainage of this area, the pumps emptying the dredge-cuts must be capable and made to keep the dredge-cuts no more than one-third full. Also, more dredge-cuts are necessary to supply outlets for all the area affected. There is not an acre of this area that will not amply repay expense of reclamation.

In the season of 1918 the work conducted on this plot was less of an experimental nature than in 1917. The crops grown were such as would be needed by a farmer running a full complement of farm animals. Satisfactory results were obtained along this line. In conjunction with this, fertilization of a nature within the reach of any real farmer was practised. Barnyard manure at the rate of 20 tons per acre was applied to those portions that were not manured in 1917. Lime was applied, 1½ tons per acre, to areas not receiving any in previous season. The applications were put on in such a way that information was obtained as to the effect of each of those fertilizers in the season applied *versus* effects carried into following season. No commercial fertilizer was used as the extensive tests of 1917 showed negative results.

The following charts show the way the 10 acres was divided, fertilized, and cropped in the seasons of 1917 and 1918:—



Crop and fertilizer plan, 1917.



Crop and fertilizer plan, 1918.

The following table gives the results obtained in 1918 with the various crops:—

Table 1.—Treatment, 1917 and 1918, and Crop Results in 1918.

Crop.	A. Lime, 1½ tons; Manure, 20 tons, Spring of 1917.		B. Lime, 1½ tons, Spring of 1917.		C. Check. No Lime or Manure.		D. Manure, 20 tons, in Spring of 1917.		E. Fertilizer in Spring of 1917, No Results. Lime, 1½ tons; Manure, 20 tons, in Spring of 1918.	
	Yield per Acre.		Yield per Acre.		Yield per Acre.		Yield per Acre.		Yield per Acre.	
	Tons	lb.	Tons	lb.	Tons	lb.	Tons	lb.	Tons	lb.
Peas and oats for hay	4	1,650	3	0	2	251	4	1,265	5	900
Vetches and oats for hay	4	393	3	0	2	142	4	720	4	1,156
Garton oats	0	1,804	1	247	1	122	1	9	1	258
Banner oats	0	1,481	0	1,663	0	1,633	0	1,720	1	133
Wheat, Marquis	0	1.336	0	1,588	..	....	0	705	0	1,284
Barley	0	1,518	0	1,210	..	....	0	415	0	733
Corn	12	829	7	810	3	1,405	8	1,424	6	1,068
Carrots	..	....	..	....	..	....	..	....	..	....
Mangels	..	....	..	....	..	....	..	....	..	....
Turnips	..	....	..	....	..	....	..	....	..	....
Potatoes	..	....	..	....	..	....	..	....	..	....

* NOTE.—Yield so small they were threshed together. On Plot A lodging of the oats caused a decreased yield.

With hardly an exception, the results all show that barnyard manure gives better results than lime or fertilizer, but applications of lime also bring profitable returns. It is satisfactory to know the treatment most beneficial is one within the reach of every farmer. Manure being needed does not mean, in this case, that the soil is a poor one. The reverse is true, but the soil is a dormant one. Being flooded for perhaps ages, organisms causing decay and nutrification are not present, or at least not in sufficient quantities, and the only practicable means of seeding the soil with these organisms is by applying manure. It seeds the soil with the bacteria necessary to unlock the store of plant-food and renders it available for use of growing crops.

Two seasons is too short a time in experimental work to base conclusions on, but results have been such as to justify the following deductions:—

(1.) Drainage is absolutely essential.

(2.) That applications of barnyard manure, coupled with good tillage, is the best treatment that can be given. Lime can profitably be applied.

(3.) Forage, silage-crops, and grain-crops under the above treatment can be grown quite successfully.

(4.) This points out that for ultimate success as large a part of the crops grown as possible must be returned to the land in the form of manure. This again means keeping of cattle and swine and selling little or no unfinished products.

DEPARTMENT CLOVER AND BEAN THRESHER.

The clover and alfalfa huller owned by the Department was operated in the Armstrong District. After threshing what clover and alfalfa crops had been grown for seed it was fitted with attachments for threshing beans. It gave fair satisfaction at this work and threshed a large acreage of beans in the Vernon, Oyama, and Kelowna Districts.

FIELD-CROP COMPETITIONS.

In the bulletin, published in April, 1918, giving the results of the field-crop competitions for 1917 one change was made in the regulations for 1918 competitions. The number of entries necessary for a competition was increased from eight to ten. This had the effect of decreasing the number of competitions.

Competitions were conducted by thirty institutes, with forty-eight competitions and 510 entries. The crops used were as follows:—

Kind of Crop.	No. of Competitions.
Potatoes	27
Oats	7
Wheat	6
Grain-hay	4
Mangels	1
Carrots	1
Corn	1
Beans	1

It seems as if this line of work was not bringing about the improvement of seed that might be expected. In too many cases the competitors enter the competition as a matter of course, or to oblige the Secretary of the institute. There are many exceptions to this, and some men could be mentioned who through this work have become consistently careful seed-growers. In every case the crops on their farms give striking evidence of what may be done by selection of seed and use of a seed-plot.

Officials of the Horticultural Division assisted the members of the Soil and Crop Division in the judging of the competitions, and through their aid no extra judges were employed.

PROVINCIAL SEED COMPETITIONS.

During the season of 1918 competitions in seed-growing, in which any member of a Farmers' Institute without action of his institute could compete, were carried on. The classes included crops not listed in the field-crop competitions—i.e., mangel-seed, carrot-seed, and like crops. As root- and vegetable-seed growing is yet only carried on in a small way, the classes were not very well filled. Some excellent entries of different crops were scored, and it seems reasonable to believe competitions in small-seed crops can be made a useful way for information to be carried to the individual grower by the men doing the judging.

SEED FAIRS.

The seed fairs, usually held in December, had to be postponed until January, 1919, on account of the Spanish influenza epidemic.

CO-OPERATIVE VARIETY TESTING.

This work was continued in the present season, but in different lines. Very little seed was sent out by this Division, but the men who received seed in the spring of 1917 and had good results were asked to supply neighbours with small samples of the varieties they had. In this way the number of co-operators was increased with very little cost. The reports on results obtained are not all received yet, and, as the work of compiling these is considerable, it will be impossible to give a synopsis of results in this report.

Experimental Work in Control of Late Blight on Potatoes.

Late blight of potatoes is present every season in the Lower Fraser Valley, and in many seasons causes great loss to growers of this crop. In the season of 1917 it was very prevalent, and the loss by rot, due to the fungus of this disease, was in many cases over 50 per cent. of the stored tubers. This was in addition to the loss in the fields before harvesting.

For the purpose of demonstrating to the growers that this disease could be controlled by spraying the growing plants with Bordeaux mixture, a series of experiments were undertaken by this Division, advised and assisted by J. W. Eastham, Plant Pathologist. Plots were selected at Chilliwack, Sardis, and Atchelitz, as representative of the district lying east of the Vedder Mountain. Four plots were selected in the Cloverdale and Surrey Centre Districts, representative of a large district where blight is usually prevalent.

The results obtained were variable. On some plots no late blight appeared, and therefore the results were negative. In general, spraying was not started early enough in the season. On the plots in the Chilliwack District conclusive evidence was obtained that spraying is effective in combating the disease. Potatoes in the sprayed portions of the plots were green and vigorous when the unsprayed plants were blackened and killed by the blight. A detailed account of these experiments will be found in the report of the Plant Pathologist.

It is hoped that, with one season's experience as a guide, much better results will be obtained in the seasons to come. This season's work has brought out evidence that will be of great value in future experiments.

Meetings and other Work.

A series of meetings were held in the Fraser Valley and addressed by officials of this Division. The subjects were "Potato-growing" and "Control of Potato-diseases." Other meetings were addressed in different parts of the Province in response to invitations from institutes. At thirteen of the fall fairs members of this Division acted as judges and rendered what assistance they could to the management.

A very important feature of the work of this Division is one that no estimate in figures or of results obtained can be given—namely, farm visits. During spring and summer months and in all parts of the Province many farmers are visited, local and personal problems discussed, and, it is believed, only in this way can much assistance be rendered.

Respectfully submitted.

Everett Hogan,
Soil and Crop Instructor.

REPORT OF CHIEF VETERINARY INSPECTOR.

Dr. A. Knight, V.S.

W. T. McDonald, Esq.,
Acting Deputy Minister, Department of Agriculture, Victoria, B.C.

Sir,—I beg to submit the report of the Veterinary Division for the year from January 1st to December 31st, 1918.

During the year, besides attending to contagious diseases among domestic live stock, some little time has been devoted to examination and prescribing for stock-owners in the outlying districts where it was impossible to obtain a veterinarian. The owners of stock appreciated this movement on the part of the Department.

Influenza.

This disease has been prevalent among horses, more especially on the Mainland. A number of the Provincial Inspectors were requested to demonstrate the application of the serum treatment as a preventive measure. I am not in a position to say to what extent this treatment has been beneficial in preventing the spread of this trouble. Some report good results; others again, thought it was of little avail. Only by keeping such animals that have been treated under observation can one demonstrate the effectiveness of this treatment.

This disease was not in such a severe form as last year, and very few fatalities, the after effects of this disease causing most of the deaths. Some disease affecting horses was reported from the Alberni District. Upon investigation the trouble was found to be primarily due to coarse and indigestible fodder, which the animals were obliged to subsist on, causing digestive troubles. The ground where the animals were obliged to pasture was very low. By the removal of horses from such conditions no further trouble was reported.

INTERNAL PARASITES AMONG SHEEP.

During the year several cases of losses among sheep were reported. Upon investigation stomach-worm (*Hæmonchus contortus*) was found to be the cause. In infested animals these worms are found in the fourth stomach. The parasites are from ½ to 1½ inches in length. Sheep, goats, cattle, and other ruminants are found infested with it. Stock grazing on pastures over which infested animals have run usually become affected. Moisture favours the development of the embryos.

Low ground should be drained if used for pasture. Burning over the pasture will destroy most of the young worms on the ground and grass. Animals should be changed to fresh pasture as often as possible, and a plentiful supply of salt should be kept for the flock at all times. The administration of copper sulphate is found to be effective. By taking 2 oz. and dissolving this in a gallon of water, lambs six months to one year are given 2 oz. of solution; mature sheep, 2½ to 4 oz. of solution.

RABBITS.

Several reports were received regarding fatalities among rabbits. Severe losses occurred among several breeders. On post-mortem the intestinal tract showed bacterial infection. Treatment was advised and a thorough disinfecting of hutches and premises. This checked the trouble and the losses have been greatly reduced. This infectious disease gave every indication of causing heavy losses amongst those engaged in raising fancy stock, and, if not dealt with promptly, no doubt would have entailed heavy financial loss among those engaged in the industry.

ENTOZOA IN CATTLE.

Cattle pastured on low or swampy ground are more liable to become infested with various forms of internal parasites, such as worms in the lungs or bronchi and producing verminous bronchitis. Young stock are more usually affected; also cattle on such lands are more liable to intestinal parasites. A number of these cases have been dealt with during the year. Preventive measures were advised and treatment given. By adopting prompt measures very few fatalities occurred, yet considerable financial loss is incurred through loss of flesh and rendering the animals unfit for beef, also greatly diminishing the milk-supply of dairy cattle and impairing the growth of young stock.

Tapeworm was also found. I may mention one herd which had been a financial loss to the owner for a number of years. One of the younger animals was destroyed, and on post-mortem tapeworm was found in the intestinal tract. All the animals in the herd exhibited the same symptoms in some degree. After adopting treatment as advised the herd is now on a profit-producing basis and the owner appreciates the assistance rendered by the Department.

PLANT-POISONING.

From time to time cases of poisoning are reported, evidently from plants. The most common is due, no doubt, to water-hemlock. Samples of the supposed source of poisonings have been sent to the Department and identified as such. As the poison in this plant is very active, medical remedies are of little avail, except when administered immediately the animal has eaten of the plant. The general advice is to keep stock off the ground where these plants are prevalent; plants can be dug up or fenced off, as the area where these plants grow is usually localized. Although we have other poisonous plants in British Columbia, these are apparently causing very little loss of stock. A number of farmers have reported losses of pigs which were apparently caused through feeds that were purchased. In two cases the feed appeared to contain large quantities of mustard-seed. No doubt the screenings from mills ground up and mixed with other refuse. Mustard-seeds contain active poisons, and these probably account for the losses among swine. The moral would point to avoid purchasing cheap feeds without first knowing the ingredients.

Goitre.

Goitre among swine and other domestic stock has proved a handicap to stock-raising in some parts of the Province. The iodine treatment, I believe, is proving effective in relieving this condition. If the dam is fed with this drug during her gestation period the offspring are born in most cases normal and thrive after birth. So far the iodine treatment has been tried almost exclusively on sows. I would recommend that an opportunity be offered to extend the experiment to breeding mares, usually in those sections where we have such large losses among new-born foals.

Hæmorrhagic Septicæmia.

Although several outbreaks of this fatal malady were experienced in 1917, only one outbreak of this trouble was found during the past year and confined to one animal. As is usually the case with this disease, this animal was found on low-lying pasture. As reported last year, preventive measures can only be adopted by keeping animals off these infested spots.

Actinomycosis.

Only two cases were reported during the past year, and these were disposed of by consent of the owners, as the cases were beyond treatment.

Tuberculosis.

During the year 1,907 premises were visited and 15,705 head of cattle were tuberculin-tested; 568 reactors were found, the Inspectors covering ground that was not tested over in 1917. Considerable time is taken and expense incurred in testing for parties with one or two cows. Very little, if any, milk is sold by these parties. A good deal of this testing in small herds is carried out at the request of the city health authorities, and also by written or verbal requests from the owners themselves. Reported cases of tuberculosis have also been received from settlers in isolated districts. Much time is taken up with this work and an outlay of expense incurred out of proportion to our regular testing operations.

On Vancouver Island there have been 514 premises visited; 4,314 head of cattle tested; 184 reactors. On the Lower Mainland or Fraser Valley, 1,157 premises visited; 9,683 head of cattle tested; 356 reactors. In the Upper Country, including the Okanagan, Kootenay District, and Columbia Valley, 482 premises visited; 1,762 head of cattle tested; 32 reactors.

In the Lower Fraser Valley the testing for tuberculosis was confined there largely to those herds where tuberculosis had been found in previous years, the owners and the Department wishing to clean up these herds. In certain sections in this district the percentage of reactors in some herds was found in 1914 to run about 51 per cent. The percentage of reactors in these same sections has now been reduced to about 5 per cent., and in a number of herds where the disease was so prevalent they can now show a clean bill of health. The Okanagan Valley is now practically free from this disease. Covering 161 premises visited, 657 cattle tested, only four reactors were found.

Sanitation of Stables and Dairies.

The Inspectors report a steady improvement in the sanitary conditions of the stables and dairies. The utensils used in connection with the dairy have been found, on the whole, in good condition. The older dairies where milk has been stored are being gradually replaced by more sanitary and up-to-date buildings.

The same might be said of the stables, and I trust in a few years that the stables that were put up by the pioneers will gradually give place to more modern and sanitary buildings.

We have only received two complaints from the City Health Officers in regard to the unsanitary production of milk. These places were promptly attended to and have been greatly improved, no further complaints being forthcoming. (For list of the districts and premises visited, with the number of cattle tested and reactors in each district, *see* Appendix No. 15.)

Respectfully submitted.

A. Knight,
Chief Veterinary Inspector.

REPORT OF DISTRICT AGRICULTURIST, KAMLOOPS.

GEO. C. HAY, B.S.A.

W. T. McDonald, Esq.,
Acting Deputy Minister, Department of Agriculture, Victoria, B.C.

SIR,—I beg to submit herewith my annual report as District Agriculturist for the year 1918.

THE CANADIAN CO-OPERATIVE WOOL-GROWERS, LIMITED.

To learn the feeling of the sheepmen in the Province of British Columbia with respect to forming a Dominion-wide Co-operative Wool-growers' Association necessitated a personal interview with as many of the sheepmen as possible. Much of your Agriculturist's time was taken up with this work during the early winter, and later in February he was delegate to a convention of Canadian wool-growers held in Toronto for the purpose of discussing the co-operative marketing of Canadian wool. The result of the convention was the formation of the Canadian Co-operative Wool-growers, Limited, which is a joint-stock company, amalgamating the different Provincial associations into a Dominion-wide organization, with head office at Toronto. At this convention your Agriculturist was appointed director of the company for the Province of British Columbia.

Since returning from the East, and more particularly during the spring months when the wool-clip was being marketed, I was busily engaged in the interests of the wool-growers of British Columbia and the Canadian Co-operative Wool-growers, Limited.

INSTITUTE MEETINGS.

During the past year various institute meetings were arranged, and on eighteen different occasions addresses were given on agricultural topics. A series of meetings were held early in June in the Okanagan, Similkameen, and Nicola Districts, and later meetings were held at points along the Cariboo Road to Quesnel. These meetings, generally speaking, were fairly well attended and good interest was shown.

FALL FAIRS.

The fairs visited during the past season were: Knutsford, Vancouver, Quesnel, Duncan, Saanichton, Kelowna, and Surrey. At each of these fairs, with the exception of Vancouver, your Agriculturist judged live stock or field products, or both.

BOYS' AND GIRLS' CLUBS.

A very successful pig-raising competition was carried on with a number of boys in the vicinity of Kamloops. D. W. Strachan, of Tranquille, furnished pigs to the boys, who paid for same at the time of marketing.

A very keen interest was taken by the boys, and the following results will demonstrate their success:—

Name and Address of Boys who received Pigs.	Weight of Pig when received.	Summer Score, July, 30th.	Finished Score, Nov. 7th.	Average Summer and Finished Score.	Weight of Pig, Nov. 7th.
	lb.				lb.
B. E. Connor, Sullivan Valley	28½	92	91	91.5	176
W. Pike, Kamloops	25½*	..	..	..	..
A. Colquhoun, Kamloops	25 †	..	..	..	..
M. Sault, Kamloops	24	93	81	87	142½
B. Church, Kamloops	22 ‡	..	..	..	..
L. Inskip, Kamloops	22 §	..	..	..	..
J. Wight, Knutsford	21	95	96	95.5	182¼
H. Emmerick Kamloops	20	88	82	85	148¼
G. Brown Kamloops	18	88	76	84	135½
A. Sieble, Kamloops	17	94	65	78.5	117

* Sold on account of changing house. † Died. ‡ Accidentally killed. § Accidentally choked to death.

The Provincial boys' and girls' competitions judged were: The boys' and girls' pig-raising competition at Nakusp, Needles, Grand Forks, and Martins Prairie; and the calf-raising competition at Tappen. At each of these places favourable expressions of opinion were heard with respect to the good work of the Department of Agriculture with the boys and girls in the different localities throughout the Province.

SALES.

The holding of periodical agricultural sales in Kamloops was started by the Central Farmers' Institute and conducted by the Markets Committee, of which your Agriculturist is a member. Several more or less successful local sales were held before it was deemed advisable to endeavour to make the sales of Provincial importance. Recently the British Columbia Live Stock Show and Sales Association has been formed, and your Agriculturist has been appointed Secretary. The aim of this association is to encourage the better breeding of live stock in the Province, by holding periodical shows and sales, and by protecting the British Columbia breeders of live stock in every way possible.

OFFICE.

The above lines of work, together with the supervision of the dry-farming stations at Quilchena and the 105-Mile House, and the frequent inquiries for information at the office in Kamloops, has kept your Agriculturist especially busy during the past year. The local farmers and those interested in the work of the Department of Agriculture have been patronizing the Agricultural Office, with an increasing interest in the work; and the furthering of the agricultural interests in this district by the Department of Agriculture is greatly appreciated by all concerned.

QUILCHENA DRY-FARMING STATION.

General.—Another very dry season similar to that of last year has been experienced at the Quilchena Dry Farm. The spring opened fairly early, but was followed by a cold dry spell which retarded growth very much. Later, during the midsummer, a prolonged spell of dry weather occurred, which was so effective that practically all the grain had to be cut for grain-hay. Following the harvest season was a spell of wet weather which started a second growth, and practically all the grain-fields were cut for hay a second time. The hot, dry midsummer very severely burned the ranges, but at all times there was ample feed for the stock.

Live Stock.—A flock of seventy-nine head of grade Shropshire sheep were wintered last winter, which consisted of the following: Fifty mature ewes, twenty ewe lambs, seven wether lambs, and two pure-bred rams. From this flock fifty-four lambs were raised this season. During the summer 151 head were purchased at a cost of $2,207. Later in the fall, from the flock of 284, 142 head of the poorest ewes and butcher animals were sold for $2,304.44. There is now on the farm a flock of 138 ewes and four pure-bred rams, which is valued at $2,831. A detailed statement of the sheep follows herewith:—

Sheep Statement, December 31st, 1918.

	Cost.
79 head on farm December 31st, 1917	$1,049 50
50 head purchased from R. Ferguson	750 00
64 head purchased from 105-Mile Dry Farm	896 00
36 head purchased from 105-Mile House	486 00
1 ram lamb purchased from Western Stock Ranches	75 00
54 lambs from above ewes	540 00
	$3,796 50

Sheep and Wool sold since December 31st, 1917.

	Returns.
46 ewes sold at Kamloops sheep-sale	$ 791 94
76 head sold to H. S. Cleasby (butcher)	1,170 50
4 rams sold to R. L. Clarke	125 00
1 ram sold to J. A. Guichon	25 00
2 ewes sold to Wm. Foster	32 00
1 lamb sold to Clinton Hotel	10 00
12 head sold to H. S. Cleasby (undelivered yet)	150 00
650 lb. wool	390 15
	$2,694 59

Sheep on Farm December 31st, 1918.

	Value.
4 pure-bred rams at $50	$ 200 00
100 ewes at $20	2,000 00
25 ewes at $19	475 00
13 ewes at $12	156 00
	$2,831 00

Horses and other Live Stock.—No horses have been sold during the past year, and in addition to the six that were wintered last winter there are two mare colts raised last summer. The other live stock on the farm consists of a cow and yearling heifer, a couple of spring pigs, and a number of hens.

Field Crops.—Thirty-five acres of land were seeded to different varieties of grain last spring, but unfortunately the weather prevented it from maturing, so it was all cut for grain-hay. About an acre was seeded to kitchen-garden stuff and different roots, and these did remarkably well, as they were in a hollow where they had plenty of moisture. About 10 tons of turnips, carrots, sugar-beets, and potatoes were harvested from less than half an acre. In the spring of 1917 10 acres were seeded to a mixture of timothy, orchard-grass, and red-top seeds. These grasses came along very nicely the first summer, but last season did not grow sufficiently to make it worth while cutting.

During the summer 30 acres were summer-fallowed, and this fall 10 acres were seeded to fall wheat and rye. These crops went into the winter looking exceptionally well. They are well covered with snow and a good crop is expected for next year. Fall grain as a rule does better than spring grain on this farm.

Also during the summer 20 acres of new land were stoned, broken, and put in shape to be cropped next spring. Quite an area of good land might be very easily brought under cultivation on this farm, and it is the intention to break up a little each year.

Potato Experiment.—An interesting experiment with different varieties of potatoes was carried on, and the results obtained follow herewith:—

Potato Experiment conducted at Quilchena Dry Farm, 1918.

Variety.	Measurement of Land occupied by Potatoes.	Date of Planting.	Date of Digging.	Total Weight of Crop.	Per Cent. Marketable Potatoes.	Yield per Acre.	Remarks.
				Lb.	Per Cent.	Tons.	
Early Surprise.	18 hills 2 feet apart	May 15..	Oct. 1st.	65	84.6	13.108	Good size; no scabs; fair crop.
New Queen ...	23 hills 2 feet apart	"	"	98	86.7	15.466	Ditto.
Table Talk....	18 hills 2 feet apart	"	"	95	85.2	19.15	"
Money Maker..	24 hills 2 feet apart	"	"	120	85.8	18.15	Extra good size; no scabs; the best crop.
Drought Proof.	14 hills 2 feet apart	"	"	45	77.7	11.667	Very good, but very few; no scabs; fair crop.
Gold Coin.....	26 hills 2 feet apart	"	"	21	76.1	2.931	Small size; no scabs. Gold Coin potatoes usually grew successfully here. This sample an exception.
Million Dollar.	16 hills 2 feet apart	"	"	52	86.5	11.797	Large size; no scabs; good variety, but few.

105-MILE DRY-FARMING STATION.

General.—The 105-Mile Dry Farm has been under the managership of J. W. McKinley during the past year, and his report, which follows these general remarks, shows the work done on this farm for the year 1918.

This farm also had the experience of another dry season, and in addition had a very severe hail-storm on August 10th, which damaged the grain-crops considerably. Besides, the farm had the misfortune to lose an exceptionally good brood mare at foaling-time, and the majority of the lamb-crop, mainly by coyotes.

A flock of fifty-nine sheep were wintered last winter, which was made up of the following: Forty mature ewes, two yearling wethers, sixteen lambs, and one pure-bred ram. On September

10th this flock was moved from the 105 Station to Quilchena Station, and then numbered sixty-four head. No sheep were sold from the farm, and the increase of five on the above flock was decidedly disappointing.

The results of the grain-crops are included in the manager's report, which follows herewith:—

"Manager's Report of 105-Mile Dry-farming Station.

(Copy from J. W. McKinley's Report.)

"During the past year I cut sufficient wood to last two years. Cut and peeled many fir fence-posts to replace the pine and poplar posts rotted off; quite a number of these have been used. Balance of them are on hand.

"Built two much-needed corrals, one stable, one implement-shed, chicken-house, wood-shed, stock-shed; remodelled old stable by putting in new mangers, stalls, and floor, all made of hewed timber; cut 2,530 pickets and wove them into the woven-wire fence 2 feet apart. This kept the sheep off crops and has greatly improved the appearance of the farm. Built verandah across front of house and made and hung nine substantial gates. Built new stockyard containing 11,025 square feet. No stock reached any of the stacks this season.

"Summer-fallowed 30 acres stubble land; cleared and summer-fallowed 6 acres new land, grubbing small and medium-sized trees and cutting large trees so low that implements pass over them; took off all large rocks and did not require blasting; picked loose rocks before and after ploughing; removed all straggling trees in old fields that were formerly ploughed around; put out manure from barnyard, also old stack-bottoms, for the first time in the history of this farm.

"All the fields are in much better shape for cultivation than ever before; 36 acres ready for crop, 28 acres for summer fallow next season, and about 10 acres seed to grass.

"Fall wheat and rye were medium, barley light, tame hay a failure. All other grains extra good until struck by that awful hail-storm of August 10th. The report on yields is a farce, as it does not represent the amount that grew; oats would have yielded 50 to 55 bushels per acre and spring wheat 20 to 35 bushels. You will note that seed raised on this farm gave best yields. Barley-seed had beards on and could not pass through drill as well as threshed grain would. Therefore there was no chance for a good yield.

"*Grain threshed on 105-Mile Experimental Farm, Season of 1918.*

Geo. C. Hay,
District Agriculturist.

REPORT OF SILO DEMONSTRATOR.

R. J. FERRIS.

W. T. McDonald, Esq.,
Live Stock Commissioner, Department of Agriculture, Victoria, B.C.

SIR,—I beg to submit herewith my annual report for the year 1918.

During the past year the work of this branch was carried in some cases into districts which were difficult to reach through lack of transportation facilities. Two silos were built in the Cariboo country, more than 180 miles north of Ashcroft. The men who built these silos have erected modern dairy-barns, purchased pure-bred dairy stock, and hope to be the means of the farmers in this part of the Province adopting up-to-date methods, so that it will be possible to have a co-operatively owned creamery established at Quesnel.

The Salmon River Valley stretches into the mountains away from the railroad for thirty-eight miles west of Armstrong. A silo was built at Falkland, about half-way up the valley, and the filling demonstration was well attended. Many of the farmers in this district are including a silo in their programme for increased development during 1919. Altogether eleven silos were erected and seven filled during the past season. Silos were built at Gordon Head, Alexandria, near Quesnel, Strawberry Vale, Procter, Hillbank, Ducks, Chemainus, Malakwa, Wilkinson Road, and Albert Head; filling demonstrations being held at Keremeos, Kamloops, Albert Head, Falkland, Procter, Summerland, and Lytton.

There are two districts in British Columbia where the farmers have not yet realized the advantage of using silage to feed their live stock. I refer to the large tract of land which is being developed adjoining the Grand Trunk Pacific Railway, and also the district around the east end of the Kootenay Lake, Creston, and Cranbrook. There is a very large growth of forage in the north, due to a plentiful rain-supply, and when the grains fail to mature, or rain interferes with the haymaking, the silo would take care of the crops. In the southern district they have a warm, dry climate during the growing season and such crops as corn and alfalfa produce heavily. Summer silage could be fed in this district to advantage; in fact, it would be necessary from an economic standpoint to use silage in many cases throughout the year. Educational work is being carried on in these districts, and at present three applications have been received for silos in 1919.

Greater interest is being shown by the farmers in the feeding of silage to beef stock. Silos have been built this year in several places to provide succulent feed for cattle that, as a rule, have been fed principally on dry hay during the winter. Several of the larger stock-ranchers are at present considering the advisability of using silage when wintering their stock. Steers wintered on alfalfa silage in the Vernon District brought a good market price in the early part of last year. Silos would be useful to those ranchers who are directly interested in the development of the Bulkley Valley and Nechako Districts as a stock-raising country.

One of the strong arguments advanced against building a silo is the expense of machinery for filling. In 1917 a silo was built and filled under the supervision of the Department's representative at Willow Point, near Nelson. Last year five more silos were built by farmers in this locality, the largest being 9 x 27 feet. These were all filled with corn by a machine which was co-operatively owned by farmers in this district. Interchange of labour saved cash expenditure for help. These men, who are each keeping a few head of dairy stock as a side-line on their fruit-farms, have proved that by co-operation it is profitable to build a silo 8 x 20 feet.

In 1915 Frank Tarry assisted the Department representative to fill the first silo in the Arrow Lake District, erected at Thrums, near the south end of the Arrow Lakes. This year he purchased a first-class filling outfit and filled fifteen silos in the district. By using a large-sized machine the silos were quickly filled, thereby keeping down the expense. The presence of a large number of silos in this locality is due in a great measure to the missionary work of Mr. Tarry. Many of our farming communities are so placed in the Interior that a community silo-filling outfit would be a good solution to the expensive machinery problem. The machine is only to be used once or twice in the year and by working together an improved co-operative spirit should grow among the farmers.

There has been a large increase during the last year in the number of silos in the Province. The system which has been followed during the last four seasons by the Live Stock Branch of the Department of Agriculture, of assisting in the building and filling of silos in new districts,

has introduced them into the majority of our farming communities. Up to the present ten silos have been built and eleven filling demonstrations held in farming districts near the main line of the Canadian Pacific Railway. From Enderby south to Penticton, including the Okanagan, nine silos have been erected and the filling demonstrations have been well attended. From Revelstoke south six have been built in the Arrow Lakes District, and other farmers have built and are contemplating building silos this year. Three have been placed at different points in the Columbia Valley and six in the Fraser Valley. Many of the other valleys on the Mainland have been visited and a silo has been built and filled in order to leave a practical lesson of the benefits to be obtained by feeding silage. Fifteen silos have been erected on Vancouver and adjacent islands and a large number of filling demonstrations held. We have up to the present time built sixty-three silos and also held fifty-one filling demonstrations. Ontario is the only Province in Canada that has more silos *per capita* than British Columbia. By maintaining the present rate of progress this honour will be annexed by this Province in the near future.

Those farmers who have had their silo or silos to assist them through the winter of 1918-19 have been able to meet the extraordinary demands which have been made upon their finances when purchasing other live-stock feeds, especially for dairy herds.

A circular bulletin entitled "Silage aids Production" was published during the year. This contains a lot of information with reference to silos and silage which has been gathered during the time the Department of Agriculture has been endeavouring to increase the popularity of the silo in British Columbia. More than 2,000 copies have been distributed.

Besides circular letters, more than 300 letters have been received and 400 dispatched.

All of which is respectfully submitted.

R. J. Ferris,
Silo Demonstrator.

REPORT OF PUBLICATIONS BRANCH.

R. J. Ferris.

W. T. McDonald, Esq.,
Live Stock Commissioner, Department of Agriculture, Victoria, B.C.

Sir,—I beg to submit herewith the following annual report for 1918:—

On the departure of M. A. Stuart from the position of Editor and Chief of Publications Branch on April 30th, 1918, at your request I took charge of this division of the work of the Department of Agriculture.

The *Agricultural Journal* has been in circulation nearly three years and is becoming a familiar publication to the farmers in the various rural communities in British Columbia. Copies are also forwarded to Colleges of Agriculture, Provincial Departments of Agriculture, and the State Libraries in Canada and the United States. In addition to numerous individual subscribers in British Columbia, there are a number of subscribers from the Prairie and Eastern Provinces. By the use of its pages the officials of the Agricultural staff have been able to place educational material on thousands of farms each month. Considering the huge size of this Province, and how the farming community is scattered along the banks of rivers, lakes, and in the many valleys among the mountains, without the use of this *Journal* only a small percentage of the farming community could be approached by the officials at stated times. During the past year the circulation of this publication has increased from 2,500 to 6,000 monthly.

The staff of the Department has supplied the majority of the educational articles which have been used in this publication. We are also indebted to members of the staff of the Dominion Department of Agriculture located in British Columbia, from whom many instructive articles dealing with agricultural development have been received. Numbers of the farmers have forwarded material to be used in the *Journal*. They have placed at our disposal a lot of intelligent information which has been of great assistance to our many readers. The public-spirited action of these men in spending their time in endeavouring to improve agricultural conditions is a cause for satisfaction. We hope to be able to enlist their further co-operation. Increased interest is

manifested by the articles which are being received from members of the Women's Institutes; these are coming principally from the Interior points. They deal as a rule with problems which are facing the rural communities and also the Province. Often after giving a clear statement of conditions in their own section, or as they affect the Province, remedies are suggested which are well worth consideration. There is an earnest desire evidenced in their correspondence to do some real work. One lady, when sending an article, stated: "If you think this article will do any good, use it, for my heart is in the work."

A keen interest in this publication is being taken by the members of the Farmers' Institutes. It is hoped that by an intelligent use of the *Journal* it may be the means of drawing the institutes into closer co-operation with one another. This organization, with its 152 societies and a membership of more than 6,000, wants to find in the *Journal* a means of keeping in touch with the business condition of the farmers in British Columbia. At the present time the institutes are reorganizing along more efficient lines. With the influx of numerous soldier-farmers who are returning from the battle-fields of Europe, the institutes hope to be the leading factor in the advancement of rural conditions in our Province. Special attention will be given during the coming year to reports which are forwarded to the Department of Agriculture by the Secretaries of the Farmers' Institutes. These will be carefully read and whenever possible extracts will be published in the *Journal*. There are many ways by which a journal devoted to the farming interests alone can further schemes for the improvement of agriculture in British Columbia.

There have been numerous requests from different Colleges of Agriculture, libraries, and individual subscribers for printed indexes to Volumes I. and II. These have been prepared and are being forwarded to those who need them, upon request.

A new list of the various publications which are issued by the Department of Agriculture was arranged and published in the early part of the year.

At the request of Captain Oliver, who represented the Khaki University, London, a large supply of bulletins and circulars were forwarded to Europe, to assist in the education of the soldiers in agriculture. They were to be used by the many branches which have been established by the University in England, France, Belgium, and within the borders of Germany. Nearly 3 tons of literature were dispatched. It was also arranged that, if circumstances did not allow for the using of all this material for that purpose, the balance was to be forwarded to the Agent-General for British Columbia at his London office.

There have been numerous requests for bulletins; these have been forwarded. Four hundred and seventy-five letters have been received and 375 mailed.

All of which is respectfully submitted.

R. J. FERRIS,
Acting-Editor and Chief of Publications.

REPORT OF SECRETARY FOR THE DEPARTMENT OF AGRICULTURE.

WM. J. BONAVIA.

W. T. McDonald, Esq.,
Acting Deputy Minister, Department of Agriculture, Victoria, B.C.

SIR,—I have the honour to submit herewith my report on the general work of the Department for the year ending December 31st, 1918.

STAFF.

The Estimates for the fiscal year ending March 31st, 1919, provided for forty-eight permanent officials of all ranks, being an increase of four over those for the preceding year. The year has again been marked by a large number of resignations. On the death of the Hon. H. C. Brewster, Premier of this Province, the Hon. John Oliver resigned his position as Minister of Agriculture and was succeeded by the Hon. E. D. Barrow on April 25th. Wm. E. Scott, Deputy Minister and Superintendent of Institutes for many years, was also obliged to resign his appointment owing to ill-health on August 31st.

Resignations.

Date.	Name.	Rank.	Remarks.
Jan. 31	G. S. Rothwell	Clerk	Overseas service.
April 30	M. A. Stewart	Editor (Publications Branch)	Farming.
" 30	G. B. Martin	Clerk	Superannuated.
May 31	J. H. Buckett	Junior Clerk	Overseas service.
June 30	P. E. French	Assistant Horticulturist (Vernon)	Farming.
" 30	Miss M. M. Patchett	Stenographer	
" 30	A. LeWarne	Cow-tester	
July 31	E. Brookland	Foreman (Dry Farm, Quilchena)	Farming.
Aug. 15	E. J. Rossiter	Private Secretary (Minister of Agriculture)	
" 31	Mrs. E. Williams	Stenographer	
" 31	Wm. E. Scott	Deputy Minister	Superannuated.
Oct. 31	H. O. English	Soil and Crop Division	Farming.
Nov. 30	M. S. Middleton	Provincial Horticulturist	"
" 30	Miss. A. V. Evans	Stenographer	

Appointments.—The following staff appointments were also sanctioned during the year, the majority of them being replacements of officials who had resigned, etc., with the exception of Mrs. V. S. MacLachlan, who was appointed Secretary of the Advisory Board of Women's Institutes:—

Date.	Name.	Rank.
Jan. 1	Mrs. V. S. MacLachlan	Secretary Advertising Board of Women's Institutes.
" 7	W. T. Andrews	Accountant.
" 22	Miss A. V. Evans	Stenographer.
Feb. 22	Miss G. Burnyeat	"
March 7	Mrs. C. J. Clark	"
April 1	Miss G. H. Hawes	" Vancouver.
" 1	Miss N. Evans	"
May 1	A. LeWarne	Cow-tester.
July 1	J. A. Munn	"
" 3	A. J. Hourston	Clerk.
Aug. 15	F. W. Laing	Private Secretary, Minister of Agriculture.
" 29	Miss. M. V. Hamelin	Stenographer.

Officials Overseas.—Occasional reports from departmental officials overseas indicate that, whilst actively employed, no serious casualties have occurred. A report at the end of December, however, was received with regard to W. H. Robertson, Assistant Horticulturist, to the effect that he had been severely injured by a shell and that he was slowly recovering in hospital.

Temporary Appointments.—A total of seventy-five temporary appointments were made during the year, as against 109 in 1917; twenty-one of these being carried by the "Agricultural Instruction Act," as per attached statement.

Provincial Estimates—

Inspector, Brands	1	
Inspectors, Imported Fruit	17	
" Nursery Stock at Vancouver	5	
" District Field	8	
Judges, Fall Fair Associations	18	
Stenographers	3

Grand total	75

CORRESPONDENCE.

A total of 8,390 letters were received in the Deputy Minister's office and 9,207 sent out during the year, as against 8,404 and 11,345 the previous year. The attached table shows the total correspondence for the Department at Victoria.

Appendix No. 18 shows full details of the correspondence for the Department at Victoria.

Circular Letters.—The total number of circular letters sent out was 21,010, grouped as follows:—

Agricultural Associations	395
Dairy Division	2,685
Fruit-growers	100
Farmers' Institutes	5,050
Goat-breeders' Association	340
Horticultural Branch	1,060
Miscellaneous letters	1,295
Poultry Branch	1,545
Publications Branch	415
Soil and Crop Division	2,680
Stock-breeders' Association	360
Statistics Branch	2,385
Women's Institutes	2,700
Total	21,010

PUBLICATIONS.

The number of new publications issued during the year has been less than usual, owing partly to the fact that the *Agricultural Journal*, issued monthly, contains a number of articles by experts in the Department that would have, in the past, been issued as circular bulletins or departmental circulars. A total of 71,000 copies of the *Agricultural Journal* were issued during the year, giving an average monthly circulation of 5,916 copies. Special large editions comprising 6,500 copies were published in April and August. The other new publications were as follows:—

Date.	Name.	Description.	No.
1918.			
Jan. 11	Circular No. 19	Honey Production in B.C.	2,000
Feb. 5	Report of Department of Agriculture	For year 1917	1,500
March 4	Circular	*Re* Boy-labour, S.O.S	2,000
" 13	Circular Bulletin No. 22	Medical Inspection of Schools	2,000
" 18	Circulars	*Re* Seed-grain Distribution	1,000
May 2	Bulletin No. 30 (Second Edition)	Guide to Bee-keeping	3,000
" 28	Leaflets	To School Principals *re* Production	700
July 5	"	*Re* Farmers' Labour Bureau	6,000
" 29	Bulletin No. 80	Market Rabbits	5,000

Horticultural Circulars issued in 1918.

No.	Name.	No. issued.
6	Spray Calanders	3,000
31	Peach-twig Borer	2,000
32	The Cabbage-root Maggot	10,000
33	The Strawberry-root Weevil	4,000
34	The Woolley Aphid of the Apple	5,000
35	Currant Gall-mite	1,000
36	The Onion-thrips	2,000
37	The Imported Cabbage-worm	5,000
38	Codling-moth	3,000
39	Apple-aphides	5,000
40	Soap Solution for Spraying	5,000
41	The Oyster-shell Scale	5,000
42	Top-working of Fruit-trees and Propagation	10,000
43	Gardening on a City Lot	10,000
44	Apple-scab	10,000
45	Anthracnose	5,000
46	Egg-plant and Pepper Growing	5,000
47	Cucumber and Cantaloupe Growing in B.C.	5,000
48	Forcing Houses and Frames	10,000
49	Tomato-growing in B.C. Dry Belt	5,000
50	Potato-diseases	10,000
51	Orchard Cover-crops	.....
52	Diseases of Stone-fruits in B.C.	5,000

Bulletins and Circulars dispatched during the Year.—A total of approximately 50,000 bulletins, circular bulletins, and departmental circulars were mailed during the year, being a slight increase on the numbers mailed in 1917. The reissue of the circulars by the Horticultural Branch under the joint supervision of M. S. Middleton, R. C. Treherne, E. W. White, and J. L. Hilborne proved their popularity.

In addition to the above issue, seven large packing-cases weighing almost 3 tons, being a selection of all departmental publications, were sent by special request to the Khaki University, England, to be used as text-books by instructors in connection with soldiers who were taking agricultural courses prior to returning from overseas.

Financial.

The financial appropriation amounted to $219,684, as against $208,002 for the previous year. Special warrants were also obtained during the year for $4,500 in connection with the Coast Markets Commissioner's Office, and other special warrants, as follows:—

Coast Markets Commissioner's Office	$ 4,500 00	
Travelling expenses, Hon. E. D. Barrow	1,000 00	
Compensation for bee-keepers	386 10	
Office supplies	1,750 00	
Travelling expenses, Horticultural and Live Stock Branch	5,250 00	
Agricultural Associations	1,000 00	
Departmental exhibits	750 00	
Compensation for codling-moth destruction	1,500 00	
Grand total for fiscal year		$16,136 10
Supplementary votes—		
Frondeg Farm expenditures	$ 4,000 00	
Purchase of fish fertilizer	3,500 00	
		7,500 00
		$23,636 10

(*See* Appendix No. 19.)

The gross receipts of the Department of Agriculture amounted to the sum of $113,549.36, of which the sum of $53,171.34 was revenue. Of this sum, $21,981.14 was horticultural inspection

fees and licences, the balance being composed of seed-grain refunds, brand registry fees, and miscellaneous.

"*Agricultural Instruction Act, 1918-19.*"—The following payments were received during the year from Ottawa:—

April 6th, second half of grant, 1917-18	$29,349 53
May 1st	1,343 33
August 22nd, advance on account first half of 1918-19 grant	10,000 00
December 11th, " " " "	5,000 00
December 30th, balance of first half of 1918-19 grant	19,599 53
Total	$65,292 39

The number of cheques drawn on the special account of the Department in the Canadian Bank of Commerce during the year was 2,029. The total expenditures under the various sections of the "Agricultural Instruction Act" were as follows:—

March quarter	$13,850 05
June quarter	28,805 00
September quarter	12,935 75
December quarter	12,958 82
Total	$68,549 62

The bank balance on December 31st being $15,233.39.

There has been a very notable increase in the number of vouchers issued both for Provincial and Federal payments. This has been due partly to the more detailed system of accounting required by the Comptroller-General.

"*Seed-grain Act, 1918.*"—This Act, being chapter 75 of the Statutes of 1918, provided a sum not exceeding $50,000 to be advanced to the Minister of Agriculture during the year for the purchase and distribution of seed-grain as might be required and necessary to enable occupiers and owners of land to seed their land. This Act was in accordance with the Dominion-wide campaign to increase food production owing to the shortage of food-supplies throughout the world.

The following amounts were received as seed-grain refunds during the year:—

1915, distribution	$ 262 62
1917, "	4,707 82
1918, "	8,456 92

At the close of the year payments for the 1918 distribution were coming in fairly well, but a large sum is still outstanding on the 1915 distribution.

Increased Food Production, 1918.—The Dominion Department of Agriculture, as a further war measure to increase food production throughout Canada, allotted grants to each Province to be spent for the above purpose on condition that the Provinces themselves put up a similar amount. The grant for British Columbia amounted to $15,000, of which $7,500 was paid during the year. The grant has been used chiefly in carrying expenses in connection with the Soldiers of the Soil movement.

BRITISH COLUMBIA STUDENTS.

Owing to the war very few British Columbia students were enrolled at any of the Agricultural Colleges during the year. The following were the students to whom grants were paid:—

Miss F. L. Fullerton, Home Economics Course, University of Toronto.
Miss F. E. McEwen, Home Economics Course, University of Toronto.
E. C. Hassel, Agricultural Course, Ontario Agricultural College, Guelph, Ont.
Miss G. Hallwright, Home Economics Course, Ontario Agricultural College, Guelph, Ont.

BEE-INSPECTION WORK.

F. D. Todd, of Victoria; L. Harris, of Vernon; and W. J. Shepherd, of Nelson, were again appointed Inspectors under the "Foul Brood Bees Act" for the Lower Mainland, Okanagan, and Kootenay Districts respectively. The production of honey during the year was a record one; the Inspectors estimate that over 200 tons had been produced during the season, whilst the total number of bee-keepers recorded by the Department had risen to 1,611. In the Cloverdale District, near Vancouver, there was a serious epidemic of European foul-brood which required the attention of two Inspectors. The Okanagan and Kootenay Districts were practically exempt from this

disease. Expenses of administering the Act were carried on a section of the "Agricultural Instruction Act" and totalled $3,365.32, and as the total grant for the year was only $2,500 the next year's operations will have to be financed to a certain extent by the Province. A total of $386.10 was paid in compensation to bee-keepers whose hives had been destroyed on account of this disease.

FARMERS' INSTITUTES.

A total of 154 Farmers' Institutes were recorded at the close of the year, being an increase of seven since the close of 1917. The new incorporations were:—

(1.) Mount Ida ..... February 19th, 1918.
(2.) South Bulkley ..... April 23rd, "
(3.) North Fraser ..... " "
(4.) Lardeau-Duncan ..... June 20th, "
(5.) Big Eddy ..... July 11th, "
(6.) Forest Grove ..... October 28th, "
(7.) Creston ..... November 29th, "

Owing to the continued absence of many members overseas a large number of institutes were reported as temporarily closed down, the total number being twenty-two. The total membership recorded for the year was 6,072, as against 6,194 at the close of 1917. The institutes with the largest membership were as follows:—

Spallumcheen	198
Creston	177
Cowichan	145
Delta	136
Kelowna	110
Islands	101
Martin's Prairie	100
Chilliwack	85
Comox	85
Metchosin	85
Victoria	85

Advisory Board.—During the year a scheme outlined by the late Deputy Minister for grouping institutes into nine districts was brought to a successful conclusion, as follows:—

District.	Area.	Member.
A.	Vancouver Island and Gulf Islands	C. E. Whitney Griffiths, Metchosin.
B.	Bella Coola, Bnlkley Valley, Skeena and Nass Valleys	H. Silverthorne, Telkwa.
C.	Prince George, including district from Endako to McBride	J. S. Ross, Fort Fraser.
D.	Kamloops, North Thompson Valley, Nicola Valley, and district between St. Elmo and Revelstoke	Wm. Harrison, Martin's Prairie.
E.	Langley and all institutes on south and north sides of Fraser to Chilliwack and Howe Sound	Jas. Bailey, Chilliwack.
F.	Grand Forks, Arrow and Slocan Lakes and Boundary Districts	C. C. Heaven, Grand Forks.
G.	Kelowna, including Okanagan Valley from Mara to Kaleden, also Salmon River Valley	L. E. Taylor, Kelowna.
H.	Robson, Kootenay Lake, and Kootenay River Institutes	R. Staples, Creston.
I.	Cranbrook, South-east Kootenay, and Columbia Valley	A. B. Smith, Cranbrook.

A meeting of the Advisory Board was called in November and held at Victoria, when a large number of resolutions were dealt with and submitted for the consideration of the Hon. the Minister. A notable feature of the year has been the increased co-operative work carried on by institutes. The annual reports received indicate great activity in all parts of the Province; large purchases of feed and flour and other supplies in car-load lots for members have been successfully undertaken, and at the time of making up this report there is evidence that the movement is branching out into wider schemes, to include the organization of district co-operative societies to undertake buying and selling under the authority of the "Agricultural Act, 1915," and amendments.

The total expenditure of Farmers' Institutes for the calendar year amounted to $9,308.10, or an average of $60.83 per institute. (For full details *see* Appendix No. 20.)

A large proportion of institutes have now raised their fee to $1 per annum in order to obtain the similar grant allowed by the Department.

Gopher-poison amounting to the sum of $454.56 was purchased and distributed at cost price to the institutes in the Kootenays and other districts where this pest is a serious one.

The total amount of stumping-powder supplied to Farmers' Institutes during the year was valued at $23,340.25. During the year the cost per case reached the record figure of $10.25, but owing to the release of raw material hitherto required by munition-factories the price showed a tendency to drop round Christmas, and considerable reduction is anticipated by the spring of next year.

Short Courses and Lectures.—Owing to the depleted staff of the Department no arrangements for this work were made.

Fairs held by Farmer's Institutes.—The following fairs were organized by institutes during the year: Terrace, September 16th; Denman Island, September 21st; Rock Creek, October 11th; Peace River, September. Judges were supplied by the Department in the cases of Denman Island, Terrace, and Rock Creek, who reported exhibits of agricultural produce to be of a high order.

WOMEN'S INSTITUTES.

During 1918 two new institutes were organized, as follows: South Saanich, February 11th; Salmon River Valley, July 11th; making a total incorporated of sixty-two; the total membership for the year being 2,428, as against 2,754 in 1917. The ten institutes with the largest membership during the year were as follows:—

Cowichan	125
Cranbrook	123
Penticton	119
Kelowna	89
Kaslo	82
Vernon	74
Tillicum	72
Shawnigan	71
Creston	66
Nelson	63

The total expenditure on Women's Institutes for the calendar year was $4,826.75, or an average of $77.85 per institute; this being a very considerable decrease on the cost of administering these institutes in the previous year, when the total amount expended was $8,742.03. (*See* Appendix No. 21 for full details.)

Conferences.—Conferences were held as follows during the year: Kelowna, October 8th to 10th; Kaslo, October 15th and 16th. Owing to the Spanish influenza epidemic the conferences for the Lower Mainland and Vancouver Island institutes were postponed until the next year. A number of interesting resolutions dealing with the "welfare of women and children" were submitted and carried. A new feature of the conferences was the election of members for the Advisory Board in accordance with the provisions of the "Agricultural Act" and amendments; Mrs. J. S. Chalmers, of Thrums, replacing Mrs. Jas. Johnstone, of Nelson, as member for the Kootenay District, and Mrs. A. L. Trask, of Oyama, being re-elected for the Kootenay and Boundary District.

Lectures and Demonstrations.—Owing to the continued activity of institutes along Red Cross and patriotic lines the Department did not arrange for any lectures during the year. Owing, however, to numerous requests having been received in the Department in the fall of the year it is recognized that this work must be taken up again in a systematic manner.

Flower-shows.—Thirty-one institutes held flower-shows during the year, as against forty-one in 1917. The Department supplied the usual book prizes and the grant of 25 cents *per capita*. Reports show that these events were conducted in a very satisfactory manner, both from a social and financial side. At many points these flower-shows have broadened out so as to include exhibitions of women's work and increased food production.

Competitions, Year 1917.—Owing to the difficulty of obtaining judges these competitions were not finally decided until late in 1918. The winners were as follows:—

(*a.*) Best Average Attendance at Meetings based on June Membership.—First, Hazelmere, 91 per cent.; second, Gordon Head, 88 per cent. Next in order of merit: Atchelitz, 86 per cent.; Langford, 82 per cent.; Colwood, 75 per cent.; Crawford Bay, 70 per cent.

(*b.*) Programme Competition.—The programmes were judged by Mrs. J. D. Gordon and Mrs. Graves, of Victoria, who expressed extreme interest at the many admirable programmes submitted for this competition. The awards were given as follows: First prize, Salmon River Valley, now Silver Creek Women's Institute. The decision was made on the originality and excellent appearance of the programme, combined with general neatness. Choice of subjects was also carefully made, and the programmes, being hand-made, were especially commended for economy in production and for attractive appearance. Second prize, Metchosin Women's Institute. The subject-matter was excellent and the general artistic appearance in the hand-painted programmes caused favourable comment. Third prize, Tappen Women's Institute. The subject-matter of this institute was exceedingly well got up, and although the paper and type was of a less expensive nature than certain other competing programmes, the judges had no hesitation in giving this third place.

(*c.*) Essay Competition.—First prize, "Meaning of Democracy," Mrs. O. H. Carle, Similkameen Women's Institute; second prize, "Some of our Problems when Peace Comes," Mrs. Sidney File, Nakusp Women's Institute, Nakusp; third prize, "Domestic Science and Household Economics," Mrs. J. R. Tweedale, Salmon River Valley Women's Institute, Salmon Arm; fourth prize, "Maintaining the Health and Happiness of the Household," Mrs. E. N. Applewhaite, Willow Point Women's Institute, R.R. No. 1, Nelson.

(*d.*) Competition for Junior Members.—No prizes awarded.

Horticultural Bonds and Licences.

During the year a total of twenty-eight licences were issued, as against thirty-nine in 1917. These were made up as follows: Principals, foreign and British Columbia nurserymen, 12; agents for foreign and British Columbia nurserymen, 16. The continued drop in the issue of these licences is noticeable, the business being largely concentrated in the hands of two or three firms.

During the year an important amendment to the "Agricultural Act" of 1915 affecting nurserymen was passed. Section 7 of the Amendment Act provides that a bond might be dispensed with upon any nurseryman obtaining a certificate of inspection showing that his nursery was free from all insect pests and contagious diseases injurious to fruit-trees, plants, or nursery stock. Whilst considerable correspondence has ensued, no licences have been issued by the Department under this amendment during the year, but it is anticipated that the concession will be taken advantage of next year to a considerable extent.

Agricultural Fairs.

During the past season forty-one agricultural fairs were arranged for by the Department, judges being supplied to all points as in previous years. Of the above number of fairs, five were organized by Farmers' Institutes where there were no incorporated Fair Associations.

Speaking generally, these fairs have been unusually successful, exhibits being of a higher class than usual, and owing to the warm, dry season all horticultural products were well developed and of a high colour; the educational work carried out by the Department also during the past few years was evidenced in the arrangement and better selection of entries.

Both at Duncan and Saanichton, on Vancouver Island, the fiftieth anniversary of the local association was celebrated, and a splendid display of agricultural products of all kinds gave striking testimony to the strength and popularity of these associations. Owing to reasons of economy judging was almost entirely undertaken by the officials of this Department, with the exception of the following experts, whose services were requisitioned for live stock:—

Dr. S. F. Tolmie, M.P.	Light horses.
Geo. Shannon, Cloverdale	Heavy horses.
Prof. L. Stevenson, Saanichton	Dairy cattle.
P. Moore, Colony Farm	„
Sam Shannon	„

S. H. Hopkins, Duncan	Dairy cattle.
John A. Turner, Victoria	Beef cattle and sheep.
Bryce Wright, Victoria	All classes of stock.
H. W. Hicks, Experimental Farm, Agassiz	Sheep.
W. McIntyre, Chilliwack	Horses.
E. H. Barton, Chilliwack	Pigs.
Joe Bulman, Grande Prairie	Sheep.
H. E. Waby, Enderby	Dairy cattle and poultry.
A. B. Smith, Cranbrook	„ „
F. Fleetham, Revelstoke	„ „
Prof. H. Barton	Dairy cattle.
Dr. H. D. Parker, Wash.	Goats.
H. D. Reid, Victoria	Poultry.
E. A. Orr, Chilliwack	„
W. Walker, Chilliwack	„
W. N. Scott, Trail	„
W. J. McKim, Nelson	Horticultural products.
S. LeC. Grant, Bella Coola	„ „
J. B. Partington, Victoria	„ „

Grants.—A total sum of $10,850 was paid by the Department in grants in aid of prize-lists to those associations holding fairs, the amount being $2,000 less than the total for 1917. (*See* Appendix No. 22 for full details.)

GENERAL.

For financial reasons no convention was held during the year, the arrangements for dates, judges, etc., being by correspondence with the Department. This system, although having the advantage of economy, makes the final arrangements long drawn out, and in many cases it has been difficult to prevent overlapping of dates; whereas, on the other hand, minor differences could easily be adjusted by delegates talking matters over at a central meeting. Owing to the continued decision of the directors of the Royal and Industrial Association at New Westminster not to hold a fair, the position of the Vancouver Exhibition Association has been materially strengthened during the war period, and the 1918 fair was undoubtedly one of the most successful this association has ever held, both from the number and quality of exhibits, as well as from the point of attendance, general management, and financial results. Live-stock features of the exhibition were very prominent, a total of 281 head being shown; breeders from Vancouver Island and other Interior districts sending entries.

All of which is respectfully submitted.

WM. J. BONAVIA,
Secretary.

REPORT OF STATISTICS BRANCH.

A. B. TWEDDLE.

W. T. McDonald, Esq.,
Acting Deputy Minister, Department of Agriculture, Victoria, B.C.

SIR,—I beg to submit herewith the annual report of the Statistics Branch for the year 1918.

SCOPE.

The duties of this Branch during the year consisted of the collection of data relating to agricultural production, imports, exports, and cost of production.

In 1917, in co-operation with the Dominion Bureau of Statistics, figures relating to crop areas and numbers of live stock were collected conjointly by means of a postal census; card schedules being distributed to all farmers whose names appeared as such on the latest Provincial voters' lists. The results were considered so satisfactory that the same plan was continued in 1918.

Data relating to imports from other Provinces in Canada are now being collected by means of returns from as large a number as possible of the chief distributers of agricultural food products in the Province.

With this method results depend entirely upon the goodwill of such establishments, there being no inquisitory power existing within this Province. Various appeals have been made to the transportation companies for such data, but these have so far been unsuccessful.

Data showing "foreign imports" are obtained from the Dominion Department of Customs, and include quantities and values for the calendar year.

1918 Postal Census.

The total number of card schedules dispatched from this office was 21,400, and the total number of returns received and compiled 6,534, or 42.5 per cent. of the estimated number of farmers in the Province—viz., 15,360.

In determining totals, 57.5 per cent. of the total number of farmers was added to the results of the returns compiled in the case of crop areas, sheep, swine, and poultry. Results regarding the number of horses and cattle indicated that there had been gross concealment of facts, since these showed a falling-off of 62 per cent. in horses and 32 per cent. in cattle, which was plainly untrue. These results were therefore discarded and results from the crop correspondents accepted instead, totals being based upon those of 1917.

The percentage of total returns in 1918 was 3.5 per cent. less than in 1917, notwithstanding a more thorough campaign toward increased results. This may well be attributed in part to the shortage of farm-labour, resulting in operators being extremely busy during the month of June, when the census was taken. Increased fear of further taxation may have also contributed to this cause.

Crop Correspondents.

The voluntary services of ninety-six crop correspondents in the various sections of the Province were enlisted by this office in April, 1918, who were asked to report to the Statistics Branch, Victoria, on crop conditions each month except November. Of the total enlisted fifty-nine reported during three or more months from May to October, inclusive (December reports still outstanding).

In addition to these correspondents, ninety-three were appointed by, and asked to report to, the Dominion Bureau of Statistics, Ottawa. By mutual agreement the two offices exchanged results and agreed upon an average for publication. By this arrangement the result in former years of conflicting figures by the two officers was eliminated.

City and Suburban Food Production.

At the request of the Canada Food Board for data relating to city and suburban food production in this Province during 1918, a postal census was taken under the joint supervision of J. W. Gibson, Director of Agricultural Education, and this office. Card schedules were distributed to all small-lot producers possible, in both city and suburban districts of the Province, through the medium of the public schools.

The total number of cards distributed was 31,393, and the total returns received and compiled by this office was 9,770, or 31.1 per cent.

Cost of Production.

This work, which in 1917 was conducted by the Soil and Crop Division in so far as it related to certain field crops only, was at the beginning of the current year undertaken by your Statistician in order that all crops and branches of farming might be included to better advantage. Accordingly the necessary forms were prepared, and whilst the aim was to secure 400 farmers who would undertake the work, only eighty-three finally consented to do so. The actual recording began on March 1st, 1918, to be continued for one year, so that results cannot be submitted at the time of this report.

During this particularly busy time it is difficult to get farmers to undertake this work. Such work possesses invaluable possibilities in educating farmers toward better business principles and management, and no effort will be spared to make it as universal as possible.

Publications.

Owing to pressure of work the data for the 1917 Statistics Bulletin could not be prepared until too late to make it economically wise to print. The 1918 bulletin will, however, be prepared early in 1919 and will include the 1918 data.

The results of the monthly crop returns from correspondents were published each month in the Department *Agricultural Journal*. One circular, "Instructions for keeping Records relating to Cost of producing Farm Products" (No. 20), was issued and published.

OFFICE.

Attention to the details in connection with the rural and city and suburban censuses, as already outlined, and the compilation of results of these and monthly crop returns occupied almost the entire time of your Statistician and that of an assistant for a period of six months.

Respectfully submitted.

A. B. TWEDDLE,
Statistician.

REPORT OF APIARY INSPECTION AND INSTRUCTION, KOOTENAYS AND BOUNDARY.

W. J. SHEPPARD.

Hon. E. D. Barrow,
Minister of Agriculture, Victoria, B.C.

SIR,—I beg to submit my annual report on the above work for the year 1918.

The season just passed has not been quite so good for honey production as last in this territory owing to dry spells that somewhat curtailed the blossoming period of the clovers and other nectar-yielding plants. The honey has all been of good quality, as is usual, and apparently there has not been any honey-dew or fruit-juice stored by the bees this fall, so that winter losses should be few, and, in any case, will not be attributable to this cause, as in some past years.

Bee-keeping is going ahead in this section of the Province, two large apiaries having been installed during the past season in one of the best locations by progressive bee-keepers, who will no doubt make a success of them.

Honey is in increasing demand in the Kootenays and not nearly enough is yet produced locally to keep the home market supplied. The wholesale price at present stands at 35 cents per pound for extracted honey, and at this figure this industry is a good paying investment on the small amount of capital required. There has been a great demand for bees here, and several persons desiring to start bee-keeping have been unable to do so through being unable to obtain them. Bees have been practically unobtainable in pound packages this year from the United States, owing, it is stated, to the transportation companies declining to undertake to deliver them by the shortest and quickest routes. By a new postal order in the United States bees in pound packages can now be shipped through the mails, and if this was extended to Canada this difficulty would be overcome and the present shortage of bees supplied.

A demonstration on bee-keeping was given to the members of the Women's Institute at Harrop on May 8th. Educational exhibits of honey, etc., produced in the Kootenays were made at the Nelson Rose Show held during the Western Irrigation Congress on July 24th, at the Trail Fruit Fair on September 17th and 18th, and at the Nelson Fruit Fair on September 25th and 26th. Great interest has been taken in these exhibits and applications have been received for them at other places.

Experiments have been carried out during the season at the writer's apiary in Nelson with different queen-excluders in connection with swarm-control, the production of sections, etc., and valuable data obtained.

There is very little disease in the Kootenays, only six cases of American foul-brood having been found in three apiaries during the past season. One colony was destroyed and the others have been treated by shaking.

Your Inspector was summoned to Vancouver about the middle of June to assist with inspection-work owing to the serious outbreak of European foul-brood on the Lower Mainland, and was engaged thereon for about a month in the Cloverdale District. A separate report on this work was made and sent in at the time. Owing to this absence some of the bee-keepers in outlying districts in the Kootenays have not been visited this season.

Respectfully submitted.

W. J. SHEPPARD,
Foul-brood Inspector.

REPORT OF SOLDIERS OF THE SOIL MOVEMENT.

Jas. H. Beatty.

W. T. McDonald, Esq.,
Acting Deputy Minister and Live Stock Commissioner,
Department of Agriculture, Victoria, B.C.

Sir,—I beg to submit herewith the report of the Soldiers of the Soil Movement for the year 1918.

Enlistments.

The movement encouraged the enlistment of all boys between the ages of fifteen and nineteen years of age, and recognized, but not accepting any responsibility for, boys between the ages of thirteen and fifteen. Boys who came within the above ages and whose school principal recommended them for passing were, upon having completed two months' satisfactory service as Soldiers of the Soil, given their promotion in school without further examination.

Eighteen hundred boys enlisted and sent in their forms. This number includes boys who were working but who had not previously enlisted. These were later registered and were given the same consideration as others who had enlisted previous to being employed.

Placements.

The boys working on farms totalled 1,137. A number of these were, of course, working on their parents' farms, but they received the same consideration from the "S.O.S." movement as did boys who were working on strangers' farms. The farmers' applications came in very slowly at first, and a number of the boys had secured other employment before they were called up. Before the season ended, however, it was difficult to get boys to supply the demand of the farmers.

Over a hundred British Columbia boys were sent to the Prairie to do farm-work. The railway companies gave a reduced rate going, but charged them full fare on their return. It would be difficult to encourage boys from this Province to go to the Prairie without giving some special transportation rate both ways.

Wages.

The wages for boys ranged all the way from $5 to $75 monthly and board, depending on the boy, nature of the work, and part of the country. Boys whom we sent to the Prairie were generally paid considerably better than those who stayed in British Columbia.

Supervision.

For the purpose of supervising the living and working conditions the Province was divided into seven zones, over each of which was placed a superintendent. Under the superintendent were ranged local committees, and also a local man called a local supervisor, whose duty it was to call on the boy and farmer at frequent intervals, and to straighten whatever difficulties might arise and to make recommendations to the zone superintendent in case any difficulties arose.

Medals.

Public meetings were held at a number of points all over the Province, until such were cancelled by the ban which was placed on public gatherings on account of the influenza epidemic, where "S.O.S." badges were presented to the worthy boys. These boys have shown a great deal of pride in this medal, as it is a recognition of their part in war service.

Conclusion.

The "S.O.S." work in British Columbia was entirely voluntary on the part of our superintendents, local committees, and supervisors, and was therefore subject to the same failings of all voluntary work. The Associate Provincial Superintendent feels, however, that, considering everything, excellent results have been achieved. Over 1,100 boys working on the farms did, without doubt, assist materially in increasing food production, and thereby contribute to winning the war, as requested by the Federal Government.

The Superintendent is very grateful to the Hon. the Minister of Agriculture, the Hon. the Minister of Education, and their assistants, for the valuable co-operation and assistance in carrying out the "S.O.S." programme. Never was anything asked for from either of these Departments that was not given, and given cheerfully.

Respectfully submitted.

JAS. H. BEATTY,
Associate Provincial Superintendent, "S.O.S."

REPORT OF CHIEF POULTRY INSTRUCTOR.

J. R. TERRY.

W. T. McDonald, Esq.,
Acting Deputy Minister, Department of Agriculture, Victoria, B.C.

SIR,—I have the honour to submit herewith our report for the year 1918.

GENERAL CONDITIONS.

Despite the restrictions placed on poultry-feeds by the Food Controller, the poultry industry was able at the end of the year to show a production but a very small percentage less than the previous year. The average price of feedstuffs was higher than during 1917. The matter of rising feed prices is of long standing, however, as evidenced by the following table:—

Price of Feeds.

	1913.	1914.	1915.	1916.	1917.	1918.
Wheat and corn, 100 lb.	$1 75	$ 1 95	$2 20	$2 15	$ 2 25	$3 80
Dry mash, 100 lb.	1 95	1 97	2 80	2 10	2 33	3 00
Wet mash, 100 lb.	2 02	1 93	2 80	2 10	2 33	3 00
Grit and clam-shell, 100 lb.	1 12	1 08	1 10	1 12	1 30	1 25
Beef-scraps, 100 lb.	....	4 50	4 50	4 50	4 50	6 10
Mangels, ton	....	12 00	....	....	12 00	....
Straw, bale	70	65	63	50	65	70

During the spring months weather conditions were on the whole much better than those which prevailed during the same period of 1917. During the hatching period, March and April, the climatic conditions were more favourable than for some years past. There was a long spell of bright, sunny days. Favourable weather during the first two weeks of a chick's life is essential. In practically all parts of the Province the spring and early summer months were very hot and dry, this greatly facilitating the growth and development of the young stock. Owing to the high price of eggs in the spring, very few people packed or preserved as many eggs as they did the year previous, when the prices were much lower.

The number of chicks hatched and reared during the past year would approximate about one-fifth short of the total of 1917.

The commercial man, especially those who culled their flocks very closely, appear to have been a little more satisfied with their year's work than at any time during the war.

Trade with the Prairie Provinces for eggs, day-old chicks, and breeding stock continued to increase.

The egg records made during the winter months at our Egg-laying Contest are beginning to bear fruit. In addition to exporting stock and eggs to the East, stock was also shipped to the Pacific Coast States and to Japan, China, and Hawaii.

During the past year the farmers' markets held periodically in most of the cities throughout the Province have maintained their usefulness, even though in some cases prices charged are no cheaper than those asked at retail stores.

RABBIT-BREEDING.

During the year the boom in rabbit-breeding still continued. Despite the fact that towards the fall a percentage of the beginners desiring to get out of the business somewhat lowered the price of breeding stock, those continuing report an excellent year's business.

During the year the Provincial Association of Rabbit-breeders was formed, and also local associations covering Vancouver and District and Victoria and District. The exhibits of rabbits at Vancouver Exhibition, the Victoria Poultry Show, and the Provincial Show held at Vancouver were by far the largest and best held in any Province west of Ontario.

Fall Fairs.

With the aid of competent Provincial judges, the members of this Division judged the poultry exhibits at the fall fairs and exhibitions. Compared with 1917, most of the shows had a larger number of exhibits, which also excelled the previous year in quality as well. Considerable progress has to be recorded in the matter of improved conditions in connection with the poultry exhibits at the fall fairs. Nearly all of the shows now give classes for single specimens as advised by this Division and the Provincial Poultry Association for years past. As in previous years, the popular breeds were the most numerous shown. It is pleasing also to record the fact that the classes for utility breeders are being well patronized.

Lectures and Demonstrations.

The usual lectures and demonstrations were given to the members of the local Poultry Association, Farmers' and Women's Institutes throughout the Province, as desired.

Provincial Poultry Association.

During the past year the association, despite the continuance of the war and the drain on the manhood of the country, managed to hold its own as regards membership. Three new associations were affiliated and one dropped out. The new associations were Corbin, East Kootenay, Salmon Arm, and Clayburn. The association becoming defunct was Ashcroft.

A big percentage of the local associations continued the co-operative buying of feedstuffs, thereby giving valuable assistance to its members.

The association published its Directory of Breeders as usual, and by advertising through the medium of a number of Provincial papers, and also the farm papers on the Prairies, more copies were sent out than during any other period.

The grouping of district shows was continued, and now that the Provincial Show has been permanently settled in Vancouver, it should be assured of financial success.

The annual convention was again held at the same time and place as the show. Twenty-five associations were represented out of the total of thirty-one. The Provincial Show was the largest held in the Province since it was held in 1911 at Vancouver. The Provincial Association again distributed cash prizes of $5 each to its members competing in the Egg-laying Contest whose pens laid the required number of eggs. Handsomely printed diplomas and fine silk ribbons were also awarded monthly to all competitors qualifying for same. The association presented its members with journal and account books in an endeavour to encourage them to keep closer track of their expenditure and income. Members of the association again did well in the Egg-laying Contests held in various parts of the United States. The writer was, as per constitution, appointed Secretary-Treasurer and Mr. Upton Assistant Secretary.

Egg-laying Contest.

The Seventh Egg-laying Contest ended September 25th, 1918, being of eleven months' duration. The classes were as follows: Class 1, 21 pens; Class 2, 19 pens.

For the first time since the inauguration of the contest seven years ago, the first prize in Class 1 was won by a pen other than White Leghorns. A pen of Mottled Anconas bred and raised in the Province headed the list. All the birds constituting this pen have since been sold to an Ontario breeder for the sum of $300. The first-prize winner in Class 2 was the same breeder that won the Fifth and Sixth Contests. This incident proves more than anything else the importance of both strain and breed.

The usual silver and bronze medals were thoughtfully provided by friends of the contest. The climatic conditions obtaining throughout the contest were an improvement on the year previous. The majority of the fowls, not being needed by their owners, were sold by public auction at the conclusion of the contest. There were five pen entries from the United States—one pen from New Jersey and the others from Oregon and Washington. With the exception of a pen of Leghorns from Ontario, the rest of the entries were British Columbia birds. The report of the contest, together with summary of same, is shown in Appendix No. 24.

BOYS' AND GIRLS' COMPETITIONS.

This, the third season in which the competitions have been held, proved as successful as last year, there being no fewer than twenty-six clubs competing—a total of 257 competitors. Owing to a better season than last, the flocks raised by the competitors were better on the average than in previous years. The usual depredations by birds of prey, coyotes, cats, dogs, rats, minks, etc., were again recorded. The competitors continued to make profitable sales of breeding stock to farmers in their particular vicinity, and the improvement is again noticed in the general flocks kept on the farms. Owing to the influenza epidemic only one visit was made to each club.

The following are the names of clubs organized: Chilliwack No. 1; Chilliwack No. 2; Chilliwack (East); Chilliwack (Lotbiniere); Chilliwack (Central); Comox Bay; Creston; Denman Island; Fort George; Fruitvale; Kamloops; Malakwa; Martin's Prairie; Mission; Needles; Point Grey; Point Grey (Amateur); Tappen; Vancouver (Barred Rocks); Vancouver (Reds); Vancouver (Buffs); Vancouver (Whites); Vancouver (Leghorns); Westbank.

"EGGS MARKS ACT."

During the year the members of this Division have made the usual inspections, a number of these being city markets throughout the Province, with the exception of New Westminster and Vancouver, which come under the jurisdiction of the Coast Markets Commissioner. There appears to be further evidence of the co-operation of the wholesalers and producers in an endeavour to carry out the requirements of the Act.

Owing to the egg shortage elsewhere and the extremely high freight rates, very few importations were made into the Province as compared with other years. With a view to making the Act more effective, quite a number of amendments are being proposed. It is hoped that these will become law at an early date.

PUBLICATIONS.

The demand for bulletins, especially in the early part of the season, was much greater than usual. Owing to the growing importance of the rabbit industry a bulletin and Breeders' Directory was published early in the year. As an evidence of its popularity it might be mentioned that copies have been asked for from all sections of the North American Continent. Particularly numerous were the inquiries from the Provinces of Nova Scotia and Quebec.

The usual monthly reports of the Egg-laying Contest were sent out; articles on poultry subjects were supplied to the newspapers of the Province and the poultry journals of Canada; and special articles were also written for the *Agricultural Journal.*

INSPECTION AND INSTRUCTION WORK.

As often as possible members of this Division have visited poultry-ranchers and city-lot poultry-keepers needing instruction and advice. Mr. Upton, taking advantage of his motor-car, was enabled to make an extremely large number of calls for the year.

POULTRY-DISEASES.

The mildest spring and early summer were not so favourable to the spread of colds and other diseases prevalent the previous year. It is again a pleasure to record the fact that the number of cases of tuberculosis amongst poultry is gradually dwindling. A valuable preventive work has been done by the Department in enforcing the tubercular test for cattle. Practically all cases of this disease amongst fowls can be traced to bovine tubercle bacilli.

The spread of entero-hepatitis (black-head) amongst turkeys is increasing. There are very few flocks in the Province, or for that matter in the Dominion of Canada, that are not affected with this trouble. The members of this Division, wherever possible, advised against the keeping of turkeys on farms of small acreage. Not only is there a great danger of infection amongst the owners' flocks of common fowls, but also amongst the flocks of others situate at a distance.

Coccidiosis is also making its appearance amongst the commercial flocks of the Province. This disease appears more frequently among flocks that are crowded and kept upon soil more or less continuously without giving the land a chance to sweeten up by periodic ploughing and cropping. More attention to sanitation and hygiene should be of valuable assistance in checking this dangerous disease.

Office-work.

This phase of the work has again increased, more especially during the period covered by the announcement of the armistice to the end of the year. The number of returned soldiers calling for advice is becoming very great, and the work developing out of the Secretaryship of the Poultry Association also shows no sign of diminishing. The clerical work incidental to the duties of the members of this Division has also shown an increase.

In conclusion, allow me to again testify to the able assistance of H. E. Upton in the work of the Division, and also to acknowledge the services of W. H. Stroyan, the poultryman in charge of the Egg-laying Contest.

Respectfully submitted.

J. R. Terry,
Chief Poultry Instructor.

UNIVERSITY OF ILLINOIS LIBRARY
NOV 22 1920

APPENDICES.

APPENDIX No. 1.

IMPORTED FRUIT, POTATOES, ETC., INSPECTED AT VANCOUVER, 1917 AND 1918.

Total	$10,850 00
Total, year 1917	$12,850 00

APPENDIX No. 23.

British Columbia Show Groups, Year 1918.

District No. 1.—Vancouver Island, from Duncan north and including Duncan, Comox, Parksville, and Nanaimo.

District No. 2.—Vancouver Island, from Duncan south and including Victoria, Saltspring Island, Sooke, Langford, and Cobble Hill.

District No. 3.—Includes the territory west of the eastern boundary of Burnaby; includes North Vancouver, Central Park, and Point Grey.

District No. 3a.—Provincial Show.

District No. 4.—From North Bend south and west to the eastern boundary of Burnaby, including Maple Ridge, Mission, and Chilliwack.

District No. 5.—From North Bend north and east to Sicamous Junction, including Ashcroft, Kamloops, and Salmon Arm.

District No. 6.—From Sicamous Junction south through the Okanagan Valley to Vernon, including North Okanagan.

District No. 6a.—Kelowna, south to International Boundary, including Kelowna, Summerland, and Penticton.

District No. 7.—From Sicamous Junction east to Alberta on the main line of the C.P.R. and south from Revelstoke to Slocan, including Revelstoke, Golden, Arrowhead, and Nakusp.

District No. 8.—From Kootenay Lake west to Okanagan Valley, excepting that part included in District 7, including Nelson, Trail, Grand Forks, and Greenwood.

District No. 9.—Crowsnest Valley, from Kootenay Lake east to Alberta, south of the main line of the C.P.R., including Fernie and Cranbrook.

APPENDIX No. 24.

SUMMARY OF RESULTS, SEVENTH INTERNATIONAL EGG-LAYING CONTEST, VICTORIA, B.C.

Duration of contest (months)	11
Number of pens	40
Number of birds	239
Number of eggs laid	36,996
Value of eggs laid	$1,541.50
Average monthly revenue	$140.13
Average monthly feed cost	$68.70
Cost of feeding	$755.70
Profit over cost of feeding	$785.80
Average price of eggs per dozen	.50
Highest price received per dozen (November 22nd)	.70
Lowest price received per dozen (March 30th)	.40
Average cost to produce dozen eggs	.24.5
Average number of eggs laid per pen	924.9
Average number of eggs laid per bird	154.7
Average cost of feed per pen (six birds)	$18.89
Average cost of feed per bird	$3.16
Profit over cost of feed per pen	$19.64
Profit over cost of feed per bird	$3.28
Eggs laid by winning pen, Class 1	1,077
Average per bird winning pen, Class 1	179.5
Eggs laid by winning pen, Class 2	1,070
Average per bird winning pen, Class 2	178.3

COMPARISON BETWEEN FIFTH CONTEST (11 MONTHS), 1915-16, AND SEVENTH (11 MONTHS), 1917-18.

	Fifth Contest.	Seventh Contest.
Number of eggs laid	36,382	36,996
Cost of feed	$436.45	$755.70
Profit over cost of feed	$594.43	$785.80
Average price of eggs	.34	.50
Cost to produce dozen eggs	.14.3	.24.5

SALMON-PACK OF PROVINCE, 1903 TO 1918, INCLUSIVE 93

FISHERIES COMMISSIONER'S REPORT FOR 1918.

Value of Canadian Fisheries and Standing of Provinces.

The value of the fishery products of Canada for the year ending December 31st, 1917, totalled $52,312,044, as against $39,208,378 for the preceding year, notwithstanding that the latter was considerably greater than in any preceding year.*

During the year 1917 British Columbia contributed fishery products of a total value of $21,518,595, or 41 per cent. of the total for the Dominion.

As in recent years, British Columbia again leads all the Provinces of Canada in the value of her fishery products. Her output for the year exceeded in value those of Nova Scotia by $7,050,276, and exceeded that of all the other Provinces combined by $11,156,941.

The following statement gives in their order of rank the value of the fishery products of the Provinces for the year ending December 31st, 1917:—

British Columbia	$21,518,595 00
Nova Scotia	14,468,319 00
New Brunswick	6,143,088 00
Quebec	3,414,378 00
Ontario	2,866,419 00
Prince Edward Island	1,786,310 00
Manitoba	1,543,288 00
Saskatchewan	320,238 00
Alberta	184,009 00
Yukon	67,400 00
Total	$52,312,044 00

The Species and Value of Fish caught in British Columbia.

The total value of each species of fish taken in British Columbia for year ending December 31st, 1917, is given in the following statement:—

Salmon	$16,828,783 00
Black cod	879,404 00
Hake and husk	1,090 00
Herring	1,192,654 00
Shad	675 00
Halibut	1,721,012 00
Soles	78,649 00
Flounders	23,601 00
Skate	10,117 00
Smelts	14,270 00
Oolachans	10,991 00
Brill	51,420 00
Octopus	1,656 00
Rock-cod	8,688 00
Pilchards	11,810 00
Whiting	2,725 00
Grayfish	4,480 00
Oysters	32,202 00
Clams and quahaugs	84,000 00
Dulse, crabs, and cockles	48,424 00
Trout	10,350 00
Sturgeon	9,790 00
Perch	4,920 00
Carried forward	$21,031,711 00

* The data used here is derived from the Dominion Bureau of Statistics, 1917.

THE SPECIES AND VALUE OF FISH CAUGHT IN BRITISH COLUMBIA—*Concluded.*

Brought forward	$21,031,711 00
Mixed fish	13,184 00
Salmon-roe	7,820 00
Fur-seal skins	6,540 00
Bone-meal	10,185 00
Fertilizer	70,164 00
Whale-oil	342,247 00
Fish-oil	23,892 00
Witches	50 00
Gill-bone	12,802 00
Total	$21,518,595 00

The total value for the year shows an increase over the previous year of $6,881,249; salmon products were increased by $6,285,178, due both to an increase in size of pack and its value. The halibut-catch was less, and, notwithstanding an increase in price, shows a decrease from the previous year of $305,658. The herring-catch is valued at $1,192,654, a slight gain over the previous year, and whale products show a gain of $94,220, with a total value of $446,486.

THE NUMBER OF PERSONS ENGAGED AND VALUE OF FISHERY PLANTS AND APPARATUS IN BRITISH COLUMBIA IN 1918.

The following statement gives the number and the value of the plants, vessels, boats, and apparatus used in the fisheries of the Province in 1918, and the number of persons engaged:—

	No.	Value.
Vessels, tugs, and carrying smacks	514	$ 2,500,801 00
Gasolene-boats	3,172	
Sail and row boats	3,548	1,837,820 00
Value of seines, trap and smelt nets	....	1,829,115 00
Value of hand-lines, weirs, trawls, etc.	....	119,381 00
Approximate value of salmon and other canneries, fish-houses, freezers, and fixtures	....	9,519,941 00
Total		$15,807,058 00

Number of Persons engaged in Fishery.

Number in vessels	1,589
Number in boats	11,378
Number in canneries, fish-houses, etc.	7,916
Total	20,883

THE SALMON-CATCH OF 1918.

The salmon-catch of the year 1918 exceeded all previous records and produced a pack of 1,616,157 cases. It exceeded the previous high record of 1917 by 581,672 cases. The catch of sockeye gave a pack of 276,459 cases, as against 330,209 cases in 1917; 107,354 cases of red and white springs packed, as against 76,276 cases in 1917; the pack of pink salmon totalled 527,745 cases, a gain over 1917 of 30,986 cases; and the pack of 497,615 cases of chum salmon exceeded that of the previous year by 21,342 cases.

THE 1918 SALMON-PACK BY DISTRICTS.

The Fraser River.—The total pack of all grades of salmon on the Fraser River run in British Columbia waters totalled but 210,851 cases, as against 402,538 cases in 1917, 127,472 in 1916, 320,519 in 1915, and 349,294 cases in 1914. Over 50 per cent. of the total pack consisted of chums and pinks. The catch of sockeye was less than 10 per cent. of the total, was much less than in any former year, and produced a pack of but 19,697 cases, as against 198,183 cases in the previous fourth year, 1914. Since 1914 was the brood-year of the greater proportion of this year's sockeye run, it shows that the run was less than 10 per cent. of that of its brood-year.

The season's pack of Fraser River seeking sockeye on Puget Sound totalled 50,723 cases, as against 357,374 cases four years ago. The pack of sockeye in the entire Fraser River District in 1918 totalled only 70,420 cases. Four years ago the combined catch of sockeye in that district produced a pack of 534,434 cases, or 86 per cent. more than this season. A more forceful demonstration of the depletion of the run of sockeye to that river could not be exacted. It warrants the statement that the Fraser is fished out of sockeye and the run is perilously near extinction. The conditions that have produced this result have been set forth in previous reports of the Department. As early as 1902 the Department gave warning that too many sockeye were being taken, and that, unless the fish were permitted to reach the spawning-grounds in far greater numbers, the run would be exterminated. Year after year that warning was repeated, and backed up by statements showing a steady decline in the number of sockeye that reached the spawning area. The warning fell upon ground as barren as the spawning area. The fishermen and the canners would not be denied. The amount and efficiency of the fishing-gear used to take the fish was increased without giving the sockeye any additional protection. The Canadian authorities indicated in no uncertain manner their willingness to meet the conditions by restricting fishing in their waters. The authorities of the State of Washington could not be induced to meet the situation by affording the fish that pass through their waters to reach the Fraser any adequate measure of protection. They disputed the facts submitted, and instead of restricting fishing they permitted an increase in the amount and character of gear used, thus adding to the efficiency of their methods. Even as late as the spring of 1918, at the American-Canadian Fisheries Conference, the State of Washington authorities contended that conditions on the Fraser were not of so serious a nature as to call for drastic treatment. At the Vancouver meeting of that Conference the Commissioner and his assistant both submitted written statements setting forth the views of the Provincial Government on this vital question. Those statements are reproduced in the Appendices of this report.

The Salmon-catch of Northern Waters.

The Skeena River.—The salmon-pack on the Skeena River in 1918 exceeded all previous records with a total of 374,216 cases, as against the previous record pack of 292,219 cases in 1917. There was a gain in all grades. Sockeye gave a pack of 123,322 cases, as against 65,760 in 1917, 60,293 cases in 1916, 116,533 in 1915, 136,166 in 1914, and 52,927 in 1913. Weather conditions throughout the sockeye season were most propitious. Fishing for spring and cohoe salmon was conducted at numerous outlying points by trollers, many of whom had excellent season's return.

Rivers Inlet.—The catch of salmon on the Rivers Inlet section shows a substantial gain over the two preceding years, with a total pack of 103,155 cases. The catch of sockeye gave a pack of 53,401 cases, as against 61,195 in 1917, 44,936 in 1916, 103,350 in 1915, 89,890 in 1914, and 61,745 in 1913. The pack of pinks exceeded all previous years, with a total of 29,542 cases, as against the two previous high records of 8,065 in 1917 and 5,784 in 1914. The run of pinks to Rivers Inlet has heretofore been very small. No theory as to the increase of this season has been advanced.

The Nass River.—The catch of salmon in the Nass River section is also a high-record one, totalling 143,908 cases, as against the previous high records of 119,495 in 1917 and 126,686 in 1916. The catch of sockeye again shows a decline, with a pack of 21,816 cases, as against 22,188 in 1917, 31,411 in 1916, 39,349 in 1915, and 31,327 cases in 1914. The record shows a steady decline in the run of sockeye notwithstanding the increase of gear used. The catch of pinks and chums shows substantial increase and is attributed to the more extensive use of traps and gear.

The Vancouver Island Section.

The pack of salmon taken from Vancouver Island waters, with the exception of the sockeye taken in the trap in the vicinity of Sooke, that are credited to the Fraser pack, totalled 389,815 cases. Operations were conducted at all points where any salmon could be taken. Large numbers of spring and cohoe salmon were taken in the open sea, facing the west coast, by means of trolling. Some 400 small boats were so engaged. The catch of sockeye was small. All other grades show an increase. Chums, with pack of 251,266 cases, exceed all others combined. The catch of pinks gave a pack of 57,035 cases and cohoe 40,732 cases. Some 5,500,000 lb. of salmon, mostly

chums, was exported in fresh state from the west coast. The catches made are regarded by the Department as an overdraft on the runs, and if continued will exterminate them.

The Catch at Nitinat Lake.

The catch of fall-running salmon at Nitinat Lake, on the southern shore of Vancouver Island, in both 1917 and 1918 were of such an extraordinary and excessive nature as to call for extended comment. Nitinat Lake is but fourteen miles in length by half a mile in width. It lies at sea-level and is connected with the sea by a narrow and short passage. There is but one tributary of importance, the river at the head of the lake, which has a length of some twenty miles. Except during heavy rains, its volume is not large. Its gravelled channel offers a limited extent of spawning area. It is the only tributary frequented by salmon. A few creek sockeye are said to enter it in the late spring. Chums in large number run to that stream in the fall. Commercial fishing was first undertaken there in 1917 by the Lummi Bay Packing Company, who built a cannery there that spring. By the use of two purse-seines the company's catch in 1917 produced a pack of 51,252 of chum salmon. Not being able to handle all the fish taken, they exported to their plants in the State of Washington some millions of pounds. Their pack in 1917 was the second largest put up at any one cannery in the Province. In 1918 the catch at Nitinat Lake produced a pack of 84,000 cases, 20,000 cases more than were packed at any other one cannery in the Province. The fishing-gear used by the company consisted of two purse-nets and a trap, driven at the mouth of the river at the head of the lake. In addition to the pack of 84,000 cases, some 5,000,000 lb. of salmon were exported from that district. No other water of anything like the proportions of Nitinat Lake has ever produced in two succeeding years anything like as many fish. No salmon run to any watershed of its size can stand such a drain without complete annihilation.

The drain on the salmon run to all Vancouver Island waters is in the judgment of the Department excessive, and calls for the immediate and serious attention of the fishery officials of the Dominion. The fish must be given far greater measures of protection than at present afforded them, or they will cease to be of commercial importance.

REPORTS FROM SALMON SPAWNING AREAS OF THE PROVINCE IN 1918.

During the season the Department, as usual, conducted an investigation of the salmon spawning areas of the Fraser River and Rivers and Smith Inlets. Detailed reports are attached hereto.

The spawning-grounds of the Fraser River basin were again inspected by John P. Babcock, Assistant to the Commissioner. He was assisted by Dr. C. H. Gilbert and Inspector of Fisheries C. P. Hickman. In the report made by Mr. Babcock it is again disclosed that the number of salmon which reached the spawning-beds was far less than in any previous year. In all the great lake sections of the Fraser above Hell's Gate Canyon there were few or no sockeye, and in the lower section, with the exception of the Lillooet Lake District, there were fewer sockeye than ever previously reported. As affecting future runs no importance need be attached to the few that did spawn in the upper section of the Fraser, and less importance than heretofore can be attached to those that spawned in the lower section. The total number of sockeye-eggs collected from the tributaries of the Fraser and placed in the hatcheries totalled 20,581,500, as against 22,484,000 four years ago. Twenty million sockeye-eggs were taken from Alaska waters by the United States Bureau of Fisheries and donated to the Dominion Government to assist in restocking the Fraser, and were shipped to the hatchery on Harrison Lake and are being incubated therein.

Rivers and Smith Inlets Spawning-grounds.—Fishery Overseer A. W. Stone reports that there was a serious shortage of sockeye salmon on the spawning-beds of Owikeno Lake, at the head of Rivers Inlet. He estimates that there was 25 per cent. less sockeye on the beds than in any one of the past six years.

Officer Stone, who also inspected the spawning-grounds of the Smith Inlet run of sockeye, reports that the number of fish observed there this year equalled the run of 1915, but that they were many times less than in 1914.

THE AMERICAN-CANADIAN FISHERIES COMMISSION OF 1918.

The American-Canadian Fisheries Commission appointed by the Governments of the United States and Canada to investigate fishery questions in waters contiguous to their boundary-lines

held meetings on this Coast, in Seattle, Vancouver, Prince Rupert, and Ketchikan in the spring of 1918. The Commission consisted of the Secretary of Commerce and Labour of the United States, the Hon. William C. Redfield, E. F. Sweet, Assistant to the Secretary of Commerce, and Dr. Hugh M. Smith, United States Commissioner of Fisheries, on behalf of the United States; and the Hon. Chief Justice J. D. Hazen, of New Brunswick, G. J. Desbarats, Deputy Minister of Naval Service, and Wm. A. Found, Superintendent of Fisheries, Ottawa, on behalf of the Canadian Government. The inquiry conducted on this Coast was confined to an investigation of the salmon-fisheries of the Fraser River and the American waters of Washington Sound and the halibut-fisheries of the Pacific.

At the Vancouver meeting of the International Commission, Commissioner Wm. Sloan and his Assistant, John P. Babcock, made extended statements as to conditions in the Fraser, which are reproduced in the Appendix of this report.

The Conference concluded its sittings in Ottawa in September and unanimously adopted a report. At the time of writing the report has not been made public.

Fishing by Indians in the Fraser River Basin above Tidal Limits.

The runs of salmon to the spawning-beds of the Fraser have become so alarmingly attenuated that drastic measures will have to be taken to restore the runs. The measures to be taken must not only include the secession of all fishing in tidal limits for a period of years, but must be made to include all fishing above tidal limits by Indians for all time, notwithstanding that they have both a natural and a treaty right to take such salmon as they desire for food so long as they confine themselves to the gear originally used by them.

The Indians resident in the Fraser River basin have always fished for salmon. Before the advent of the white men they depended almost wholly upon salmon for their winter food. They take them as near their homes as possible and cure them by smoking. An approximate estimate of the number of sockeye salmon taken by Indians above the commercial fishing limits on the Fraser River in the years of the big runs previous to 1913 place the number at 200,000. It probably largely exceeded that number. The number taken in former years of the big run by the Indians resident in the Chilcotin River section is placed at from 40,000 to 50,000. Those taken by Indians from the Fraser basin above the mouth of the Chilcotin is given at 20,000, and between the mouth of the Chilcotin and Bridge Rivers at 40,000-odd, while those along the banks of the Thompson and Shuswap and Adams Lakes at 30,000, in the canyon of the Fraser at Yale at 15,000, and in the Harrison-Lillooet Lakes section at 40,000. The figures here given include only sockeye that were taken, dressed, and cured. They do not include the other species of salmon taken or the sockeye consumed in a fresh state. The catches made by Indians in the years of the big runs previous to 1913 were not a serious drain on the run of those years. The numbers taken during the lean years, though considerably less than in the big years, was a serious drain on the spawning-beds. During the last decade none of the tribes above the canyon at Yale have been able to get any considerable number in any lean year, and their catches in both 1913 and 1917 did not exceed those of early lean years. The drain on the runs was nevertheless serious.

The right of the Indians to take salmon is unquestioned, but the number of salmon they can now catch is so small as to be of little benefit to them. Owing to the fact that most of the Indians now grow the bulk of the food they use and are no longer dependent upon salmon, and that drastic measures must be taken to restore the runs of salmon to the Fraser, the Government should step in and acquire by purchase the Indians' right to take fish above the commercial boundaries. It is suggested that the Indians, if deliberately approached, would dispose of their fishing rights to the Government, and that the Government is fully warranted in entering upon negotiations to acquire those rights. The sooner the better.

It is self-evident that salmon taken from the vicinity of their spawning-grounds are much more valuable individually and collectively than the fish taken within commercial fishing waters. Sockeye that were worth 75 cents each to commercial fishermen on the Fraser the past year are worth many times that amount on the spawning-grounds. The runs of the future depend upon the number of eggs deposited and hatched within the river's basin. The female sockeye of the Fraser produce averagely 2,500 eggs each.

It has been suggested that the Indians be deprived of their right to fish above commercial fishing boundaries, and in lieu thereof be aided to do all their fishing within commercial limits.

Possibly the Indians in the delta of the Fraser and those resident south and west of Yale might operate to advantage and fairly economically. The suggestion is wholly impracticable so far as the great majority of the Indians are concerned. Very few of the Indians from the Chilcotin or north of Bridge River have ever engaged in fishing within commercial waters. For them to journey, with women, who do all of the work of dressing and smoking the fish, from their homes to tidal waters and then back again with their bales of dried fish would cost the Government many times more than to purchase and transport a far greater supply of other foods for the use of the Indians at home.

The Indians of the Fraser are reasonable beings. There are many clear-headed men in their councils. If this matter be taken up with them in a deliberate, clear, and painstaking manner, it is advanced that they would soon see the benefits to be derived by disposing of their fishing rights. Their right at the present time is of little value to the most of them and is steadily lessening in value. Many of them realize this to be true. The Government should act in this matter without further delay; the expense to be covered from the collection made for fishing licences.

Migration of Adult Sockeye Salmon in Puget Sound and Fraser River.

During the American-Canadian Fisheries Conference on the Pacific Coast in April and May, 1918, questions were raised as to the time taken by sockeye salmon to pass from the waters of Juan de Fuca Strait through Puget Sound and the Gulf of Georgia to the Fraser River. In order to settle this important economic question, experiments were made by the Fishery Departments of Canada and the United States Governments in marking with metal tags adult sockeye taken from fish-traps in the waters named. The results of this experiment are covered in a report just issued by the Bureau of Fisheries, Washington, D.C., which is reproduced in the Appendix of this report from advance sheets furnished the Department by Dr. Hugh M. Smith, United States Commissioner of Fisheries. The report is of interest, though it cannot be said that the results of the experiment have by any means determined the questions at issue. The questions involved are vital in determining measures of conservation, and must be conducted for a sufficient period of years to produce conclusions of value.

Contribution to the Life-history of the Sockeye Salmon.

Dr. Gilbert's fifth contribution to the reports of the Department on the life-history of the sockeye salmon, which is issued herewith, includes an analysis of the sockeye runs of 1918 to the Fraser, Skeena, and Nass Rivers and Rivers Inlet, and throws much additional light on the mooted question of the return of mature spawning salmon to the particular part of a river's basin in which they had been hatched and reared. The present paper is of great value since it conclusively demonstrates that, in the Fraser at least, the sockeye does return to spawn in the identical tributary in which it was hatched. In dealing with this important economic question Dr. Gilbert considers a number of propositions. If there was, he submits, no tendency for a salmon to return to any definite spawning district, the sockeye entering so extensive a basin as the Fraser would be as likely to spawn above as below the canyon at Yale. Every spawning-bed in that event would contain individuals which had been hatched and reared in widely different portions of the basin, and the output of one centrally located hatchery would furnish stock for all sections, since each spawning area would draw indifferently on the common stock of returning migrants and the salmon frequenting it would necessarily agree in their structural characteristics with those frequenting each of the other spawning areas throughout the basin. There would be no basis for differences. Those spawning in different parts of the basin would agree in their average size as yearlings and as adults. They would agree in the relative number of four- and five-year-old fish, in the relative numbers of those which had spent one year or two years in fresh water after hatching, or had proceeded to sea as soon as they were free-swimming. All the groups and all the variations of character which are found in the main runs off the mouth of the river would be repeated in every spawning section. Such would inevitably be the case if the salmon passed indifferently to the various spawning areas, without reference to that of their native habitat.

On the other hand, he submits that if differences are found to exist in the populations of distinct spawning districts it must be considered direct evidence that segregation has occurred, and is based on some principle which has determined that certain individuals in the common

run shall pass to one spawning area while others go elsewhere to spawn. The only principle adequate to explain such segregation, if it generally occurs, would be the return of fish to spawn in their native tributary.

Dr. Gilbert abundantly demonstrates that the latter principle obtains, as between different river-basins, even when they are very limited in size and have their outlets to the sea in close proximity to each other. In their passage to these minor streams along the salt-water channels the schools of sockeye are often intimately mingled, and they separate only as the river-mouths are approached. Off Namu, on Fitzhugh Sound, gill-nets operated along the shore capture in about equal numbers at the same time sockeye which are bound for Bella Coola and those which are bound for Kimsquit. They have been distinguished by characteristic scale-markings. They run together along the same channels. Where they separate has not been demonstrated, but by the time Bella Coola and Kimsquit Rivers are reached complete separation has occurred. Dr. Gilbert points out that this case does not seemingly differ greatly with that of fish bound for different tributaries of the same river. Conceivably, the schools may be separated as their respective tributaries are reached. If the populations of these tributaries show distinguishing characteristics, no other satisfactory explanation presents itself. It must be considered, he states, also, that a partial segregation of spawners may occur, though not a total one. That within certain limits indifference exists as to the precise spawning-ground frequented. Thus the up-river fish may predominately run early and proceed above the canyon in the Fraser, passing without selection into any stream that becomes available; while the late-running fish may enter the Harrison, the Pitt, and Cultus Lakes again without determinate destination. That this supposition is without validity for the lower river becomes evident from the fact, emphasized in last year's report, that the fish entering Pitt Lake are so widely different from those entering Cultus Lake, and even the different spawning-beds of the Harrison, can usually be shown to possess individual characteristics of unquestioned significance.

With regard to the river above the canyon the case is not so clear, partly due, no doubt, to lack of adequate material. No material at all adequate has been obtained from any up-river tributary except the Chilcotin, because of late years the runs to the upper river have become extremely attenuated. Efforts of the last two years failed to produce the desired evidence, and it may now be too late to secure it owing to permanent depletion.

Where spawning populations show distinguishing characteristics, the inference is clear and unavoidable. A physiological barrier has existed for so long a period that minor differentiations have developed and a strain or sub-race has been formed. But what is to be concluded in cases where the colonies of two distinct spawning areas present no characteristics by which we can distinguish them? Obviously, Dr. Gilbert states, we must infer either (*a*) that segregation in their case has not occurred, or (*b*) that it has occurred but has not been effective in producing divergence between the colonies. If the first of these were true, it would signify that the "home-stream" instinct was in most cases rigidly operative, while in one or more instances within the same river-basin it was wholly in abeyance. The second supposition would seem *a priori* far less improbable. Complete segregation of spawning fish may occur, and each individual return to the stream in which it was hatched and reared, and yet, in certain instances, separate colonies may have failed to develop distinct methods of growth by which they can be distinguished. A failure to discover distinguishing characteristics between populations of separate spawning areas need not indicate that their progeny will fail to return at maturity to its native stream. The two colonies may have been wholly distinct and self-perpetuating for a very long period and yet no differences have been developed. If we should adopt distinctive marks for the young from each of the two streams on their downward migration to the sea, it might be shown at maturity that each stream contained spawners with a single mark only, the one that had been given to the young from that stream. Yet the adults from the two streams might be otherwise indistinguishable. Negative evidence in such a case proves nothing. But if affirmative evidence is found, it is conclusive. If differences are found to exist, there is no alternative to the acceptance of the "home-stream" theory. Reviewing the evidence collected in the Fraser basin in 1918, Dr. Gilbert says:—

"In general, it can be stated that the examination of this material completely supported and verified the conclusions reached in 1916 with regard to the spawning-beds below the canyon; *we affirm without qualification that they are as distinctively populated as though located in separate streams independently entering the sea.* Additional material only emphasizes the fact.

Not only were the different colonies in 1918 marked by distinctive characters, but these characters were the same for each colony as those noted in 1916."

Dr. Gilbert shows that a very conspicuous instance of racial differentiation is furnished by the Harrison watershed. It is not known how many distinct spawning areas may have existed there. Several minor colonies, like that known to have existed at Silver Creek, are now practically exterminated, and there are doubtless distinct areas in Lillooet and Tenas Lakes, but no records have been obtained. A very limited number of late spawners still frequent the slack waters of the main river above Harrison Rapids, the vanishing remnant of a once fine run visits the lake at the head of Morris Creek, and a considerable run still goes up the Birkenhead River; both of these runs pass over the spawning-beds at the Harrison Rapids, but not one of them tarries there. An examination of 200 spawners taken from the rapids in 1918 by Mr. Robertson, the clever Superintendent of the hatchery on Harrison Lake, failed to yield a single fish which had been spawned elsewhere. Not one of the 200 could be confused with those constituting either the Morris Creek or the Birkenhead colony, and not one of the fish taken on the rapids was found among the 400 specimens taken at Morris Creek, and over 200 from the Skookumchuck and the Birkenhead. No Morris Creek strays were found in the Birkenhead and no Birkenhead fish were found in Morris Creek, in spite of the fact that the Birkenhead fish had all passed close to the mouth of Morris Creek on their way up. In these cases the law of segregation is most strictly in force, yet it seems impossible to imagine a locality better suited to straying of the spawning fish with resulting mixture of populations. That it does not occur here gives confidence that the same law rules everywhere, though the evidence of it may be less compelling.

The most interesting colony of the Harrison, Dr. Gilbert shows, is the one which spawns late in the season at Harrison Rapids. The nature of that spawning area is in itself highly unusual. The spawning habits of the sockeye have been shown to be rigidly fixed. Unlike other species, they must resort to a lake, and fail to frequent streams save during their migrations. They spawn in lake tributaries or on the gravel shores of lakes. Their young develop in the waters of lakes and commonly reside there over a year before migrating to the sea. Of the few which descend from lakes to the sea, few ordinarily survive to return at maturity. But the Harrison Rapids spawners use gravel-bars in the main river and there is no lake between them and the sea. Their young, in consequence, have no lake to drop down to. They have, Dr. Gilbert shows, adopted the highly exceptional method of life for a sockeye, of migrating to sea as soon as they are free-swimming and before their scales have begun to grow. No data is obtainable as to the percentage of survival, but enough have survived to keep the colony flourishing. This is apparently not true of the sockeye of any other spawning area of the Fraser. It demonstrates, however, that under the spur of necessity a sockeye colony can adapt itself to the habit of sea migration in the early free-swimming fry stage, a rare habit in sockeye, though a characteristic of pink and chum salmon and frequently of the spring. The 200 specimens of Harrison Rapids spawners taken and examined in 1918 had all gone to sea in the fry stage. Not one of them exhibited in the centre of its scale any trace of growth in fresh water. The scales from all others taken from different spawning areas recorded growth in fresh water of a year or more. In 1918, as in 1916, Dr. Gilbert failed to find any individuals of sea-type spawning in any part of the Fraser basin other than the Harrison Rapids, though upwards of a thousand specimens from other sections were examined. The fact that no sockeye of sea-type was discovered elsewhere in the basin, when coupled with the further fact that every Harrison Rapids sockeye belonged to the sea-type, furnishes the strongest possible evidence of the return of spawning sockeye to their native districts.

Dr. Gilbert's paper is reproduced in the Appendix of this report, together with reproductions of microscopic photographs of the centres of thirty-four scales of sockeye salmon taken from many sections of the Fraser River basin, the markings of which demonstrate that in the Fraser the sockeye returns to spawn in the identical tributary in which it was hatched.

HALIBUT.

The landing of halibut at our ports and those of Seattle and Tacoma for the year 1918 shows a decrease of 14,375,000 lb. from that of 1917. Vancouver landing for 1918 totalled but 1,902,000 lb. as against 5,162,000 lb. in 1917. Prince Rupert shows a decrease of 3,801,000 lb., with total landings of 14,777,000 lb. Such statements demonstrate the alarming decrease of this fishery and afford additional evidence of the value of the publications of this Department in

1915 and 1916 on the condition affecting the fishery, and which furnished evidence to show that the banks had been seriously depleted, and that early action on the part of Canada and the United States must be taken if the fishery was not to be destroyed. Up to this time no action has been taken by either Government. Joint action alone can be effective. This subject was considered by the American-Canadian Conference and evidence taken. The conclusions reached have not been made public. The remarkable and alarming decline in the catch of 1918 is most impressive and demands early action upon the part of Canada and the United States. The correctness of W. F. Thompson's conclusions, furnished and published by this Department in 1915 and 1916, can no longer be questioned. Unless the halibut is given immediate and radical measure of protection, they will be exterminated on this Coast as they have been on the Atlantic. International action must be taken. By no other means can the halibut banks be given the necessary protection.

WHALING.

Whaling during 1918 was most successful. Three stations were operated on our Coast. The following statement, furnished the Department by the Consolidated Whaling Company, of Victoria, gives the number and species of whales landed at each of their stations during 1918:—

Statement showing Number and Species of Whales landed at British Columbia Stations in 1918.

Station.	Sperm.	Sulphur.	Fin.	Sei.	Hump.	Right.	Bottle-nose.	Total.
Kyuquot	12	4	88	101	41	..	..	246
Rose Harbour	17	12	69	15	25	1	1	140
Naden	5	15	51	14	29	..	..	114
Totals	34	31	208	130	95	1	1	500

CANNED WHALE-MEAT.

A total of 29,585 cases of whale-meat was canned at the company's station of Kyuquot in 1918. The pack was made in round 1-lb. flat tins similar in all respects to salmon, each case containing forty-eight tins. The Commissioner's Assistant made a careful inspection of canning operations, and in his report said: "The canning plant at the Kyuquot whaling-station, where the meat of the whale is canned, is up to date in every respect. I followed the process through every detail. Every feature of it, from the cooling of the meat to the sealing of the can, is in every respect all the most fastidious could wish. I sampled the contents of many cans taken from the pile of those canned previous to my visit. The contents, to my taste, equalled the best canned beef or mutton in the market. There can be no question but that canned whale-meat will command a market." A rapid expansion in output is anticipated.

PILCHARDS.

The run of pilchards to the estuaries of the west coast of Vancouver Island was greater than previously reported. Heretofore they have not been noted on the west coast in waters south of Barkley Sound. This year they were taken in numbers by the salmon-traps in Juan de Fuca Strait and in nets in Esquimalt Harbour, Cadboro Bay and Haro Strait as far north as Mayne Island. The fish were large and fat. Many were sold fresh and several salmon-canners packed them in 1-lb. and ½-lb. cans, and they met with ready sale.

DEEP-SEA TRAWLING.

The distinguishing feature of the fishery year was the successful operating of deep-sea trawling vessels from our ports. Experiments conducted in 1917 out of Prince Rupert demonstrated that there were "banks" adjacent to that port where trawling could be conducted, and which resulted in the successful operations of 1918. The trawler "James Carruthers" made forty-nine trips out of Prince Rupert between February 28th and December 19th, occupying 151 days, which resulted in the landing of some 2,000,000 lb. of fish consisting of flounders, sole, witch, brill, cod, skate, and a limited amount of halibut. The average trip of the trawler from dock to dock was three days. On being dressed the fish were placed in cold storage and frozen, and marketed principally in the North-west, under provisions of Order No. 18 of the Canada Food Board, being

retailed from 10 to 11 cents per pound; the Dominion Fisheries Department assuming two-thirds of transport charges. The trawlers' operations were limited because of the lack of a market. The catch was in excess of the demand. There is no longer a question as to lack of supply or suitable trawling "banks." Given a market an abundant supply is assured.

The bulk of the catch was, as stated, marketed in the North-west. Heretofore that section has been supplied only from the Coast with salmon and halibut. Other salt-water fishes were unknown. The sale of Pacific flatfish and cods was stimulated by an active publicity campaign conducted by the Canada Food Board. Sales in 1918 were sufficiently large to warrant the belief that a permanent market can be established, provided the price of that year can be maintained. There is no question as to the food values of trawl-caught fish. They are the equal of any food-fishes, with the exception of salmon. They have more flavour than halibut, and can be sold at less than half the price of either salmon or halibut. Evidence of the value in which they are estimated is demonstrated by the fact that the landing of trawl-caught fish at the chief ports of Great Britain, notwithstanding the war, between May 4th and September 14th, 1918, totalled 1,658,764,000 lb. During the last four months of 1917 an average of 1,500,000 lb. per month of trawl-caught fish were landed in San Francisco.

In face of the declining catch of our estuary and halibut fisheries, it is encouraging to record the success of deep-sea trawling from our ports. A success so great as to warrant the belief that eventually a large fleet of trawlers will operate from our ports.

The Department give considerable attention to the operation of the trawlers. Curtailed as operations were by a limited market and cold-storage capacity, they were extensive enough, as stated, to warrant exploitation. In advancing measures for the engagement of returned overseas service men, the Commissioner stated:—

"In formulating measures for the engagement of returned overseas men, full consideration should be given to the fisheries. Deep-sea trawling conducted out of British Columbia ports in 1917 and 1918 were profitable and afford evidence of the wealth of food-fishes that await exploitation. What is required at this time to reap the wealth is more suitable vessels and more trained men to operate them. This want can be supplied on the Pacific Coast by the establishment of a trawling-school—a school for the training of men to engage in deep-sea trawling-fishing—by providing a number of suitable vessels equipped for deep-sea fishing and officered by experienced navigators, engineers, and fishermen to act as instructors, and to which returned overseas men could be apprenticed for instruction in navigation; the assembling and operation of steam and gas engines; the construction, care, casting, and hauling of trawl-nets; and the dressing, storing, packing, and shipment of the fish caught.

"In consequence, it is suggested that the Government provide a number of suitably equipped vessels, man them with capable instructors, and engage them in training returned overseas men in deep-sea trawling-fishing. The men during their apprenticeship to be paid a good living wage and given a bonus from the ship's earnings, after capital expenditures have been paid, that would eventually give the apprentices, who by that time are experienced men, the ownership of the vessel.

"Well managed, the operations of such vessels would be sufficiently profitable to furnish the means for operation and maintenance and create a sinking fund that would reimburse the Government and permit the vessel being transferred to the men to be worked on their own. There is room for at least ten such training-ships on the Pacific Coast of Canada, each of which could provide tuition for twenty-five apprentices. Such a school as is here suggested could be directed and operated in connection with the Naval Training School now established at Esquimalt.

"In addition to the practical trawling sea school here suggested, there should be established at Prince Rupert and Vancouver fish curing and packing schools for the practical training of overseas men in the curing, packing, and marketing of fish, and through which the catches of the training-trawlers could market their catch.

"Men graduated from the land school could be sent in to the North-west and established as wholesale and retail handlers of both frozen and cured fish, first as the agents of the schools, and so bonused as to eventually acquire their plant and the business they have been enabled to establish.

"The establishing and maintenance of such schools as are here suggested will not provide for the engagement of a large number of returned men, but it does provide for a number and will materially assist in building up a food-providing class of hardy men in a field where men are needed and where they may gainfully engage."

THE OTTESEN METHOD OF FREEZING FISH.

A. Ottesen, an exporter of fish of Thistal, Denmark, after years of experience, has invented a system of freezing fresh fish that has widely been adopted in Europe, and which should prove of value to companies operating in the Province which are not equipped with cold-storage plants.

The Fishery Director of Norway described the Ottesen method as revolutionizing the fish-refrigerator. The Inspector-General of France says: "After being thawed in water for five or six hours the fish frozen by the Ottesen method look like fresh fish and are in the same condition. The freezing does not cause the slightest injury to the flesh tissues, but, on the contrary, after the fish have been prepared for the table they keep their firmness and full flavour. Fish so frozen have been shipped long distances without change in texture or flavour."

The principle of the Ottesen method is simple and easily understood. The fish are not frozen in the ordinary way in air, but in a strong solution of common salt in water, which is cooled to very low temperature and in which the fish are immersed. The freezing-point of the solution of salt depends upon the degree of saltness; the more salt, the lower the temperature. A solution with 3 per cent. of salt freezes the fish at about 27° Fahr. A solution with 17 to 20 per cent. of salt may be cooled down to from 10° to 60° Fahr. without freezing the solution. It is a solution of this kind which is used (instead of cooled air) to remove the heat from the fish and to freeze it. The apparatus consists essentially of an insulated iron vat or container of suitable dimensions in which the salt solution is placed. The cooling of the solution is accomplished by means of a central spiral, or worm, of iron tubing in connection with an ammonia refrigerating-machine, and the solution is kept in constant movement by a central revolving propeller. Large fish are hung in the solution, the smaller being placed in baskets of wire netting.

The great value of the method appears in the simplicity of the apparatus, its cost, and in the rapid freezing of the fish. Herring in baskets are completely frozen in half an hour and the largest cod in from two to three hours. In ordinary methods of freezing in air the time taken would be from twenty-four to thirty hours. An ordinary Ottesen apparatus can freeze 10 tons of fish in twenty-four hours.

The A. Ottesen fish-freezing process was patented in Canada several years ago and the Canadian rights sold to the Det Danske Frysnings Kompagin, address 33 Ny Toldbodgade, Copenhagen.

THE SOCKEYE SALMON-PACK* OF THE FRASER RIVER DISTRICT FROM 1900 TO 1918, INCLUSIVE.

Year.	Fraser River.	Puget Sound.	Totals.
1900	229,800	228,704	458,504
1901	928,669	1,105,096	2,033,765
1902	293,477	339,556	633,033
1903	204,809	167,211	372,020
1904	72,688	123,419	196,107
1905	837,489	847,122	1,684,611

1910	37,343,000
1911	22,937,000
1912	38,500,000
1913	86,000,000
1914	28,589,000
1915	68,476,000
1916	40,203,000
1917	31,004,000
1918	20,581,500*

* In addition to the collections made from Fraser River, 20,000,000 sockeye-eggs taken in Alaska were hatched at Harrison Lake.

APPENDICES.

THE SPAWNING-BEDS OF THE FRASER RIVER.

Hon. Wm. Sloan,
Commissioner of Fisheries, Victoria, B.C.

Sir,—I have the honour to submit that during the season just closed I made a thorough inspection of the salmon fishing and spawning grounds of the Fraser River. The catch of all species of salmon from the Fraser River District within the Province produced a pack of only 201,851 cases, of which more than half consisted of pinks and chums. The total pack of all grades four years ago totalled 349,294 cases, 198,183 of which were sockeyes.

The Catch of Sockeye.

The catch of sockeye in Provincial waters of the Fraser River District this year was very much the smallest ever made. It produced a pack of only 19,697 cases, as against 148,164 cases in 1917, 32,146 in 1916, 91,130 in 1915, and 198,183 in the preceding fourth year, 1914. The catch in our waters of the district was but 10 per cent. of that made in the latter year, the brood-year of the greater proportion of this year's run.

The catch of sockeye this season in the State of Washington waters, included in the term Fraser River District, was but 14 per cent. of that made in those waters four years ago. The combined catch of sockeye in that entire district this season was the smallest ever recorded, and was 87 per cent. less than the catch in the preceding fourth year.

Since the primary test of the size of a run of sockeye to the Fraser River District is the catch, and is expressed in figures by the pack, the above statements display the serious extent of the depletion in that run to that district, and fully justified the statement made by you last summer at the Vancouver meeting of the Canadian-American Fisheries Conference, "that the run of sockeye salmon to the Fraser River is perilously near to extermination."

The Department's report of four years ago, in dealing with the conditions of the spawning-beds of the Fraser, stated that the beds contained less sockeye than I had previously observed there. It is therefore not surprising now to learn that the run this year was so limited.

Condition on the Spawning-beds of the Fraser.

During the season I personally inspected the principal sockeye-spawning area of the Fraser River basin, and was assisted by Dr. C. H. Gilbert and Inspector of Fisheries C. P. Hickman. The inspection made this year, like the sixteen former inspections made by me since 1901, was conducted during the spawning period. As a result of the last inspection, I have to submit the opinion that far less sockeye reached the spawning-beds this year than in any previous one of which there is a record. In all of the great lake sections of the Fraser above Hell's Gate Canyon there were few or no sockeye, and in the lower section of the Fraser, with the exception of Lillooet Lake, there were less sockeye than previously reported.

The number of sockeye that reached Hell's Gate, in the narrow canyon of the Fraser above the village of Yale, was smaller than in any former year. The Indians who fished there, under daily supervision of Dominion fishery officials, caught less than 1,500 sockeye. They could have taken more, and would have done so, but for the fact that the run of spring salmon was above the average and satisfied their own demands, and they were not permitted to sell either fresh or salted fish to the whites.

The Indians who fished at the canyon in the Fraser above the mouth of Bridge River caught less than 400 sockeye, and those engaged on the Fraser at Chimney Creek and at Soda Creek took less than 100 at each location, while those fishing just below the mouth of Quesnel River were unable to catch any sockeye at all. No sockeye were reported from that section of the basin above the mouth of Quesnel River.

The conditions at Quesnel and Chilko Lakes are best evidenced by the statements that less than fifty sockeye are recorded by the Provincial watchman as having entered Quesnel Lake, and that it took Dr. Gilbert and myself, operating separately at the principal Indian fishing-places on the Chilcotin River, a week to obtain scales and measurements from 100 individual sockeye. Throughout the season the Chilcotin Indians at all their fishing-places caught less than 500 sockeye. Dr. Gilbert was desirous of obtaining scales and measurements of sockeye entering the Chilcotin and Quesnel Rivers. As stated, it took a week to get the data from the Chilcotin, and we could get no data from the Quesnel because so few reached that river, and they came so scatteringly that none were caught.

Not to exceed 100 sockeye are known to have entered Seton-Anderson or Adams Lakes, though the creeks leading from them were under observation throughout the season, and less than 100 sockeye were found in any of the many tributaries of Shuswap Lake.

Indians resident along and near the Thompson River again had no fishing-platforms on the banks of that river, and are not believed to have taken fifty sockeye or any pink salmon this year. No pink salmon were reported in the Fraser above Hell's Gate.

In former reports on the spawning area of the Fraser I have dealt separately and at length with conditions at all the principal districts in the upper section of the basin. I do not do so this year because the whole story is told in the above statements. There were too few fish in those waters this season to warrant further records. No future importance need be attached to the few that did spawn there.

The number of sockeye which reached the spawning area of the lower section of the Fraser basin this year were less than four years ago, and the hatcheries collected less sockeye-eggs. The run to the streams at the head of Lillooet Lake was less than four years ago. The hatchery maintained there collected 12,000,000 sockeye-eggs, as against 15,000,000 four years ago. The run was, however, greater than last year. In addition to the fish that reached the hatchery this season, it is to be noted that the Dominion Fishery and Indian Officer Grant, who was stationed at the portage between Harrison and Lillooet Lakes, records that the Indians fishing at that portage took over 6,000 sockeye. As in recent years, by orders of Officer Grant, the Indians retained only the male fish caught by them. The females taken were returned uninjured to the water, and were thus enabled to reach the streams at the head of lake.

The number of sockeye that entered Harrison and the lower lakes was less than four years ago, and less eggs were collected for the hatcheries.

The total number of sockeye-eggs collected for the hatcheries on the Fraser from its tributaries was 12,210,000 less than four years ago.

Chief Inspector of Fisheries Lieut.-Colonel F. H. Cunningham reports that some 20,000,000 sockeye-eggs taken from streams in Alaska were donated and shipped to the Harrison Lake Hatchery by the United States Bureau of Fisheries, and that they will hatch them and the young be liberated in the vicinity of Harrison Lake. This addition to the hatcheries gives a total of 32,210,000 sockeye being incubated for liberation in the Fraser, as against 22,484,000 in 1914.

JOHN PEASE BABCOCK,

Victoria, B.C., December 1st, 1918. *Assistant to the Commissioner.*

THE SPAWNING-BEDS OF RIVERS INLET.

Hon. Wm. Sloan,
Commissioner of Fisheries, Victoria, B.C.

Sir,—I have the honour to submit the following report in respect to the conditions existing on the spawning-beds at Rivers Inlet for the year 1918:—

Leaving the cannery at Rivers Inlet on October 7th, I proceeded to the lake with the intention of going right through to the headwaters, a distance of between thirty-eight and forty miles, but the weather, which had permitted the inspection of the spawning-beds of Smith Inlet to be made under such favourable conditions, suddenly changed, and created such a sea on Lake Owikeno by the high wind that it was considered advisable to remain near the mouth until an improvement was shown.

Eventually reaching Jeneesee Creek, a distance of twenty-two miles, I inspected the spawning-beds situated at this point. The creek, which in 1913 and 1914 was literally swarmed with sockeye salmon, and commented upon very favourably in my reports for those two years, was practically empty; beyond one or two small schools swimming about in the creek and a few noted breaking water outside on the gravel shores of the beach, there was nothing to indicate an exceptional run to this tributary. The hatchery officials, who usually obtain their eggs from this stream, had been unsuccessful in securing any so far. Since the experience of the past two or three years has shown that the fish have arrived late, it was deemed desirable to again visit this section on my return from the headwaters of the lake, in case I was too early. The logs and jams which litter the stream all the way up to the falls form a formidable barrier to the number of sockeye which eventually reach these beds. I do not remember, in the six years of my experience of this particular stream, noting so many small grilse as on this occasion. Schools of them were observed spawning on the gravel-bars right up to the falls, having managed to wriggle their way through the fence erected by the Dominion Hatchery. The small number of sockeye salmon which had arrived at the creek were of good average size and compared favourably with the 1914 run.

The Machmell River, another tributary flowing directly into the lake at this point, although one of the largest of the streams to be met with in this watershed, does not, nevertheless, appear to be favoured by the sockeye salmon. Owing to the high stage of the water at this time the inspection was conducted under extreme difficulty. The thick muddy condition of this glacier stream did not favour accurate observation of the likely numbers spawning on the beds, but indications higher up, where the river-bed was visible, did not point to a big run; very few fish were seen. The swift-running river precluded all attempts to secure a collection of eggs or scales for the Department.

It was hoped that the run of sockeye salmon up the Nookins River, a tributary to the Machmell, would make up for the indifferent number seen at the latter point, but an examination of this stream disclosed similar conditions. It was difficult to believe that these spawning-beds which in former years have been so plentifully seeded could be depleted to the extent shown this year, especially as the spawning-beds were full of sockeye salmon in 1913 and 1914. There were no log-jams or other obstructions (with the exception of the log-jam two miles from the mouth, which does not, however, cause an obstruction to the fish) to account for the failure of the salmon to run.

On arriving at the head of the lake next day, I made camp and inspected the tributaries at this section. The Indian River, which was examined under the most favourable circumstances, was absolutely empty; not one sockeye was visible as we made our way through the rapids to the falls. There were no log-jams or other obstructions to account for the failure; therefore it cannot be due to this cause. The Cheo River, one of the finest spawning-grounds for the salmon, and upon which the early-running sockeye deposit their ova, again showed up very unsatisfactorily in comparison with the large numbers noted on the occasion of my visit there in 1913 and 1914. Very few fish were spawning on the beds as we made our way up to the falls, four miles and a half distant, and only an occasional glimpse of them could be obtained in the deeper portions of the river. No collection of eggs was made possible owing to the agile salmon eluding every effort to spear them.

The log-jam at the bend three miles up had not materially changed since my visit last year. It affords no real obstruction unless the falls are opened to permit the salmon reaching the spawning-beds above. If, as has been suggested, a fish-ladder is built through the falls, then it will become necessary to blast out the jam to provide passage to the onward movement of the fish.

In making the examination of the Washwash River last year, I drew attention to the huge jam that obstructed the mouth and prevented the salmon reaching the extended spawning-beds above. I am glad to report this year that a portion of the obstruction had been washed away by an extreme freshet and permitted the salmon to reach these beds. The log-jam, however, is a source of danger and may at any time effectually block this river.

Proceeding to the falls two miles and a half distant, I noted the comparatively small number of sockeye spawning on the beds, the majority having spawned out, but I was able to obtain a collection of both salmon and scales from this stream.

The unsatisfactory state of the spawning-beds of the three rivers suggested that the unavoidable delay in reaching them may have been the cause for the poor results shown, but Indians who had been camping here for the past six weeks stated that even at the height of the run of sockeye, three weeks prior to my visit, very few had come into the rivers in comparison with former years, and that it was only with extreme difficulty sufficient numbers were obtained to supply their winter's need. It is evident, therefore, that the outlook does not favour a big run to this section of the lake four or five years hence. In size the run of sockeye salmon came well up to the average.

Returning from the head, I inspected Sunday Creek, a small mountain stream flowing into the lake. In my report for last year I drew attention to the change in the course of the channel; the original one had been obliterated. I found again another change where an extreme freshet had burst its way through, changing the course again and obliterating the channel formed last year. It is to be feared, therefore, no reliance can be placed upon this stream to successfully fulfil its functions year by year. In the Narrows, where formerly large numbers of both sockeye and cohoe salmon were seen on the beds, was found to be lacking of both species on this occasion.

The Sheemahant, the largest and most productive river of the lake, and which in past years (with the exception of 1916) had received its full complement of both sockeye and cohoe salmon, failed this year to sustain its reputation; it fell far short of the prolific numbers encountered here in 1913 and 1914. A few sockeye were observed spawning on the riffles as we proceeded up to the falls, but owing to the high stage of the water it was difficult to gauge with any degree of accuracy the real number actually on the spawning-beds; there was no room left for doubt, however, that the run this year has dropped to approximately 25 per cent. of the 1913 and 1914 runs. The few sockeye salmon observed were all fine specimens of the race and came well up to the average. No log-jams obstruct this fine river, which is open to the salmon up to the falls eighteen miles distant.

In making the return visit to Jeneesee Creek, I was quite prepared to see a big change in the number of sockeye salmon spawning on the beds, but in this I was disappointed; very few had arrived. The hatcherymen had obtained one or two boxes of eggs, but from the small number of fish seen in the creek it did not look very hopeful for the requisite number necessary to fill the hatchery being produced. In comparison with the 1913 and 1914, the run of sockeye to Jeneesee is a failure.

I found great difficulty in accurately estimating the run of sockeye salmon to the Asklum River owing to the tremendous volume of water flowing down at the time of my visit; it was necessary to go right up to the falls, and then work our way down the sides of the river, before an opportunity was afforded to view the spawning-beds with any degree of accuracy. A fair number were observed spawning on the riffles, and should provide for a fair run returning here four or five years hence. In examining several of these fish I found they were not yet ready for spawning, and indicated their early arrival from the lake. They were fine specimens of the sockeye race, and here again came well up to the average of the other rivers. In estimating the run I have to record a decrease to approximately 50 per cent. of the 1913, 1914, and 1915 runs.

Quap River, in comparison with former years, is a complete failure. Calling in there on my way up the lake, I noted a few sockeye spawning on the beds below the fence and a small number had reached the pen; concluding that this was only a forerunner of a big run which has never failed so far to eventually make its appearance, I was certainly surprised to find on my return

that little improvement had been shown. The hatchery officials had met with little success in their endeavour to fill the hatchery and had barely obtained 1,000,000 eggs.

As the capacity of the hatchery is about 14,000,000 eggs, it is obvious that unless a big run entered very soon their efforts would be doomed to disappointment. Such a situation has occurred, so I am given to understand from information courteously supplied by the hatchery officials; only about 3,000,000 eggs were secured by them.

The conditions above the fence have not changed in any way; huge trees and log-jams which obstruct the river right up to the falls are still in evidence, and will entail heavy expense in removing to permit the salmon reaching the extended spawning-beds.

The Dalley River, situated directly opposite Quay, showed little improvement. Indians who had been up here three or four times during the last five weeks confirmed the lack of sockeye salmon seen on the occasion of my visit there, and reported that they did not remember having seen so few fish spawning on the beds. This has in former years been regarded as one of the most productive streams of the lake. In 1913, and especially in 1914, the sockeye salmon were seen in dense masses. It is to be feared that this river is also a failure. No log-jams interfere with the progress of the salmon up-stream.

The hatchery creek appeared to be well stocked with sockeye salmon, the fine spawning-beds showing to great advantage; the bars outside were thickly covered with spawning fish and in size attained a high average.

The facilities for erecting a fence to obtain eggs for the hatchery are by no means favourable owing to the raging torrent of water which comes down after a heavy rain; consequently the large numbers of spawning sockeye cannot be utilized by the hatchery for artificial propagation, the experience of past years precluding the erection of a fence.

All along the shores at the mouth of the lake the sockeye salmon were observed in very large numbers; also the fine spawning-beds lying around and close to the Indian rancherie were thickly covered, and for the first time showed up in favourable contrast to the poor run of sockeye salmon to the other tributaries of Lake Owikeno.

Spring salmon were breaking water all the way down through the rapids of the Owikeno River and compared very favourably with former years.

I noticed the cohoe salmon repeatedly breaking water as we proceeded back from the lake; one or two had been caught in the pen at Quap River and indicated by their appearance early arrival from salt water. I have no doubt that later on the spawning-beds will receive their full complement of this species of salmon.

In reviewing the results of the inspection of the Rivers Inlet watershed, I am of the opinion the serious shortage of sockeye salmon disclosed by a visit to these beds, and amounting to approximately 25 per cent. of the 1913, 1914, and 1915 runs, will have a correspondingly serious effect on the number of adult sockeye which will return from this season's spawning.

It may be recorded here that an exceptional run of humpback salmon invaded the inlet during the sockeye-fishing season and permitted some of the canneries to put up large packs. The same peculiar conditions were experienced in other sections of the district, notably at Bella Coola and Kimsquit, where abnormal numbers were caught by the fishermen, who made big money in consequence, some of them making between $3,000 and $4,000.

In conclusion, I wish to express my indebtedness to G. C. Johnston (manager) and J. Dawson, of Rivers Inlet Cannery; Captain Hamer (Superintendent) and J. Reid (Foreman); and the men at the various spawning camps.

I have, etc.,

Arthur W. Stone,

Fisheries Overseer.

Rivers Inlet, B.C., November 10th, 1918.

THE SPAWNING-BEDS OF SMITH INLET.

Hon. Wm. Sloan,
Commissioner of Fisheries, Victoria, B.C.

SIR,—In obedience to instructions from the Department to inspect the spawning-grounds of Smith and Rivers Inlets respectively for the year 1918, I have the honour to submit the following reports:—

Proceeding to Smith Inlet to undertake the inspection of this watershed first, I arrived there on September 22nd, and after making arrangements with Indians started for Long Lake the following day.

Bearing in mind the extraordinary number of sockeye salmon seen on the spawning-beds at this point in 1914, it was certainly surprising that the run this year did not come up to expectation, and that the two canneries operating here were only able to put up a total pack of about 14,000 cases of sockeye salmon between them. Comparing this with the total pack of about 28,000 cases put up by the Smith Inlet Cannery in 1914, it will be seen there must be some explanation for the decrease shown. I am of the opinion, after closely reviewing the spawning-beds, that the poor results are due to the following reasons: A decided decrease in the number of sockeye salmon reaching the spawning-beds following a comparatively poor run of fish up the inlet. In comparison with the exceptionally big run which invaded the inlet in 1914, and correspondingly large numbers reaching the beds in that year, it was a distinct disappointment—i.e., if the four-year fish were the predominating factor in that year—to find the beds had not received their complement of spawning fish. Another reason may be given in the extra number of gill-net fishermen empowered to fish this inlet in comparison with former years; their nets, which were distributed over the inlet in large numbers, disorganized the schools of salmon proceeding up the inlet, and instead of schooling up at the seining-grounds went right through and on to the lake. I am given to understand from the seine-net fishermen that only one fairly big haul was made by them during the whole of the run.

The inspection of the spawning-grounds was made under very favourable conditions, fine weather prevailing all the time, and the rivers which last year precluded accurate observations, due to exceptionally bad weather, were low and permitted me to observe them without interruption.

The Docee River (the overflow to the lake) was well stocked with spring salmon; a very large number were seen in the clear-running water making their way up; also the fine gravel spawning-beds at the mouth of the lake contained large numbers. I am able to record a substantial increase in the number of spring salmon in comparison with former years.

At no previous inspection have I noted so many cohoe salmon as on this occasion; schools were observed swimming around and intermingled with the springs, which from their healthy-looking state proclaimed their early arrival from salt water. Indications pointed to the spawning-beds receiving their full quota of eggs from this species of salmon.

The run of sockeye salmon to Quay Creek, a small stream situated about seven miles from the mouth of the lake, although inspected under the most favourable conditions, showed a falling-off, and presented a great contrast to the numbers seen here in 1914. Schools of these fish were swimming around outside in the shallow waters of the lake, which no doubt will be the means of plentifully seeding the beds later on.

No exceptional brood, however, may be expected from the adults which will eventually return to this stream from this season's spawning. The run may be compared to the number reaching this stream in 1915.

Proceeding to the head of the lake, we made camp at the mouth of the Geluch River. In making our way through the rapids to the falls later, it was satisfactory to note that the reputation of this fine spawning stream, although not bearing fruit to the same extent as in 1914 and 1915, nevertheless received its full quota of spawning sockeye, which I estimate came within 25 per cent. of the number seen on these beds in the years previously mentioned; they were fine healthy-looking specimens of the race and compared in size to the 1914 run.

Each riffle appeared to be thickly covered until we reached the spawning-beds just below the falls, where the few sockeye observed in this portion of the river presented a vivid contrast to the dense masses which lined the beds in 1914.

No log-jams or other obstructions impeded the progress of the salmon up-stream. A few small grilse were observed in this river for the first time in my inspection of these beds.

I was very disappointed with the run of sockeye salmon to the Delabah River. In 1914, it will be recalled, large numbers were observed both in the river and in the shallow waters of the lake outside; great stress was laid upon the unsuitability of these beds for the propagation of salmon spawn, and suggested the benefit a hatchery would provide to counteract the all too apparent wastage which was manifest in that year. The relatively small run of sockeye which reached the beds bears a great significance in relation to the warning given at that time.

In making my way up to the falls fair numbers were noted spawning, but did not by any means reach the high standard attained in 1914; the beds should be fairly well seeded, however. In size the sockeye were fine specimens of the race and compared very favourably with the 1914 run.

Stretching from one end of the bay to the other, the fine gravel spawning-beds of the lake presented a very empty appearance in comparison to the milling mass of sockeye noted here in 1914; beyond one large school which was seen waiting at the mouth of the river, there was no indication that the remarkable run would be repeated this year.

In making a comparison, I estimate the run closely resembles that of 1915, or only about 25 per cent. of the total run to this section in 1914. No log-jams or other obstructions interfere with the free movement of the salmon in this river.

Returning to the mouth of the lake, the cohoe salmon were observed breaking water frequently, but none so far had reached the spawning-beds. A late run of these fish appear to have entered Smith Inlet only after the canneries had ceased operating, with the result that some fishermen who had made big hauls were unable to market their fish. One or two canneries from Rivers Inlet, however, came to their assistance later.

The run of humpback salmon was very satisfactory and permitted the canneries to put up an average pack.

In summarizing the results of the inspection at this watershed, I am of the opinion that the adult sockeyes which will return from this season's spawning will by no means approach the vast numbers seen on the beds in 1914, but should result in a run equal to that of 1915.

In regard to the run of cohoes, humpbacks, and spring salmon, I have reason to believe that the favourable impression formed this year will result in a good run from each of this species of fish on their return as adults.

In conclusion, I wish to express my indebtedness to G. F. Harris, Manager of the Wallace Fisheries at Smith Inlet.

I have, etc.,

Arthur W. Stone,

Fisheries Overseer.

Rivers Inlet, B.C., November 10th, 1918.

CONTRIBUTIONS TO THE LIFE-HISTORY OF THE SOCKEYE SALMON. (No. 5.)

By Charles H. Gilbert, Ph.D., Professor of Zoology, Stanford University.

I. SPAWNING SOCKEYE COLONIES IN THE TRIBUTARIES OF THE FRASER RIVER DURING THE SEASON OF 1918.

In our report for the season of 1916 we presented for the first time evidence derived from an investigation of the salmon which frequented separate spawning areas of the Fraser River. Those which were found spawning in Morris Creek were examined separately from those that spawned at the Harrison Rapids. And in like manner independent studies were made of the spawners at the Harrison Hatchery, in the Birkenhead River at Pemberton, in Pitt Lake, in Cultus Lake, and in the Chilcotin River. The object of the investigation was to throw light on the much-mooted question as to the return of the mature spawning salmon to that particular part of the river-basin in which they had been hatched and reared. In the answer to this question a number of possibilities must be considered.

(1.) There may conceivably be no tendency for a salmon to return to any definite spawning district, or to any geographically distinct group of spawning districts. In such case any sockeye entering the Fraser would be as likely to spawn above as below the canyon, and as likely to spawn in any one tributary as in any other. Every spawning-bed in that event would contain individuals which had been hatched and reared in widely different portions of the basin.

Each spawning area would draw indifferently on the common stock of migrants, and the salmon frequenting it would necessarily agree in their characteristics with those frequenting each of the other spawning areas throughout the basin. There would be no basis for differences of any description. The salmon spawning in different parts of the basin would agree in their average size, as adults, and in their early history as fingerlings migrating seawards. They would agree in the relative numbers of four- and five-year fish, in the relative numbers of those which had spent one year or two years in fresh water after hatching, or had proceeded to sea as soon as they were free-swimming. All the groups and all the variations of characters which we find in the main run examined off the mouth of the river would be repeated in approximately equal proportions on every spawning-ground. Such would inevitably be the case if the salmon passed indifferently to the various spawning areas without reference to their native habitat.

On the other hand, if differences are found to exist in the populations of distinct spawning districts, this must be considered direct evidence that segregation has occurred, based on some principle which has determined that certain individuals in the common run pass to one spawning area while other individuals go elsewhere to spawn. The only principle adequate to explain such segregation, if it generally occurs, would be the return of fish to spawn in their native tributaries.

This principle obtains, as we have abundantly demonstrated, as between different river-basins, even when these are of very limited size and have their outlets to the sea in close proximity to each other. In their passage to these minor streams along the salt-water channels the schools of fish are often very intimately mingled, and they separate only as the river-mouths are approached. Thus, in the vicinity of Namu, on Fitzhugh Sound, gill-nets operated along shore capture in about equal numbers at the same time sockeyes which are bound for Bella Coola and those which are bound for Kimsquit. These can be distinguished by characteristic scale-markings. The two schools are running intimately mingled along the same channels. Where they separate has not been determined. The greater part of them may pass up Burke Channel together, or it may be the Kimsquit fish may take the Dean Channel. But by the time Bella Coola and Kimsquit are reached complete separation has occurred.

The case would seem not greatly different from that of fish bound for different tributaries of the same river. Conceivably, the schools may be mingled along the main channels of the river and become separated as their respective tributaries are reached. If the populations of these tributaries show distinguishing characteristics, no other satisfactory explanation presents itself.

(2.) We must consider also the possibility that a partial segregation of spawners occurs, but not a total one; that within certain limits indifference exists as to the precise spawning-ground frequented. Thus the up-river fish may predominately run early and proceed above the canyon, passing without selection into any stream that becomes available; while the late-running fish may enter the Harrison, the Pitt, and Cultus Lakes again without determinate destination. That this supposition is without validity for the lower river becomes evident from the fact previously emphasized that the fish entering Pitt Lake are so widely different from those entering Cultus Lake, and that even the different spawning-beds of the Harrison can usually be shown to possess individual characteristics of unquestioned significance.

With regard to the river above the canyon, the case is not so clear, partly, no doubt, from lack of adequate material. The runs of the upper river have of late years become extremely attenuated. No material at all adequate has been obtained from any up-river tributary except the Chilcotin, and because of permanent depletion we may now find it too late to secure any. A small run which makes it possible for natives to secure a few fish for food from the main channels of the up-river may yet disappear for all practical purposes when it becomes widely distributed among the tributaries. And unless material can be so secured after final segregation has occurred it is useless for our purposes. The differences which distinguish fish spawning in contiguous areas are usually of such small amount and compass that they become wholly masked when two or more races are mingled.

This may be the case even at the mouths of the main tributaries. More than one spawning district, each with its special characteristics, may be found within a given tributary. The Harrison River, for example, has at least four spawning areas. Scales and other data collected solely at the mouth of the Harrison, or in its lower course, would be valueless. The different strains would be mingled and their characteristics obliterated. The nearer the material is obtained to the final spawning-grounds, the greater its value for investigations of racial divergence.

(3.) Where spawning populations show distinguishing characteristics the inference is clear and unavoidable. A physiological barrier has existed—the racial habit of return at maturity to spawn in the native stream—for so long a period that minor differentiations have developed and a strain or sub-race has been formed. But what are we to conclude in cases where the colonies of two distinct spawning areas present no characteristics by which we can distinguish them? Obviously, we must infer either (*a*) that segregation in their case has not occurred, or (*b*) that it has occurred but has not been effective in producing divergence between the colonies. If the first of these were true, it would signify that the "home-stream" instinct was in most cases rigidly operative, while in one or more instances within the same river-basin it was wholly in abeyance.

The second supposition would seem *a priori* far less improbable. Complete segregation of spawning fish may occur, so that each individual returns to the stream in which it was hatched and reared, and yet, in certain instances, separate colonies may have failed to develop distinct methods of growth or of habit by which they can be distinguished. Failure to discover distinguishing characteristics between populations of separate spawning areas need not indicate then that their progeny will fail to return at maturity each to its native stream.

This process may have been in operation for many thousand years. The two colonies may have been wholly distinct and self-perpetuating for a very long period and yet no differences have developed. If we should adopt distinctive marks for the young from each of the two streams on their downward migration to the sea, it might be shown at maturity that each stream contained spawners with a single mark only, the one that had been applied to the young from that stream. Yet the adults from the two tributaries might be otherwise indistinguishable. Negative evidence in this case proves nothing. But if affirmative evidence is found, it is conclusive. If, in fact, differences are found to exist, there is no alternative to our acceptance of the home-stream theory.

Different tributaries of the same river may be quite unlike in the sharpness of the characteristics by which their colonies may be recognized. Cultus Lake, a tributary of the Lower Fraser, possesses a strongly marked race of small salmon, pale in colour of flesh, poor in oil, scarce

worthy of the name of sockeye; while Pitt Lake, also tributary of the Lower Fraser, is frequented by a large race the opposite in all respects of the Cultus Lake colony. But we have been unable to distinguish the fish of Morris Creek, tributary to the Harrison River, from those spawning in the lake-gravels in front of the Harrison Hatchery and in the small stream that supplies it. In this latter case we have obtained no direct evidence of segregation; but it is rendered highly probable by the more numerous instances in which it can elsewhere be demonstrated.

The most important investigation during the season of 1918 consisted in an attempt to test the conclusions which we had based on the material of 1916 by a re-examination of the colonies frequenting the same spawning-grounds previously reported on. It was hoped to secure, also, material from additional spawning-grounds above the canyon, from which nothing heretofore had been obtained.

The season of 1918 was peculiarly ill-suited to the purpose. In the recent history of the Fraser we have grown accustomed to noting that each successive year is the worst in the history of the industry, or is in any case distinctly worse than its representative in the last cycle, four years previously. But the extent of the disaster in 1918 was unexpected and overwhelming. A run of sockeyes to the Fraser can hardly be said to have occurred. Under such circumstances the numbers that escaped to the spawning-grounds were most limited. Along the main river-channels were a few locations, like the canyon above Yale, the Bridge River fishing-grounds above Lillooet, and those above the mouth of the Chilcotin at the Chimney Creek Bridge and at Soda Creek, where natives by persistent dipping secured a few fish. Material was obtained at all these points, but for reasons already stated it was of less value for the purposes of the present investigation. In all these river-channels it was apparent a number of local races were mingled. Because of this the range of variation in all the characters examined was excessive, far greater than when we have before us data obtained from a single spawning area.

In addition to these main-river locations, we were successful in securing a limited amount of material from the Chilcotin River at Hanceville and at Fish Canyon near its mouth; from the Birkenhead at Pemberton; from the Skookumchuck above Harrison Lake; from the Harrison Hatchery, Morris Creek, and the Harrison Rapids; and from Pitt Lake. For much of this material we have to thank the very generous co-operation of Alex. Robertson, Superintendent of the Harrison Lake Hatchery, and T. W. Graham, Superintendent of the Pemberton Hatchery on the Birkenhead. To both of these gentlemen we extend our grateful acknowledgments.

In general, it can be stated that the examination of this material completely supported and verified the conclusions reached in 1916. With regard to the spawning-beds below the canyon, we affirm without qualification that they are as distinctively populated as though they were located in separate streams independently entering the sea. Additional material only emphasizes this fact. Not only were the different colonies in 1918 marked by distinctive characters, but these characters were the same for each colony as those noted in 1916. We have then the picture of a number of self-perpetuating sub-races, each of which has acquired certain minor habits of growth, of migration, of age at maturity, of length of life in fresh water, of colour and quality of flesh—the same characters, in short, which in various combinations characterize the races of the separate river-basins of the simpler sort.

A very conspicuous instance of racial differentiation is furnished by the Harrison watershed. We do not know how many distinct spawning areas it may have contained. Several minor colonies, like that frequenting Silver Creek, are now practically exterminated. There were spawning areas doubtless in Lillooet and in Tenas Lakes, but no records of these have reached us. A very limited number of late spawners still frequent the slack water of the main river above Harrison Rapids, the vanishing remnant of a once fine run visits the lake at the head of Morris Creek, and a considerable run still goes up the Birkenhead. Both the Birkenhead and the Morris Creek fish pass over the very spawning-beds at Harrison Rapids, but not one of them tarries there. An examination of 200 specimens, laboriously gathered at Harrison Rapids in 1918 by Mr. Robertson, failed to yield a single fish which had been spawned elsewhere than in the beds of the rapids. Not one could on even a cursory examination be confused with those constituting either the Morris Creek or the Birkenhead colony. Not one of the Harrison Rapids fish was found among over 400 specimens examined from Morris Creek, and over 200 from

Skookumchuck and the Birkenhead. No Morris Creek strays were found in the Birkenhead, and no Birkenhead fish were found in Morris Creek, in spite of the fact that all the Birkenhead fish passed the mouth of Morris Creek on their way. In these cases, evidently, the law of segregation is most strictly in force; yet it seems impossible to imagine a locality better suited to straying of the spawning fish with resulting mixture of populations. That it does not occur here, where fish pass over and pass by one another's spawning-grounds, gives confidence that the same law rules everywhere, though the evidence of it may be less compelling.

Harrison Rapids.—The most interesting colony of the Harrison is the one which spawns late in the season at Harrison Rapids. The characteristics of this colony were fully discussed in our report for 1916, page 50. The nature of the spawning area is in itself highly unusual. The spawning habits of sockeyes are generally regarded as rigidly fixed, more so than with any other species of salmon. Unlike other species, they must resort to a lake, and fail to frequent any stream, otherwise suitable, which has no lake which they can succeed in entering. The lake once attained, they spawn in the gravel-beds around its margin or ascend some affluent of the lake in search of suitable spawning-beds. The young develop mainly, if not exclusively, in the waters of the lake, frequenting the depths in the daytime, but rising to feed at the surface in the evening. Under such conditions the sockeye commonly resides over a year in the lake, sometimes over two years, occasionally over three years, before seeking salt water. Of the varying number which precociously descend to salt water in their first spring, few ordinarily survive and return at maturity.

But the Harrison Rapids spawners use gravel-bars in a shallow backwater region of the river, where they have no genuine lake conditions at their disposal, nor any lake into which the young can drop back after hatching. They have adopted, therefore, the highly exceptional method of life for a sockeye, of dropping down to salt water as soon as they are free-swimming, and while we have no data as to their mortality or the percentage of survival, it is clear that before man disturbed the balance of nature, enough survived to keep the colony in a flourishing condition. More than this cannot be said for any of the other colonies. Clearly, then, under the spur of necessity, a sockeye colony can adapt itself to the habits of sea migration in the early free-swimming fry stage, a habit rare in sockeyes, and so far as known never occurring among cohoes; but almost exclusively characteristic of humpbacks and dog-salmon, and frequent among chinooks.

The 200 specimens of Harrison Rapids spawners examined in 1918 had all had the history above outlined. Not one of them exhibited in the centre of its scale any trace of growth of the young in fresh water. All had passed down to sea as young fry before any portion of the scales had made their appearance.

It is very difficult to place satisfactorily on record the evidence for racial differentiation as observed on the spawning-beds. As previously pointed out, the scales have suffered extensive erosion during the later weeks which precede the spawning. Not only are the margins of the scales broken down and absorbed to such an extent that they no longer serve for determination of age, but the surface of the remaining portion of the scales has become more or less defaced. Absorption has taken place not only at the margins but also on the surfaces of the scales, and the lines of growth are blurred or obliterated. Enough may be preserved to render possible a detailed examination under the microscope, where the course of the ridges can be traced from such fragments as remain, by the aid of focusing at different levels. But such scales produce very unsatisfactory photographs. Nevertheless, it has seemed advisable to have a number of these from each of several spawning areas of the Fraser reproduced as a permanent record. Only the centres of the scales are figured, the worn and jagged edges being omitted.

Figs. 1 to 5 are from the spawning race at Harrison Rapids. Each contains the extensive first year's growth which occurs wholly in salt water, together with a varying portion of the second year's growth. The boundary between the two years in these cases is not a sharp one, leading to the conclusion that fry which descend to the sea in their first year suffer less interruption to their growth during their first fall and winter in the sea than is the case with those which pass their first year or their first two years in fresh water. Rarely, however, a slackening of growth in the Harrison Rapids fish at the close of their first year is indicated by a definite line of demarcation at its outer edge. When this exists there are thirty-two to forty rings or lines of growth belonging to the first year.

As was observed in 1916 and during previous years, sockeyes belonging to the type which alone frequents the Harrison Rapids spawning-beds—the sea-type—make their appearance during the latter part of the run only, at the mouth of the river and in the approaches to it. In 1916 the first to appear were taken on July 17th, and after that date they occurred constantly to the close of the season.

In 1918 the first to make their appearance at Esquimalt, from traps along the Vancouver Island shore, were found on July 14th. Not a single specimen had been found among the 250 which had been previously examined, distributed over June 17th, 20th, and 28th, July 2nd and 10th. They were present on July 14th, 18th, 21st, 25th, 29th, August 2nd, 4th, 8th, 11th, and 26th. The only dates on which examinations were made at Esquimalt after July 14th that yielded no individuals of sea-type were August 13th, 16th, and 23rd. The numbers of this type were evidently decreasing during the very last of the run.

The defective condition of the scales made it impossible to determine directly the age of the Harrison Rapids fish, but the lengths were secured, and a valuable clue can be obtained from the range in size found in three-year fish and in four-year fish of this type before they enter the river. The complete range may not be available because of the small number of individuals of sea-type which were obtained at Esquimalt during 1918. Only twenty-four in all were observed. Five were three-year males; one a three-year female; five were four-year males; thirteen were four-year females. The three-year males ranged from 20½ to 24 inches long; the four-year males from 26 to 28 inches. Comparing these figures with the Harrison Rapids column in Table I., it is seen that the majority of the Harrison Rapids males are from 25 to 29 inches long, and that the lengths of these, when tabulated, form a fairly regular curve, with the mode at 27. Lying below 25 inches, extending from 17½ to 24½, are sixteen thinly scattered records, which form no part of the curve referred to. As these two elements in the table agree closely with the observed lengths of three- and of four-year males obtained in salt water where age can be determined, we are justified in concluding that approximately all Harrison Rapids males between 17½ and 24½ inches long are in their third year, while those between 25 and 29 inches long are in their fourth year.

The single three-year female of this type secured from salt water in 1918 is 20½ inches long, while thirteen four-year females range from 24 to 26½ inches. Table II. gives the length distribution of Harrison Rapids females, all but three of which fall within the scope from 23 to 26 inches and form again a regular curve, while three individuals are 20, 22, and 22½ inches long respectively. It is highly probable that the three last mentioned are in their third year, while the remainder are in their fourth year. The earlier dates, on which sea-type individuals appeared in the run, produced only three-year males and four-year females, the other groups appearing subsequently.

In 1918, as in 1916, we failed to find any individuals of sea-type spawning in any part of the Fraser River basin other than Harrison Rapids. Upwards of a thousand specimens were examined from other spawning districts, in which it might be thought an occasional sea-type individual might be found, if only as a stray. The fact that not one individual was discovered elsewhere, when coupled with the further fact that every Harrison Rapids sockeye belonged to this group, furnishes the strongest possible evidence of the return of spawning fish to their native districts.

Morris Creek.—This stream offered in the early days one of the most valuable spawning districts in the Harrison watershed. In his report for 1902, pages 24 and 25, J. P. Babcock states: "Morris Creek and Lake are insignificant bodies of water, but as a spawning-ground for the late run of sockeye, and from the standpoint of artificial propagation, they constitute one of the most important and valuable points on the Fraser. The Dominion Government has operated a spawning-station here since 1885, and with the exception of the year 1900 has never failed to take eggs. All the salmon-eggs taken by the Dominion in this Province up to 1901 were secured at this station." Much later than 1901 Morris Creek still served as the principal source of eggs, first for the Bon Accord Hatchery near New Westminster, and later for the Harrison Lake Hatchery. None of the fry in the early days were returned to Morris Creek, as it was not believed that such procedure was necessary to maintain the spawning run. Even

in 1902 (*l.c.*) Mr. Babcock wrote: "It is generally believed that fish bred in a given watershed, such as the Fraser, return to it upon reaching maturity, and there is considerable evidence to warrant it. It has not, however, been settled, and probably never will be, that the fish bred in a given tributary of a large river seek only that tributary to spawn." Believing, then, that any increase in the run to a large river would equally benefit all the tributaries, there seemed no reason for laboriously returning fry to Morris Lake in order that they should return there and help maintain the spawning run. Knowing, as we now do, that salmon will in general return to the district in which they are liberated, the fate of the Morris Creek run seems to have been inevitable. It has steadily dwindled with the years until it can no longer be depended on for any considerable take of eggs. Natural propagation was reduced to a minimum in order to obtain eggs for the hatcheries, while the hatchery-reared fry did not at maturity return to Morris Creek. The same has been the history of Silver Creek, where "the Dominion Government placed a weir in August, 1902, and took nearly two and a half million eggs, which were transferred to the hatchery near New Westminster." The run in Silver Creek is now practically extinct, and we cannot doubt that this process has been hastened by failure to replenish its run through the planting of fry. No better examples than these can be found of the necessity of working out completely the entire life-history of our commercial fishes before it is possible to propagate them with success or to legislate wisely for their protection. Failure to follow this principle has discredited hatchery-work from the beginning, and has led to the well-founded suspicion that in many instances they have been more of a detriment than an advantage to the runs.

Morris Creek would seem to have been an ideal hatching and rearing ground for the sockeye. The enormous run entering this very insignificant stream in early days furnishes evidence of extraordinarily favourable conditions. Examination of the scales of the fish now running shows a striking uniformity in their development. They form an impressively homogeneous lot. All have large sharply defined nuclear regions, testifying to a vigorous growth during their first year, which is uniformly passed in the lake. The number of nuclear rings varies from fifteen to twenty-eight, with the mode at twenty. The frequency curve is given in Table III. In all probability the fingerlings on migrating from the lake in the spring of their second year were 4 to 6 inches in length, and better fitted to cope with their enemies than the smaller weaker yearlings from less favourable localities.

Figs. 6 to 8 give typical centres of Morris Creek scales. No individuals from this district had lived two years in the lake before migrating, and none had proceeded to sea in their first year. The length distribution, given in Tables I. and II. in the columns for Morris Creek, seems to indicate that the majority of the fish were in their fifth year. The modal length for the males at 27 inches and for the females at 25 or 26 inches closely agrees with that usually characteristic of five-year Fraser River fish.

Birkenhead River.—This affluent of the Harrison has now the most reliable sockeye run, and is the only spawning district of value remaining in this watershed. Its present importance is due in part doubtless to the fact that it was not drawn on for hatchery purposes until a much later date than Morris Creek and the Harrison Lake region, and in perhaps larger part to the significant fact that the output of the hatchery is constantly planted in the Birkenhead and helps maintain the run.

The characteristics of the Birkenhead race in 1918 are in general the same as those described for the 1916 run. The growth of the fingerlings in fresh water must be much less than in the case of the Morris Creek and Harrison Lake fingerlings. The nuclear area of the scale averages small, with densely crowded rings. These were somewhat more numerous in 1918 than in either of the two years preceding and the extremes range far more widely. The lot in 1918 was far less homogeneous than in 1916 and 1917, even those taken at the Pemberton Hatchery presenting an unexpected amount of variation. While the nuclear regions average small and the number of rings in the great majority of individuals is less than sixteen (the mode lying somewhere between eight and eleven), occasional specimens have nuclear rings running as high as nineteen, twenty, and twenty-one. Furthermore, the frequency curve for nuclear rings in 1918 has none of the regularity so well defined in 1916 and 1917. The irregularities in 1918 are equally marked and

are similar, whether the specimens were procured at Skookumchuck or at the Pemberton Hatchery on the Birkenhead. As seen in Table III., there is at both localities a mode at eight rings, one at eleven, and a less regularly defined one at fifteen. Yet, so far as known, all come from the same spawning-grounds. It is not clear what significance, if indeed any, attaches to this circumstance. In spite of the variation in nuclear rings, racial peculiarities are apparent. Especially marked is the small size of the first year's growth in the sea, a character that was also conspicuous in the two years preceding. Occasionally this is carried so far that the first year's growth in the sea resembles a second year in a lake, but only one undoubted two-years-in-lake individual was observed.

It was found possible to determine age from the scales in a larger percentage of individuals than was possible in other spawning localities. Both at Skookumchuck in the Lillooet River and at Pemberton on the Birkenhead between 40 and 50 per cent. of all specimens could be grouped by age. This does not, however, give a reliable estimate of the relative numbers of four- and of five-year fish present. With imperfect scales, the age of five-year fish is more readily determined than of four-year fish. Four-year scales cannot be determined unless some portion of the original margin of the scale is preserved, thus demonstrating that a fifth year's growth had not been present when the scale was intact. But five-year scales are unmistakably such in cases where not only the margin but the entire fifth summer's growth has been lost. If the last winter's band of crowded rings is present beyond the growth of the fourth summer, or any part of such band, the fish was evidently in its fifth year. The practical absence of six-year fish of the one-year-in-lake type in the Fraser River facilitates this determination.

In 108 specimens from Skookumchuck, the age was ascertained in fifty-four, or exactly one-half. Thirty-four of these were in their fourth year (twelve males and twenty-two females) and twenty were in their fifth year (twelve males and eight females). In 180 specimens from the Birkenhead, age could be determined in seventy-eight, or 43 per cent. Of these, forty-one were in their fourth year (three males and thirty-eight females) and thirty-seven in their fifth year (twenty-one males and sixteen females). If these proportions were reliable, we should have 37 per cent. of five-year fish at Skookumchuck and 47 per cent. at Pemberton, the percentage for both localities being 43. As stated above, this percentage is too high. The minimum percentage of five-year fish can be obtained by assuming that all the undetermined individuals were four-year fish, which reduces the proportion to 19 per cent. Obviously, this extreme assumption cannot be justified. If one-fifth of the undetermined individuals were five-year fish, there would be slightly over 30 per cent. of five-year fish in the Birkenhead-Lillooet section, and this must be considered a fairly satisfactory estimate. The percentage of five-year fish of the one-year-in-lake type in the total run, as determined by samples taken frequently throughout the season at Esquimalt, was 23, and these ran largely in the early part of the season. The percentage during June and the first half of July was higher than that indicated.

Pitt Lake.—Over 200 specimens were examined from Pitt Lake, and of these only twenty-five could have their age determined. These proved to be in their fifth year in every instance except one, the latter having spent two years in the lake as a fingerling and having returned from the sea in its sixth year. Reference to Table I. indicates that the sizes of the Pitt Lake spawners were similar to those from Morris Creek and Birkenhead, the majority ranging from 25½ to 29½ inches, with an average of 27.7 in the males, and from 23 to 27, with average at 25.4 in the females. These averages are in the case of the males much higher than for five-year males taken from the main run in salt water (26.3); while the average for females agrees exactly with that obtained from five-year females taken in the Vancouver Island traps. It is our belief that practically all of the Pitt Lake run was made up of fish in their fifth year.

The lot proved most homogeneous. The nuclear regions represented a fresh-water growth obviously under highly favourable conditions, though as fingerlings they had failed to attain as large a size as did the fingerlings in Morris Creek. The nuclear rings are bold, firm, well spaced, closely parallel, and regular. The number of rings, as seen in Table II., ranges from thirteen to twenty-one, with mode at seventeen, much lower than Morris Creek. One individual has as few as ten rings; another as many as twenty-three. It is a well-marked race. Figs. 22, 23, and 24 illustrate the nuclear regions of characteristic scales from this region. Like the Morris Creek race, the first year's growth in the sea is large and vigorous.

The Chilcotin River.—It was with difficulty that any material was obtained from this district. Mr. Babcock and the writer spent August 21st to 23rd at Hanceville and Alexis Creek. One specimen only was seen at Alexis Creek, while at Hanceville, although dipping was constantly in progress, only eighteen individuals were taken. At Fish Canyon, near the mouth of the Chilcotin, on August 24th and 25th, thirty freshly caught sockeyes were examined, and portions of the skin containing scales were dissected off from sixty-two fish found drying on the racks. In the case of the dried specimens we could obtain no reliable measurements and no record of sex. But the history of the individuals is, of course, found equally recorded on the scales. Such material, in default of better, may be availed of for the present purpose.

A cursory examination of the Chilcotin material would be sufficient to demonstrate that it is totally distinct from any of the spawning runs investigated in the part of the Fraser River basin which lies below the canyon. No single specimen from the Chilcotin agrees with the Harrison Rapids colony in having migrated to salt water in its first year. All had spent at least one year in the fresh-water lakes before descending to the sea. Furthermore, a considerable proportion of the Chilcotin fish (from 35 to 40 per cent. of the whole) had spent two full years as fingerlings in their lake. This is a very significant fact, in view of the almost total absence of representatives of this group from the Harrison watershed and the Pitt during the season of 1918. Obviously there is wide variation from year to year in the extent to which fingerlings in the same spawning area will tarry in the lake for a second year. Thus, as has been shown in our report for 1916 (page 51), the two-years-in-lake type was abundantly represented in the Birkenhead, where they constituted 10 per cent. of the run. But only one specimen was found in 1918 among 288 examples from Skookumchuck and Pemberton.

Only 6 per cent. two-years-in-lake fish were found in the Chilcotin in 1916. It seems evident that the occurrence of this type in some abundance is more probable within certain spawning areas than in others; but extensive fluctuations occur in successive years. From such evidence as is before us, it would seem that in 1918 the members of this group were exclusively bound for the Chilcotin, and perhaps other spawning-grounds above the Yale Canyon. Their distribution

in the main run becomes then a matter of special interest. Referring to our Esquimalt records, we find this class sparingly represented during the early part of June, but the number increasing during the month, until on June 28th it constituted 14 per cent. of the whole. Up to this point the history of 1918 exactly parallels that of 1916. On July 2nd they constituted 12 per cent.; July 10th, 3.5 per cent.; July 14th, 9 per cent.; July 18th, 9 per cent.; July 21st, 11 per cent.; July 25th, 11 per cent.; July 29th, 13 per cent.; August 2nd, 5.5 per cent.; August 4th, 5.5 per cent.; August 8th, 5.5 per cent.; August 11th, 2 per cent.; and subsequent dates occasionally with one specimen, but usually without any. The striking difference between 1918 and 1916, as regards the run of the two-years-in-lake type, lies in the heavier early run in 1918 and the almost total disappearance of these forms in the latter part of August. On August 10th, 1916, 10 per cent. and on August 27th 10 per cent. of the run belonged to this class. It seems highly probable that the numerous late-running individuals in 1916 were bound to streams below the canyon.

The material obtained at Fish Canyon did not differ in any respect from that obtained higher up-stream at Hanceville. The nuclear areas of the scales are characteristically marked with slender rings, not greatly crowded, nor widely spaced. The rings are fairly regular and in general parallel, but the individual rings are frequently broken and interrupted. Figs. 14 to 20 present characteristic centres of Chilcotin scales, the majority of these from the two-years-in-lake form.

The first year's growth in the sea usually averages small, with the scale-rings often crowded and irregularly spaced, indicating partial checks in the middle of the growing season. Variations are found in this regard, as is always the case, but the general picture is of a single spawning type, displaying not more than the usual amount of variation. Two forms can be roughly distinguished, one with large, the other with small nuclear regions, and these two exist among those individuals that spent two years in the lake as well as among those that migrated seawards in their second spring. No other differences have been detected between the two groups. Those with the larger type nucleus may have been the first to hatch. Intermediate individuals are found.

It was impossible to determine the age in the majority of the specimens. In thirty-three out of a total of 108 the scale was complete at some point on the margin, and made it possible to ascertain in each case that the fish when captured was in its third year since entering the sea. Those of the one-year-in-lake type were all in their fourth year; those of the two-years-in-lake type were in their fifth year. Both types had spent an equal period on the sea-feeding grounds and had reached essentially the same size. A comparison of length-frequencies of Chilcotin fish (Table I.) with those of Pitt Lake, Morris Creek, and the Birkenhead will show the much smaller range in size of the Chilcotin material. We failed to find evidence of five-year fish (one-year-in-lake type) in the Chilcotin, either in 1916 or in 1918; or of six-year fish (two-years-in-lake type), although numerous examples of these six-year fish are known to have entered the mouth of the river in June and July.

The Quesnel River.—No material was obtained from the Quesnel River. Mr. Babcock and the writer visited the dam and fishway at the outlet of Quesnel Lake on September 3rd and 4th. No salmon had been observed to enter the fishway, and only two or three which we did not secure were seen in the pool at the foot of the race. No run was reported at any later date.

Specimens were secured, mainly from drying-racks, at Chimney Creek Bridge and at Soda Creek, points on the main river between the mouths of the Chilcotin and the Quesnel. It might be assumed with some justice that the majority, if not all, of these fish were headed for the Quesnel. Along the river between Quesnel and Fort George no success appeared to attend fishing at any point. Here and there we could learn of the capture of a few strays, but that was all. Yet it is hazardous to adopt conclusions based on evidence of this nature. Some proportion of the Soda Creek and Chimney Creek fish were undoubtedly bound up-river beyond the Quesnel. What the relative numbers were it is impossible to estimate. The same kind of evidence that would convince us no fish were running in the upper river can also be adduced to demonstrate that none entered the Quesnel.

The material secured at Chimney Creek Bridge and at Soda Creek was clearly different from that obtained in the Chilcotin. For one point of distinction, there were few individuals of the two-years-in-lake type. Out of a total of seventy-one specimens, only five, or 7 per cent., were of this class, which constituted 35 per cent. of the Chilcotin fish. This abrupt change from

the mouth of the Chilcotin in the few miles to Soda Creek could have only one meaning. A distinct body of fish, developed from fry which had been hatched in the Chilcotin, had entered that river. Other minor differences marked the nuclear portions of the scales from fish taken above the mouth of the Chilcotin—differences which hardly lend themselves to description, as they appear in the ever-varying material, but nevertheless in a composite image are found to have a certain distinctness and an unquestioned significance. The nuclear rings are on the average more closely crowded, while the number of rings remains about the same, ranging widely from seven to twenty-one, with the mode at ten. The first year's growth in the sea is small, and the individuals are all of those sizes which characterize Fraser River sockeyes that have spent three years at sea. The condition of the scales permitted us to ascertain the age of but one specimen, a four-year fish, but we entertain no doubt that all the individuals observed had spent three years at sea, and were either in their fourth or fifth year, depending on whether as fingerlings they had remained one year or two years in fresh water. Fig. 21 presents for comparison the centre of the scale of a Soda Creek specimen.

Fraser River Canyon above Yale.—Fifty specimens were obtained from natives dipping in the canyon and above, as far as Lytton. Inasmuch as it is supposed no sockeyes entered the Thompson in 1918, and the Seton-Anderson section was wholly bare of spawning-fish, it would be natural to assume that sockeyes captured in the canyon above Yale were all bound for the Chilcotin and the Quesnel, and would wholly resemble the fish captured at Fish Canyon and Chimney Creek. Nothing could be farther from the truth. The Yale Canyon fish averaged much larger than the up-river fish, and contained a considerable proportion of five-year individuals, of which not one was detected above. Apparently some 30 per cent. of the fish dipped in the canyon were five years old, a much larger percentage than was at any part of the run entering the mouth of the river. The destination of these five-year sockeyes is a question of much importance. The only direct evidence we have is derived from two specimens, the only material obtained from the Thompson River—one taken two miles east of Lytton on the Thompson; the other at Thompson Siding, nine miles east of Lytton. Both of these are five years old, one 24 the other 26 inches long, and both females. Only four of the fifty are of the two-years-in-lake type, so we could not be dealing to any considerable extent with Chilcotin material. Furthermore, many of the nuclear regions of the scales are of the robust type, with strong, bold, parallel ridges, quite different from the delicate slender-ringed nuclei of the upper river. Figs. 25 to 28 illustrate certain of the types of scales characterizing the sockeyes taken in Yale Canyon and above, while Fig. 29 is from the Thompson.

We can apparently not escape the conclusion that a large proportion of these canyon fish, taken during the month of August, were bound up the Thompson River. Certainly they were *not* bound for the Chilcotin or the upper district. Although few in number, they were concentrated in the canyon, but when they reached the quiet waters above the canyon, and afterwards scattered over the immense Shuswap-Adams district, they were wholly lost to sight. If this inference is correct, it gives us the first glimpse of the Thompson race or races. The suggestion that these fish, like those spawning below the canyon, may in considerable numbers attain five years of age is an interesting one, and must be taken into account in all discussions of the four-year cycle and the striking variation in the proportion of the age-groups in the Fraser River.

Bridge River.—No material was obtained from the stretch of the Fraser between the mouth of the Thompson at Lytton and the outlet to Seton Lake at Lillooet. Above Lillooet, at Bridge River, fifty specimens were obtained from August 21st to September 8th, and proved on examination to contain a mixture of the type found in the Chilcotin at Fish Canyon, together with that secured above the Chilcotin in the main Fraser at Chimney Creek Bridge and at Soda Creek. The Chilcotin type predominated. Twenty-six per cent. were constituted of two-years-in-lake fish. The sizes ran low and the entire assemblage was markedly different from that taken at the same period and earlier in the month of August in the Yale Canyon. One specimen, a male 27 inches long, was in its fifth year, but all the others were of smaller size and apparently four-year fish. The nuclear rings of those of the one-year-in-lake form ranged from twelve to twenty-one, the smaller sizes predominating, and largely concentrated between thirteen and seventeen; the mode at sixteen. Those of the two-years-in-lake type have the rings of the first year ranging from six to eleven; those of the second year from twelve to twenty.

II. THE FRASER RUN OF 1918.

In our report for 1916 we remarked: "The run of sockeye salmon to the Fraser River in 1916 was the poorest known." In 1917 we were obliged to record the disappearance of the big year of the cycle from Fraser River runs, with no prospect of its recovery. And in 1918 the run reaches still lower dimensions than in 1916, the total catch on Puget Sound being 50,617 cases and in Canadian waters 20,955 cases, a total of 71,572 cases. This is but six-tenths the catch of 1916, the poorest previous year.

The brood-years for 1918 were 1913 for the five-year fish and 1914 for those in their fourth year, the four-year fish largely predominating, as is customary in the Fraser River. 1913 was the big year of that cycle, but big years are now known to owe their magnitude to four-year fish hatched in the upper waters of the Fraser, in tributaries which produce few or no five-year fish. The tributaries of the Fraser which are responsible for five-year fish lie below the Yale Canyon, with the possible exception of the Thompson River, and have never experienced large increases in the size of the run during the big years of the cycle. We would have no reason to expect, therefore, any unusual influx of five-year fish in 1918 because of its relation to 1913. On the other hand, the 1913 run to the Lillooet Lake section, which supports the Pemberton Hatchery on the Birkenhead, the most important spawning stream of the Harrison-Lillooet section of the river, was distinctly poorer than in any big year since the hatchery had been established there. The history of 1913 gave no grounds for hope of any large number of five-year fish in 1918.

The four-year fish were hatched from the 1914 brood stock, which would be considered of more than average size for an off-year if we relied on the figures for the commercial returns (555,557 cases). On inspecting the reports from the spawning-grounds presented by Mr. Babcock for 1914, we find, however, that serious obstructions in the canyon above Yale prevented the ascent of the salmon during the greater part of August, and hampered them greatly at other portions of the run. The result was what might have been anticipated. The numbers that reached the up-river spawning-grounds were everywhere greatly reduced. Fewer sockeye reached the Chilcotin than during any other recorded year. The run at Quesnel Lake was one of the poorest since the fishway was built in 1903, the total number that entered the lake being too small to make any noticeable showing there. Only a few hundred reached the Seton-Anderson Lake section, and the run to the Shuswap-Adams District was distinctly light. There was a fair run to Lillooet Lake and a rather small run to the Harrison.

This review of the situation is given to show how hazardous it is to predict future runs solely on the basis of the number of cases packed during the brood-years. This cannot be depended on to give reliable data on the number of fish that will succeed in spawning. A careful study of the conditions described on the spawning-beds of the Fraser in 1913 and 1914 by Mr. Babcock would have prepared us for a decidedly limited run in 1918, though perhaps it would not have foreshadowed the magnitude of the disaster.

Age-groups.—In spite of the phenomenally small size of the run, the number of five-year fish shows no marked increase above the normal, although in other years of reduced run it has frequently shown such increase. Taking into consideration those sockeyes only which remained one year in the lake before passing to sea, we find the average percentage of five-year fish in the run to have been 23 per cent., varying on different days of the run from 5 to 59 per cent. No orderly sequence was observed, although in general the heavier percentages were found in June and July. Striking changes in the relative proportions of age-groups in successive years accompanies violent alternations of good and bad years. In such cases we find the poor years in such a series are signalized on the Fraser by a high percentage of five-year fish. But when the runs have declined almost uniformly to a low level, as seems now to be the case, the age-groups regain their normal relations and remain about the same from year to year.

Succession of Types in the Run.—As in previous years, it was obvious in examining the takes of different dates in orderly sequence that changes were constantly occurring in the constitution of the run. On July 2nd and 10th, for example, two distinct types could be recognized, one with a small nuclear region, containing most frequently eight to fourteen rings, usually with a band of intermediate rings outside it, and a small first year in the sea. The nuclear rings were fine, crowded, and more or less broken, and numerous five-year fish were included in this series. The characteristics here given are so closely those of the Lillooet-Birkenhead race as to raise a presumption that the fish of this type were bound to that portion of the Fraser watershed.

The second type was marked by the large size of the nucleus, containing sixteen to twenty-two rings, and without distinct band of intermediates surrounding it. The nuclear rings are boldly drawn and strong, well spaced, and not interrupted. The first year's growth in the sea is not reduced, with more or less crowded, irregularly spaced rings, as in the preceding type, and very few are in their fifth year. This second type apparently disappears abruptly about the middle of July and is replaced by several partially recognizable strains, which, together with type number one, form a very mixed assemblage. Figs. 30 to 34 illustrate some of the different forms which appear in this run.

Tables IV. to XI. give the succession of sizes appearing on a series of dates, and indicate that the average size increases during the advance of the season, largely by the disappearance of the smaller individuals included in the early part of the run. Taking into consideration only the predominating class in the Fraser, which after hatching spends one full year (fifteen months) in the lake, the average sizes for the 1918 run are as follows:—

	Length, Inches.	Weight, Lb.
Four-year males	24.9	6.5
Four-year females	23.8	5.7
Five-year males	26.3	7.5
Five-year females	25.4	6.7

From the above it appears the conditions on the feeding-grounds at sea were normal and an average growth was effected. Compare with Table XI., page 35 of Paper No. 3 (1915), of this series.

III. THE RIVERS INLET SOCKEYE RUN OF 1918.

The Rivers Inlet sockeye run of 1918 was the third very poor run in succession. Were it not for the exceptionally favourable showing in 1915 (130,350 cases), giving evidence of extensive fluctuations for which we cannot account, the present situation would take on a grave aspect. With the spawning-beds in Owikeno Lake in unsatisfactory condition, close attention should be paid this fishing district in the following years.

The run of 1918 had a smaller percentage of five-year fish than in any previous year since the very unsatisfactory season of 1913. Rivers Inlet is predominately a five-year stream, and in general (exceptions can be noted) has shown the largest proportions of five-year fish during the most successful seasons. The five-year fish of 1918 were derived from 1913, when the fish, in addition to small numbers, were small in size for the various age-groups. But in 1918 they were far smaller, well below the average for this river both in length and in weight for all groups. The season must be considered a highly exceptional one. The males were much more numerous than the females compared with previous years, and the five-year fish pursued the very opposite course to that which they followed in 1916 and 1917. In these two years they appeared most abundantly in the early days of the run and gradually decreased as the season advanced. This is the customary method with five-year fish, not only in Rivers Inlet, but in other streams as well. But in 1918 the Rivers Inlet five-year-olds were almost wholly lacking at the beginning of the run, when on June 27th they constituted only 7 per cent. of the catch. From this date they increased regularly until July 19th, when they made 69 per cent. of the day's capture, and then maintained approximately that percentage for the remainder of the season. The reasons for such complete reversals of habit in a highly exceptional year cannot be conjectured at present.

Table XII.—Percentages of Four- and Five-year Rivers Inlet Sockeyes in Runs from 1912 to 1918, with the Broods from which they were derived.

IV. SKEENA RIVER SOCKEYE RUN OF 1918.

(1.) General Characteristics and the Age-groups.

The Skeena River sockeye-pack for 1918 consisted of 123,322 cases, and ranks among the best half-dozen years in the history of the industry. Coming as it does after two phenomenally poor years, it gives grounds for hope that the Skeena may not as yet be suffering the results of overfishing. Evidences of the decline of a run, with standardized fishing methods, are, however, generally of slow and irregular approach. The returns from this river should be most carefully scrutinized.

The necessity for this is all the more evident for the reason that some important factor which must be largely concerned in determining the success or failure of the runs remains unknown to us. Attention has been repeatedly drawn to the total lack of relation between the run of any year and the apparent size of the runs four and five years before. The year 1918 presents a striking example of this lack of correlation. Its brood-years were 1913 and 1914, and as its five-year fish constituted 59 per cent. of the total run of 1918, the year 1913 was relatively the most important. But 1913 was apparently the very poorest year the Skeena has ever experienced. The four-year fish derived from the 1913 run constituted only 38 per cent. of the run of 1917, which was but little better than 1913. There seemed no reason to anticipate that 1913 would deliver five-year fish in 1918 far in excess of its entire yield of both four- and five-year fish.

The nature of the unknown factor must be at present wholly a matter for conjecture. We have called attention previously to the effect of boisterous weather on the commercial success of a season. A stormy summer is popularly supposed largely to diminish the proportion of salmon captured. The number of cases packed during such a season might indicate a poor run, whereas the run may have been above the average, and the escape to the spawning-beds unusually large. An attempt to correlate size of pack with weather conditions has not been made. It is possible that weather may exert a directly favourable or unfavourable influence on the size of the run in any year, in addition to its effect on fishing operations. This also is a matter inviting careful investigation.

During previous years we have observed an extensive variation in the relative abundance of the two-years-in-lake group. It has varied from 7 per cent. in 1914 to 27 per cent. in 1916, but in two of the four years in which this proportion has been determined it has been 14 and 15 per cent. We have observed in other rivers a wide disparity in this regard between successive years. Evidently, at times, a much larger percentage of the yearlings fail to migrate in their second spring than is usually the case. We have no clue to the significance of this change of habit. It is perhaps to be sought in fluctuating conditions which in certain seasons are less favourable to vigorous growth of the fingerlings than in other seasons. We have previously called attention to the fact that the larger sizes of yearlings migrate at the end of their first year, while the smaller sizes more frequently remain behind for additional growth. If a racial habit has been formed in a given river favouring migration seawards when a certain average stature has been attained, a much larger proportion of individuals may fail to reach it in one year than in another.

In 1918 the Skeena River run contained what appears to be a fair average number of adults that had when fingerlings spent two years in fresh water. Fifteen per cent. of the run belonged to this class. As shown in Table XVIII., 60 per cent. of these returned at the age of five and 40 per cent. at the age of six. A tendency appears for the members of this group to run into the river in larger numbers during the early part of the season, although this tendency is not so strongly marked as in the case of the five-year fish that as fingerlings spent only one year in the lake. As shown in the table, the individuals belonging to the latter group become proportionally less abundant during the latter half of July, while the four-year fish that have spent only one year in fresh water become more abundant.

(2.) Relative Numbers of Males and Females.

A well-marked tendency for the males to precede the females was shown in 1918 in the Skeena, and is evidenced by Table XX., giving the proportions of the sexes in both four-year and five-year fish, taken at intervals of three or four days throughout the run. During the dates in June males were in excess of females generally in both groups, largely in excess in

the younger group, less so in the five-year contingent. In both groups, as the season progresses, there is an obvious increase in the number of females at the expense of the males. During the latter half of July the five-year females are greatly predominating, and the four-year females are nearly as abundant as the males of their class. Taking into consideration all the groups present in the run, the one-year-in-lake and the two-years-in-lake groups, of all ages, we find the males notably exceeding the females and constituting 57 per cent. of the entire run.

Considering the run as a unit and ignoring the fluctuations in its constitution from its origin to its close, we find the proportions of the sexes in the different groups, brought into comparison with previous years, presented in Table XXI. The close correspondence in a series of years is most striking, as is also the fact that the proportions of the sexes in 1918 represents in each of the groups the average for all the years of which we have a record. We note again that males predominate in both groups of the two-years-in-lake series. The five-year members have a slightly higher percentage of males than the six-year class, but in both classes the males are constantly in excess. It is not clear why the two years spent in fresh water in their early history should have influenced them in this manner. We should have expected males to predominate in the five-year class, while females would be equally in excess with the six-year-olds.

(3.) Lengths and Weights.

The following tables indicate that the size of Skeena River sockeyes in 1918 was fully up to the average observed over a series of years. The conditions at sea then had been favourable, and no adverse weather conditions had stunted growth during the late winter and early spring months of the spawning year. We again call attention to the comparatively unreliable averages for fish of the two-years-in-lake group, due to the small size of these groups. The weights for the year agree as closely as do the lengths. Comparing 1918 with 1915, we find the greatest difference in the average weights for the various classes is two-tenths of a pound; while the greatest difference in the average lengths equals two-tenths of an inch.

V. THE SOCKEYE RUN IN THE NASS RIVER, 1918.

The 1918 run of sockeyes in the Nass River agreed with 1917 as being far below the average take for the last ten years, which is a little over 30,000 cases. The pack in 1917 was only 22,188 cases and was the worst up to that date for the past decade. But the 1918 pack was only 21,316 cases.

The size of the fish in the different classes was not less than the average in good years. In the four-year fish of the one-year-in-lake type, both males and females were distinctly larger than in the two previous years, as is shown by both average lengths and average weights in Table XXVII., the averages used being for the July fish only. The sizes would have been even larger had the August run been included.

The July and the August portions of the run were as sharply marked as had previously been noted. The one-year-in-lake type, both four- and five-year classes, had practically disappeared from the August run, which was composed of individuals that had spent two years in fresh water in the fingerling stage, and others that had spent three years in fresh water. Representatives of both of these groups had been present also in July, but the July individuals, in all the groups that spent two years in the lake, averaged distinctly smaller than the August fish of the same classes. It would be interesting to follow the August fish to their spawning-grounds, which are probably distinct from those of the early run.

STATEMENT SUBMITTED TO THE AMERICAN-CANADIAN FISHERIES COMMISSION BY THE HON. WILLIAM SLOAN, COMMISSIONER OF FISHERIES, AT THE VANCOUVER MEETING, 1918.

Gentlemen of the Commission,—As the Commissioner of Fisheries for the Province of British Columbia, I desire to comment briefly on the present precarious condition of the sockeye-salmon fishery of the Fraser River. The watershed of that river and its channels lie wholly within the Province. From its watershed have come all but a fraction of the sockeye that have been taken in the waters contiguous to the International Boundary-line which separates the Province of British Columbia and the State of Washington. From that watershed must continue to come the seaward migrants of sockeye which produce the commercial runs of sockeye to those waters, because there is no other watershed tributary to those waters which affords sufficient spawning and rearing waters for sockeye salmon. The vast runs of former big years demonstrates the extent and the value of the runs that that watershed can produce. It is the greatest sockeye-producing watershed known. No other watershed has produced such vast numbers of sockeye. That watershed is to-day as capable as ever of producing the vast run of the past. It has not been contaminated. Settlement, power and irrigation have not injured it in any way. It needs only to be protected to produce the great runs of the past. Its produce has been lessened—almost destroyed—because a sufficient number of spawning sockeye has not been permitted to reach it. The runs in the three last years have steadily decreased because too few of the adult salmon have escaped capture in Dominion and State waters; because of excessive fishing too many have been captured. The run of the big year was further destroyed by a rock-slide blocking the river-channel at Hell's Gate in 1913.

That the runs in the three last years have been almost wiped out by commercial fishing and that the run in the big year has been alarmingly decreased has been ably demonstrated by statements already submitted to you. It is unnecessary here to more than call your attention to the evidence of depletion already in your hands. I do, however, accentuate the fact that the evidence submitted to you by our Department is founded upon scientifically ascertained facts. The watershed of the Fraser and the fishing areas supplied by it have been under close scrutiny since 1901. No other has been so carefully observed. The history of the race of sockeye that frequent the Fraser is better known than that of any other district. The facts are no longer questioned. The run of sockeye to the Fraser is periously near to extermination. They will be exterminated if conditions remain as they are, and in so short a period as to wipe out all interests of both fishermen and canners. In view of the evidence there is, in my judgment, but one thing to do. Adopt measures that will ensure to the watershed all the sockeye that still survive. To that end I would suggest that the total prohibition of sockeye-fishing in the waters frequented by those produced in the Fraser River until such time as they have recovered from their depleted condition. I suggest this though it does involve compensation to resident fishermen and canners who can establish that they are entitled to compensation by their respective Governments. It is fruitless to rely upon concurrent regulations in British Columbia and the State of Washington waters. That has been tried and failed. Such efforts will continue to fail. Present commercial and monetary considerations must be eliminated. It must be in an international way, because it is an international question. It is one of the greatest fishery questions in which Canada and the United States are now concerned. The only adequate, the only permanent solution of this question, I submit, is the acquisition by Canada and the United States of all the rights in this fishery of which they may not now be in possession. That being established, the waters should be closed to sockeye-fishing for such a period of time as is necessary to restore the runs to the abundance of former big years. When that has been accomplished, let fishing be resumed under supervision and for the benefit of the two nations until such time as they have been recouped for their expenditures, and thereafter in such manner and to the end that the supply may not again become depleted.

I submit, gentlemen, that the Governments of Canada and the United States should recognize that the conditions confronting them demand such treatment. There is no gainsaying the evidence. The watershed of the Fraser River will, when adequately protected, produce more

sockeye salmon than any known watershed. It produced in 1913 2,300,000 cases. In the three following lean years it produced an average of but 267,000 cases per year. Being in possession of a watershed capable of producing 2,300,000 cases a year, can any Government be content with conditions by which but 267,000 cases are produced, and the continuance of which will entirely destroy any production whatever? The evidence in the case is conclusive—it is undisputed; the fishery is in a precarious condition. There is, however, a difference of opinion as to the remedies to be applied. I submit that those best qualified to speak have made it plain that no temporary measures will produce desired results. The races of sockeye that frequent the Fraser cannot be restored by any half-way measure. To allow the destruction of the sockeye-fisheries of the Fraser River would be an unnatural, immoral, and unpatriotic policy.

The questions here involved are similar to those in the fur-seal case. They are international in character, and not Provincial or State questions, and must be dealt with upon broad national lines and in the interests of the people of Canada and the United States.

Faithfully yours,

WM. SLOAN,

Commissioner of Fisheries for British Columbia.

STATEMENT MADE BY JOHN P. BABCOCK, ASSISTANT TO THE COMMISSIONER OF FISHERIES FOR BRITISH COLUMBIA, AT VANCOUVER MEETING OF THE AMERICAN-CANADIAN FISHERY CONFERENCE, 1918.

MR. CHAIRMAN AND GENTLEMEN OF THE INTERNATIONAL FISHERIES COMMISSION,—The outstanding features of the salmon-fishery of the Fraser River District, in my judgment, are the depletion of the runs and the potentialities of the watershed. Because depletion has been shown, and is universally admitted, I shall confine attention to the latter.

The Watershed,—The watershed of the Fraser River contains a greater area of tributary fresh-water lakes than are found in any other on the Coast. The Fraser drains the major portion of the south-eastern section of the Province of British Columbia. Three of the largest lakes on the Pacific slope and five others of large area contribute their waters to the Fraser and afford spawning areas and rearing waters for a countless number of sockeye salmon. No other known watershed affords such an extended spawning area. No other watershed produced in a single year such vast numbers of sockeye. The great runs of 1901, 1905, 1909, and 1913 demonstrate the harvest that watershed will afford when abundantly seeded. The great catches of those years—ranging from 1,572,000 to 2,401,000 cases—demonstrates the number of fish that may safely be taken without injury to the runs of the future, because, notwithstanding such great catches, every section of the spawning area of the watershed was shown to have been abundantly seeded in 1901, 1905, and 1909, and there is evidence to show that its spawning area would have been as abundantly seeded in 1913 but for an accident.

Since 1901 I have made a study of conditions on the fishing and spawning grounds of the Fraser River. I first inspected its spawning area in 1901. As the agent of the Provincial Government I have inspected that watershed during the spawning period every year since, with the exception of the years 1910 and 1911. The annual publication of the Provincial Government contains my yearly reports.

As the result of my inspections, I feel fully justified in submitting that the major portion of the great runs of 1905, 1909, and 1913 were the product of the sockeye that spawned in that section of the watershed of the Fraser that lies north of the great canyon in the Coast ranges, commonly termed "the Fraser River Canyon." And that the major portion of the runs in the alternate years—the lean years—were the product of the sockeye that spawned in that section of the watershed that lies to the south and west of the Fraser River Canyon. In the discussion of this question the former is here termed the upper section of the Fraser River watershed, and the latter the lower section of the Fraser watershed. In my judgment, the great runs of

the big years have very largely consisted of fish propagated in the upper section, plus the normal yearly product of the lower section. The runs in the alternate, or lean, years have been the normal yearly product of the lower section plus the small numbers produced in the lean years from the beds of the upper section.

In the big years 1901, 1905, and 1909 every spawning-bed in the upper section was crowded with sockeye. They were found there in incredible numbers. The beds of that section in 1913 showed an alarming decrease. While over 4,000,000 sockeye were recorded as entering Quesnel Lake in 1909, but 550,000 were shown to have entered that lake in 1913, and less than 28,000 in 1917. Furthermore, similar conditions were shown to have existed in all the lake districts of the upper section in 1913 and 1917. The number of sockeye that reached the beds of the upper section in 1917 were shown to have been very much less than in 1913, and little, if any, more numerous than in some recent lean years. The records of the upper section in 1913, and again in 1917, demonstrate that the conditions which produced the big runs in 1905, 1909, and 1913 no longer exist, that the big year run has been destroyed, and that hereafter the runs of those years must be classed with the runs in the lean years. In the alternate—the lean—years the spawning-beds of the upper section were but sparingly seeded up to 1906 and have not been as well seeded since. Gradually, with one or two exceptional years, the number of sockeye which reached the upper section in the lean years has notably declined. Every district in the upper section shows a decline. Hatcheries located at Shuswap and Seton Lakes, the only hatcheries in the upper section, have been closed because a sufficient number of sockeye have not reached those lakes in recent years to afford a supply of eggs. No eggs were or could have been collected at either of those lakes in the last three years.

Passing to the spawning area of the lower section of the Fraser, the record discloses that from 1901 to 1917 there was no pronounced increase in the run in the big years over the run of the lean years. That there has been as many fish on those beds in the lean years as in the big years. This is especially true of the runs to Lillooet and Harrison Lakes, the two great lakes of the lower section. The runs to this section have shown a steady decline. There were less sockeye in this section in 1917 than in any former year, big or lean, on record, and less eggs were secured for the hatcheries.

Because the bulk of the run of the big years issues from the upper section of the watershed, and because there has been no noticeable increase in the number of sockeye on the beds of the lower section in those years, it appears that the condition which originally brought about the phenomenon of the big run and the three following small runs of sockeye to the Fraser was of such a character as to have affected only the run to the upper section and yet did not affect the run to the lower section.

Because the run to every lake district of the upper section was equally affected we are warranted in assuming that the point of obstruction was located below the junction of the Thompson and the Fraser Rivers. Because the run was affected for three years only, it is assumed that the barrier, or blockade, was of such a character as to have affected the run in those years only and did not affect the run in the fourth year; that in the fourth year it had worn away or been removed by high water to an extent that permitted the run of that year to reach the spawning-beds of the upper section.

The channel of the Fraser through the canyon extending from Yale to Cisco is exceedingly narrow at many points. Towering cliffs of rock line its banks. A rock-slide such as the one that occurred in that canyon, at Hell's Gate, in 1913 could easily have produced a similar result at an earlier period of time, and just as effectively cut off the run for a number of years as the slide of 1913 would have done had it not been removed by the Dominion Government in 1914. Great as was the slide of 1913, it did not cut off all of the early run of sockeye of that year. Owing to extreme high water in July numbers of sockeye were enabled to pass through, as was demonstrated by the fish reaching Quesnel and Chilko Lakes.

Assuming, then, that we have here a reasonable theory of the origin and the nature of the barrier that cut off the sockeye from the spawning area of the upper section of the Fraser which resulted in the phenomenon of the one big year and three lean year runs of sockeye, let us speculate as to the extent of its effect upon the runs of the three lean years. The barrier may have been sufficient to have cut off a portion of the run only, or it may have cut off the entire run. If a portion of the run at extreme high or low water was enabled to pass, that portion would have furnished the nucleus—the seed—for a run four years later.

If we assume that the entire run was cut off from the upper section for one or all of the three years of the cycle, we must furnish a plausible, a workable, theory to account for the restoration of the runs in the three lean years. That is not difficult. Dr. Gilbert, by his study of the growth and structure of the scales of the sockeye, has demonstrated that, while the race of sockeye that frequent the Fraser are predominately four-year old fish, there is in the run of every year three-year-old, four-year-old, and five-year-old fish. He demonstrated "clearly that in the Fraser basin a high percentage of four-year fish accompanied a large pack, or, stated conversely, a small pack is occasioned mainly by a deficiency in four-year-old fish."*

In four runs he found an average of 82 per cent. of four-year-old fish. In the catch of 1912 he found 21.5 per cent. of three-year-old fish and 10 per cent. of five-year-old fish. The presence of from 54 to 99 per cent. of four-year-old fish in five consecutive runs, and plus per cent. to 46 per cent. of five-year-old fish in the same runs, establishes the fact that from each year's spawning a proportion of five-year-old fish are produced. We have here evidence of the existence in the run of the year that was not obstructed the nucleus for a future run. The period taken to build up a run from such a scant seeding must have been an extended one. Had this constituted the only seed that reached the beds in the three lean years, the run following the big year should have been more readily built up than the run in the two following years. In fact, the record of the pack demonstrates that the catch in the year following the big run has always been greater than in the two following years.

We are not, however, confined to the conclusion that if the run for three years was entirely destroyed the run in the lean years was built up entirely from the spawning of five-year-old fish. Granting the premises of the home-stream theorists that salmon bred in a stream return to that stream to spawn because the weight of evidence favours their contention, there is abundant evidence on this Coast and in New Zealand, where the Pacific salmon have been established, to show that some of the salmon bred in one stream have on reaching maturity entered a different stream to spawn. Further, it has not been shown or claimed that all the fish bred in a watershed return to the identical tributary of that watershed in which they were propagated. There is sufficient evidence to warrant the conclusion that some salmon propagated in the lower section of the Fraser have entered the upper section and spawned there. We have therefore three strings to our bow to account for the existence of the runs of the lean years: (1) The escapes at high or low stages of water during the original blockade; (2) the overlapping five-year-old fish bred in the upper section by the run that did survive; and (3) the fish bred in the lower section that passed to the upper section and spawned there.

The building-up of a run to the upper section of the Fraser by any or all of the measures here indicated would of necessity have taken a long period of time. We cannot estimate it, but we are not compelled to place it in the dark ages, or even two or three centuries ago. We can, however, postulate that during that period the Indians of the upper section and in the Fraser Canyon were catching such fish as they could secure up to the limit of their demands, and were in consequence interfering with a more rapid development of a run. The records of Simon Fraser, the discoverer and original navigator of the river that bears his name, written more than a century ago—1806-11—establishes the fact that there was in those years a big run every fourth year and a light run in each of the three succeeding years in the Upper Fraser. He also furnishes evidence to show that in some of the lean years the Indians at Stuart and Fraser Lakes could not supply his post with all the salmon he required, and that an additional supply was obtained from the post at Kamloops, where the run appears to have been larger or the demand less; indicating at that time the Indians could not obtain from Stuart and Fraser Lakes all the fish they desired.

This matter has been treated at length that it may be appreciated that the period of time necessary to restore a depleted run to a run of commercial importance is under natural conditions a long one, and because it has been stated that the failure of nature to have equalized the runs of sockeye in the Fraser demonstrated that the runs in the lean years could not be developed to the proportions of a big-year run. I sumbit that there is no force in that contention. The runs in the lean years will equal the runs of former big years four years following as abundant seeding as the beds received in either 1901, 1905, and 1909. It is only a matter of seeding the spawning area abundantly.

* B.C. Fishermen Report, 1915, pages 29 and 30.

Mr. Secretary Redfield requested that in advocating restrictive measures I should consider the present demand for foods, and that he would like me to express my views on the subject. In reply, let me submit: The average pack of Fraser River sockeye in Washington and British Columbia in the last three lean years totalled but 267,000 cases. The reports from the spawning-grounds of the Fraser in these years give no promise that the runs in the following three lean years will equal that average. If that be true, the best we can expect is *267,000* cases per year. Is the food shortage so serious as to demand that the few remaining sockeye of the Fraser run be drawn upon to supply that number of cases?

Permit me, gentlemen, to draw my remarks to a conclusion by quoting from the very able statement furnished you by my mentor, Dr. Gilbert:—

"The Fraser River presents unexampled opportunities for productiveness and wealth. The people need the enormous supplies of highly valuable food which the river is able to produce annually. It should not be permitted to remain at its present low rate of production. . . . The people need the food. They will come to need it in future years even more sorely than they do at the present. No private interests should be permitted to stand in the way of restoring this producer of food to the public.

"If the Fraser River were a private monopoly, to be henceforth wisely handled, there can be no doubt it would now be promptly closed to commercial fishing for a term of years, and the entire run—now so sadly dwindled—dedicated to purposes of propagation. This should be done without further delay for at least one cycle of four years, and the results carefully noted by a continued study of the spawning-beds. . . . If the river were closed to fishing for one cycle of four years, we could know fairly well in advance what the result was to be, and could then either open the river and sound to restricted fishing if conditions should warrant, or, if necessary, close it for a future period of four years. This is the only method to restore the sockeye run with any promptness and with any certainty of success.

"So great has been the reduction of the runs, we cannot predict with any optimism what would be the result of less drastic measures. If the amount of fishing-gear in use be limited and the weekly closed season be extended, undoubtedly a somewhat larger proportion of fish would reach the beds. But it must be borne in mind that it is not the proportion of a given run which spells success, but the actual numbers of spawners. The whole of a sadly depleted run may be all too few to produce the desired results. It is greatly to be feared that any restriction in the present case which would be so moderate as still to leave it profitable for canners to operate in the face of such reduced runs can accomplish little or nothing towards restocking of the river. The only wise course—the only adequate remedy—is to close the river for a term of years by concurrent action of the two Governments."

Yours respectfully,

JOHN PEASE BABCOCK.

Assistant Commissioner of Fisheries.

MIGRATION OF ADULT SOCKEYE SALMON IN PUGET SOUND AND FRASER RIVER.*

By Henry O'Malley, Field Assistant, U.S. Bureau of Fisheries, in Charge of Operations on the Pacific Coast, and Willis H. Rich, Field Assistant, U.S. Bureau of Fisheries.

INTRODUCTION.

During the American-Canadian Fisheries Conference on the Pacific Coast in April and May, 1918, the question was constantly raised as to the time required for the sockeye salmon of Fraser River to pass through Puget Sound.

In order to determine this important question, Dr. Hugh M. Smith, United States Commissioner of Fisheries, and W. A. Found, Superintendent of the Canadian Fisheries, decided to carry out an extensive marking experiment. Early in July the authors were detailed to take immediate charge for the United States Bureau of Fisheries, and to confer with Lieut.-Colonel F. H. Cunningham, acting for the Canadian Government. The final arrangements were that the Canadian fisheries authorities would handle the marking operations in Canadian waters and the United States Bureau of Fisheries the marking operations in Puget Sound, and that each Government would attend to the collecting of data in its respective waters.

The authors are especially indebted to H. J. Todd & Sons; E. B. Deming, Pacific American Fisheries; W. A. Lowman, Coast Fish Co.; Frank Wright, Carlisle Packing Co.; and J. W. Elliott, Alaska Packers' Association. Without the co-operation of these men and the members of their respective organizations it would have been impossible to have successfully conducted this experiment. L. H. Darwin, Washington State Fish Commissioner, and his deputies also rendered valuable assistance. Many helpful suggestions were received from Dr. Charles H. Gilbert, of Stanford University.

PROCEDURE.

Tags and their Attachment.

The method adopted for procuring the desired data was to mark with serially numbered tags enough adult sockeye salmon so that a sufficient number of returns could reasonably be expected. After consideration of several types of tags the one finally accepted was of the "bachelor-button" type, similar to those in use for marking cattle and other live stock. This button comes in two separate halves, each with a hollow central extension which forms the shaft of the complete button. The shaft of one half of the button is small enough to pass through the shaft and long enough to extend slightly beyond the face of the other half. When placed together in the proper position the two halves are fastened by means of a special crimping-tool. This is built on the general plan of a pair of pliers; but the jaws meet only toward the tips, at which points are conical elevations. By fitting these elevations into the open ends of the shaft and closing the tool firmly, the end of the smaller inner shaft is spread sufficiently to prevent its being pulled back through the outer shaft.

The buttons were made of either silver or aluminium. Some fear was entertained that the aluminium might corrode in the salt water sufficiently to make it difficult or impossible to read the numbers, but in this experiment there was absolutely no difficulty on this account. No corrosion is noticeable on any of the buttons returned, although some of them must have been three or four weeks in practically pure salt water. This is contrary to the experience of Greene,† who found that salt water had a strongly corrosive action on aluminium buttons of similar style. This may be due to some slight difference in the alloy of which the buttons were made.

---

* Reproduced from advance sheets furnished the Department by Dr. Hugh M. Smith, United States Commissioner of Fisheries.

† Greene, Charles W.: The Migration of Salmon in the Columbia River. Bulletin, U.S. Bureau of Fisheries for 1909, Vol. XXIX., pages 129-148. Washington, 1911.

The buttons were attached to the upper lobe of the caudal (tail) fin. It was first necessary to cut a hole of the proper size to admit the shaft of the button. This was done by means of an ordinary leather-punch. Figs. 1 to 4 show, *in situ*, both sides of two buttons which were returned.*

The operation of attaching the tags required, usually, less than one minute and no particularly unfavourable results of tagging were noticed. At some of the stations where the marking was done the fish were held in crates until after the marking for the day was complete, and it was noticed that they soon recovered from the effects of being out of water while the tag was being attached and were apparently in perfect condition when liberated.

Reports that the tags were "worrying" the fish and causing them to wear their tails in an effort to remove the tags were investigated and found to be quite unfounded. Tails of several fish have been preserved and show no indication of such wearing as had been asserted. Figs. 1 and 2 are from such a specimen.

The fish to be marked were taken from the traps at the time of lifting and were held either in crates or in one of the pockets of the spiller until they could be marked and released.

Marking-stations.

Marking-stations were established at five points in Puget Sound, as follows: Near Sooke, Vancouver Island, British Columbia; Salmon Banks, just south of San Juan Archipelago; near Point Partridge, Whidbey Island; near Village Point, Lummi Island; and at the last trap in American waters on Point Roberts. For convenience these have been designated in the following pages as Stations A, B, C, D, and E, respectively.

The work at these stations was in charge of the following men:—

A. Sooke, B.C.—W. H. Rich, Field Assistant, United States Bureau of Fisheries (July 14th to 23rd); Dr. C. McLean Fraser, Director of the Biological Station, Nanaimo, British Columbia (July 23rd to the end of the season); Alex. Robertson, Superintendent, Harrison Lake Hatchery, Dominion Fisheries Department.

B. Salmon Banks—Walter C. Buckmaster, Apprentice Fish-culturist, United States Bureau of Fisheries.

C. Point Partridge—Clive L. Henry, Apprentice Fish-culturist, United States Bureau of Fisheries.

D. Lummi Island—Don E. Courser, Apprentice Fish-culturist, United States Bureau of Fisheries.

E. Point Roberts—Joseph Kemmerich, Foreman, United States Bureau of Fisheries.

The last four of these stations were under the general supervision of Dennis Winn, Field Superintendent, United States Bureau of Fisheries.

Collection and Organization of Data.

In the collection of data reliance was necessarily placed in fishermen, trap-tenders, and cannerymen. A reward of 25 cents was offered for the return of each button accompanied by information giving the date and place of capture. Specimens taken in American waters were taken care of by Dennis Winn, at the Seattle office of the United States Bureau of Fisheries, and those taken in Canadian waters by Colonel Cunningham, at the office of the Dominion Fisheries Department at New Westminster, British Columbia. One of the tags reported from the upper regions of the Fraser River was secured by J. P. Babcock, Assistant to the Commissioner of Fisheries for the Province of British Columbia.

While the majority of these records are considered approximately correct, data secured in this manner are necessarily subject to some inaccuracies, both as to time and place of capture. In the authors' opinion, however, these inaccuracies will be balanced, so that with reasonably large series the averages should be reliable. In cases where the data were obviously wrong the records have been omitted. This has been done in several instances where the date given for the capture was earlier than that on which the fish was recorded as having been marked. A number of tags were returned with incomplete data, either the date or the place of capture, or both, wanting. All such cases have been omitted entirely from consideration.

For the convenient organization of the data the American waters of the sound from which returns were reported have been divided into nine regions. Several factors guided in establishing

the boundaries of these regions: (1) The general geography of the district; (2) the grouping of traps; and (3) the nature of the descriptions giving the locality where the tags were recovered. These last frequently indicated merely the general region in which the tag was taken; i.e., Rosario Strait. The boundaries of these regions, as well as the location of the marking-stations, are shown on the accompanying map. All of the records reported from the Canadian waters which are open to commercial fishing have been treated together. For this reason that part of the Strait of Georgia just outside the mouths of the Fraser River and the river itself, from the mouth to Mission Bridge, together constitute the tenth region. The reasons for so treating the Canadian returns will be given later.

STATISTICAL STUDY OF DATA.

General Features.

In the following study the chief concern is with what is believed to be a strict and reasonably complete presentation of the facts. There has been no attempt to draw conclusions regarding the bearing of these facts upon the particular problems connected with the conservation of the sockeyes of the Fraser River. Some of the tables present similar data as seen from different points of view. This has, perhaps, been carried to an extreme in order that all obtainable facts might be available. Other tables are presented rather as matters of record than as having any especial bearing on the main problems in hand. For the most part such tables are presented without detailed comment.

Raw Data.

Table 1 gives for each marking-station the numbers of the tags attached each day. As noted in the table, silver tags were used only at Sooke (Station A). At all other stations aluminium tags were used, and the first few tags used at Sooke were also of aluminium, Nos. 5 to 29, inclusive.

* Ebey's Landing, below Point Partridge.
† Otter Point, Vancouver Island.
‡ The record is September 18th, but this is possibly a mistake, and the more probable date is August 18th, as tabulated.

Percentage of Returns.

Table 3 shows the percentage of returns from each day's marking at each station. The data from which the percentages were obtained are also given. In general the returns indicate that the marking was quite uniformly successful. This is especially true with that done at Stations B and D. The marking done at Station A suffered somewhat in efficiency for a few days at the time the change was made in the personnel, but otherwise is satisfactory. The records from Station E show a sudden diminution in the percentage of returns on August 8th and for the following three days on which fish were marked. No explanation can be given for this. As noted (note to Table 1, Station C), the accuracy of the August records for Station C is subject to considerable question, and the operator at this point has admitted reporting incorrectly the number of fish marked on August 6th. But 2 out of 164 reported marked on this date were recovered, a much lower percentage than was obtained from any other day's marking. These facts have thrown the record of marking done at this station during August so much under suspicion that it was considered necessary, in certain phases of the study, to disregard entirely the returns.

It is important to call attention to the fact that the figures given in Table 3 cannot be accepted as giving any adequate idea of the percentage of fish entering from the ocean which are caught while passing through the waters where commercial fishing is permitted. Several indeterminate factors must modify the percentage of returns to such an extent that, while they are reasonably comparable *inter se*, the actual figures give a much-distorted idea of the toll taken from the run as it is passing through the sound and river. Two of these factors are especially obvious, i.e.: (1) The figures as given here do not include all of the actual returns since some were omitted on account of faulty or incomplete data; the error from this factor, however, is not great, approximately 5 per cent.; (2) a much more important source of error is due to lost tags. There are no means of knowing just how many were taken and not turned in. Nor can anything more be learned as to the number of tags lost from the fish between the time they were attached and the time the fish were captured. Numerous reliable reports came to us of fish which showed a split in the tail-fin terminating in a hole similar to the one made with the leather-punch. Apparently the tags had in some manner become caught and pulled out. Another possibility is that some of the fish were unable to stand the operation necessary to the attachment of the tag, more particularly the attendant handling and removal from the water.

All of these factors would tend to increase the percentage of fish captured, but obviously there are no means for determining to what extent.

Percentage returned 26.8

Among the specimens listed in Table 2 the following were recorded as having been taken outside the limits of the regions indicated on the map:—

	Days out.
1 specimen, Burrard Inlet, marked August 5th, Station E	103
2 specimens, Ebey's Landing, marked July 24th, Station C	17
1 specimen, near Sooke, British Columbia, marked July 26th, Station C	11
2 specimens, near Sooke, British Columbia, marked July 27th, Station A	1-5

1 specimen, near Sooke, British Columbia, marked August 28th, Station A 4
4 specimens, near Sooke, British Columbia, marked July 20th, Station A . 2
1 specimen, near Sooke, British Columbia, marked August 2nd, Station A .. 2

These specimens from without the limits were so few that they have been omitted from further consideration. It seems probable that, with the exception of the specimens marked at Station A and taken near Sooke, these represent runs of sockeyes which were bound to some stream other than the Fraser River.

In the following tables separate consideration has been given to those fish which came from the tributaries of the Fraser and from the main river above Mission Bridge. The problems connected with the fish from these upper waters are sufficiently distinct from those connected with the fish taken by commercial fishermen to demand such separate treatment.

Table 4 gives the number of specimens returned (1) from the main commercial fishing-grounds, (2) from the Upper Fraser River, and (3) from outside the limits which we have set.

Detailed Study of Returns from the Commercial Fishing Districts.

Two tables have been prepared for each of the marking-stations, presenting in detail the data obtained from the marking: First, a table showing for each day's marking the number and percentage of specimens recovered from each region and the average number of days required for the journey; second, a table showing the distribution of returns according to the region from which the return was reported and the number of days en route. This last is given as a matter of record and in order to show something of the range of variation underlying the average rates of progress as given in various other tables. It is upon the data given in these tables that the general discussions of the routes and rates of travel which immediately follow are based.

* No specimens marked at Station E were recovered in Regions 1, 2, 3, 4, and 5.

It was hoped that much more detailed information as to the migration up the Fraser River might be presented, and to that end the river and the waters of the Strait of Georgia around the mouth of the river had been divided into twenty regions, each comprising about five miles of the river or off shore about the mouths. The returns from Canada were at first studied on this basis, but it finally became clear that the subdivisions were much too small to give results of any significance. These twenty regions were then divided into seven, as follows:—

Region 10. Banks off the mouth of the South Arm and Canoe Pass.
Region 11. South Arm and Canoe Pass up as far as Deas Island.
Region 12. South Arm from Deas Island to New Westminster.
Region 13. Banks off the mouth of the North Arm.
Region 14. North Arm.
Region 15. Fraser River from New Westminster to the mouth of Pitt River.
Region 16. Fraser River from the mouth of Pitt River to Mission Bridge.

Table 15 gives the number of specimens which were marked at each of the marking-stations recovered from each of these regions, and the average number of days en route. It is apparent from this that even with this increase in the size of the regions no significant and consistent difference in the length of time required to reach the different regions appears, and for the purposes of statistical analysis it was necessary to consider all of the returns from the main Canadian waters as constituting a single group, and to combine Regions 10 to 16 into one region, 10. It is much to be regretted that the data are not such as to make possible a reliable estimate of the rate of travel in the river itself. Whether this is due to the manner of collecting and recording the data cannot be stated. Although these records from Canadian waters do not admit of detailed analysis, when combined as a single group they agree well with the results obtained from American waters.

Routes taken by Fraser River Sockeyes through Puget Sound.—Tables 17 and 18 show in complementary ways the distribution of returned fish according to the station at which they were marked and the region in which they were taken. Table 17 gives the percentages of the total returns from each station which were taken in each region and Table 18 the percentages of the total returns from each region which were marked at each station. The returns from Regions 3, 4, and 5 are practically negligible. It is quite obvious that the great majority of the fish, on entering the Sound through the Strait of Juan de Fuca, pass across to Washington Sound, and especially the southern shores of the southern islands of the San Juan Archipelago (Region 1) and the western shore of Whidbey Island (Region 2); 8.8 per cent. of the returned fish which were marked at Soeke were taken in Region 1 and 11.8 per cent. in Region 2.

E	..	..	..	..	1.4	3.8	5.1	11.9	57.3

* No specimens were recovered in Region 5.

There is apparently considerable interchange of fish between Regions 1 and 2, as is evidenced by the fact that 9.6 per cent. of the returned fish marked at Station B, located in Region 1, were taken in Region 2, and that 11.4 per cent. of the fish marked at Station C, in Region 2, were taken in Region 1. From the region of Washington Sound a very few fish pass northward through Haro Strait (Region 4), but the proportion must be small compared with those passing through Rosario Strait and on up through the Strait of Georgia. The apparent proportions may, however, be modified by the fact that there are many more traps in Rosario Strait than in Haro

Strait. The few fish taken in Haro Strait came from Stations A, B, and C, as would be expected. Only two specimens were taken in Deception Pass, both marked at Station C. No fish are recorded as having been taken in the central channels of the San Juan Archipelago.

From the southern part of the Strait of Georgia (locally designated the Gulf of Georgia) the fish pass Point Roberts and enter Canadian territorial waters. Very soon thereafter they must enter the river, especially through Canoe Pass and the main mouth of the South Arm, and begin their journey up the river to the spawning-grounds.

In summarizing, the route followed by the very great majority of the salmon entering the Strait of Juan de Fuca and bound for the Fraser River may be stated as follows: Across Washington Sound to the "Banks" south of the San Juan Islands and to the western shore of Whidbey Island; from here northward through Rosario Strait to the Strait of Georgia, past Point Roberts to the mouths of the Fraser River. There is no evidence to indicate that this route is varied in different parts of the season.

As might be expected, this route is well indicated by the location of the various trap-sites. The approximate number of traps in the various regions of Puget Sound for which licences were issued in 1918 is as follows:*—

Region 1	14	Region 7	11
„ 2	20	„ 8	40
„ 3	13	„ 9	39
„ 4	11		
„ 5	4	Total	178
„ 6	26		

In addition to the above, there are six traps located on the Canadian side of the Straits of Juan de Fuca, on Vancouver Island, eleven scattering traps along the southern shore of these straits, and twenty-nine in Admiralty Straits, chiefly between Admiralty Bay and Double Bluff. There are also a few in Hood Canal and that part of the sound extending south past Seattle, Saratoga Passage, and Padilla Bay. The ones listed above are those of chief concern here.

There is apparently only a very low degree of correlation between the number of traps and the number of marked fish taken in any particular region. In Table 19 the six regions from which most of the returns came have been arranged in the order of the number of traps located in each. Then is given, for each region, the percentages of fish marked at Stations A and B which were recaptured in the respective regions. No correlation is apparent between the number of traps and the returns from Station A. There seems to be a distinct correlation in the case of the returns from Station B (especially if Region 6 is omitted), but the correlation is not well proportioned.

Table 19.—Correlation between Number of Traps in Various Regions and Number of Marked Fish taken in those Regions.

Region.	Number of Traps.	Percentage of Returns from Stations.	
		A.	B.
7	11	4.12	4.98
1	14	1.44	5.86
2	20	1.95	6.23
6	26	2.87	3.28
9	39	1.82	8.31
8	40	3.35	8.62

In a few instances a retrograde migration has apparently taken place and the fish have travelled away from rather than toward the mouth of the Fraser River. It is possible that faulty data may account for this, especially in such extreme cases as those fish marked at Station D and reported taken in Regions 1 and 2; or it may be that these are not Fraser River fish, but are sockeyes bound for some other stream.

* Based upon licences issued by the Fish and Game Commission of the State of Washington.

Rate of Migration.—A number of the preceding tables give, variously grouped, the average number of days required to pass from each marking-station to each region. Tables 5, 7, 9, 11, and 13 show the total range of variation in this regard for each station, and the general averages for each station are shown in Table 16. From the last-mentioned table it is apparent that, as would be expected, the time en route usually increases as the distance between the station and the regions where the fish were recovered increases. Those fish which were captured in the same region in which they were marked—such, for instance, as were marked at Station B and recovered from Region 1—have evidently been slow to resume the migration after the marking. Forty-nine specimens marked at Station B were taken in Region 1 after being out an average of 2.4 days. From Station C thirty-four specimens were taken in Region 2 after an interval of 3.8 days. Eleven specimens from Station D were taken in Region 7 after an average of 3.3 days, and twenty-seven specimens from Station E were taken in Region 9 after 5.8 days. It seems quite clear that, in the case of fish which have been recaptured comparatively close to the point at which they were liberated, the rate of progress is slower than that of fish taken a greater distance from the marking-station. Also, as may be seen from Table 16, in cases where a retrograde migration has taken place the rate of progress has usually been slow. These occurrences may possibly be due to some slight injury, or other unfavourable result, due to the handling attendant upon tagging. It may also be due to inaccurate data. In either case it would seem justifiable, when estimating the normal rate of progress through the sound, to consider only those cases of forward migration in which the fish have travelled a reasonably long distance from the station at which they were marked, say not less than twenty miles.

In the case of the Canadian records it will be noted that the correlation between the distance travelled and the time en route is very low. The average time required to pass from Station E, at Point Roberts, into the Fraser River is 6.6 days. This would indicate a much slower rate of migration here than in other parts of the sound. In order to throw additional light upon this point, the difference between the time required for fish marked at Stations A, B, C, and D to reach the vicinity of Point Roberts (Region 9) and that which elapsed before the fish from these same stations were taken in Canadian waters has been calculated as follows:—

	Days.
Station A	3.3
„ B	0.9
„ C	3.3
„ D	5.6
Average (simple mean)	3.27

This indicates a rate of progress between Point Roberts and the Fraser River over twice as rapid as that indicated solely by the results of the marking at Point Roberts, and one agreeing much better with the results obtained from the American records.

The previous tables have shown the rate of travel as the number of days required to pass from the marking-station to the various regions of the sound. In order to make these figures comparable, the rate in miles per day has been calculated for each instance. This has been done by simply dividing the distance travelled by the time required to make the journey. Table 20 gives the distances from each marking-station to each of the established regions of the sound. These distances were measured, by means of an ordinary map measure, from the marking-station to approximately the centre of the region in question. The most direct route possible was chosen.

*Table 20.—Distances on Puget Sound from Marking-stations to Regions where Fish were taken.**

Station.	Region.	Miles.	Station.	Region.	Miles.	Station.	Region.	Miles.

* No specimens were taken in Region 5.

Table 21 gives the results of these calculations of the rate in miles per day, together with the number of individuals on which the calculations are based. From this has been calculated the mean rate of travel.* In doing this all cases have been omitted which were based on (1) less than ten individuals, (2) a distance travelled of less than twenty miles, and (3) a retrograde migration relative to the mouth of the Fraser River. This has been done to exclude, as nearly as possible, all abnormal figures. With these exclusions there remain nineteen categories on which to base the final conclusions as to the rate of migration. The data for these nineteen categories are given separately in the following table:—

* This and other similar means have been computed by use of the "harmonic mean" recommended by Yule (An Introduction to the Theory of Statistics), Rugg (Statistical Methods Applied to Education), and others, for the calculation of mean rates based on units of work. The harmonic mean is defined by Rugg as "the reciprocal of the arithmetic mean of the reciprocals of the individual measures of the series."

Table 22.—Rate of Progress in the Nineteen Categories containing the Most Reliable Data.

Station marked.	Region where captured.	Distance travelled.	Specimens.	Rate per Day.
		Miles.	Number.	Miles.
A	1	35.0	12	12.5
	2	47.5	16	11.5
	6	60	23	10.5
	7	71	32	12.2
	8	83	25	11.1
	9	92.5	13	12.8
	10	122.5	14	11.7
B	6	21.5	25	9.3
	7	33.5	35	7.6
	8	47.5	56	10.1
	9	62	49	11.5
	10	92	54	14.6
C	7	33	20	5.9
	8	45	48	8
	9	59.5	28	9.1
	10	89.5	20	9.1
D	9	27.5	109	10.2
	10	57.5	35	6.8
E	10	30	166	4.5

Calculated from these figures the mean rate of migration is 7.8 miles per day. If the Canadian records are omitted, the rate is 9.7 miles per day.

Greene,* in his study of the migration of salmon (Chinook, silver salmon, and steelhead) in the Columbia River, obtained results quite different from these. He estimates that from thirty to forty days are usually required for the process of acclimatization to fresh water, during which time the fish work back and forth with the tides. After entering water which is wholly fresh he estimates the rate of travel of silver salmon and steelhead at 6.36 to 7.50 miles per day, although he concedes that this is only about one-third of the rate of travel as estimated by men engaged in the fishing industry and seems to imply that their figures are probably more reliable than his own. Greene's figures should be accepted with considerable caution on account of the comparatively few individuals marked and the fact that three species were represented and all combined to give his final results. The sockeye-tagging experiment has produced no evidence indicating that the migration is especially retarded during the passage from salt to fresh water. As may be seen from Table 15, there is no great difference in the time required to pass from American waters to the Fraser River, just within the mouths, and that required to pass above New Westminster, where the water is entirely fresh. Furthermore, as will be seen later, in the case of fish taken on or near the spawning-grounds in the tributaries, the time elapsed since marking averages between thirty and forty days, the time given by Greene as required for the process of acclimatization. It may be concluded either that Greene's results are wholly unreliable or that the migration of sockeye is quite different from that of the species studied by him, which is, of course, entirely possible. The rate of migration of the quinnat (Chinook) salmon of the Sacramento River as given by Rutter† is much more nearly in accord with the results of this sockeye study. He estimates the rate of progress through brackish water to average seven or eight miles per day and that through fresh water to be between fifteen and twenty miles per day. These figures apply only to the spring run on the Sacramento River. The migration of the fall run is considerably slower, averaging but four to five miles per day through the fresh water. Greene's observations were, of course, made upon fall-run fish.

A further analysis of data has shown some interesting variations in the rate of migration. A calculation of the mean rate of migration from each marking-station indicates that the rate of travel decreases as the fish approach nearer the mouth of the Fraser as follows: Station B, 10.5; Station C, 7.9; Station D, 9.1; Station E, 4.5.

* Greene, Charles W.: The Migration of Salmon in the Columbia River. Bulletin U.S. Bureau of Fisheries for 1909, Vol. XXIX., pages 129-148. Washington, 1911.

† Rutter, Cloudsley: Natural History of the Quinnat Salmon. Bulletin U.S. Fish Commission for 1902, Vol. XXII., pages 65-142. Washington, 1904.

Finally the rates of migration for different parts of the season have been calculated. The data given in Tables 1 and 2 were first condensed into quartiles and then into halves, and the rate of travel in miles per day was calculated for each of these. The positions of the quarter points determining the quartiles were based on the number of fish marked, not on the number returned. In adopting a central point on which to separate the halves it was rather arbitrarily determined to consider all fish marked during July as belonging to the first half and all those marked during August as belonging to the second half. It is more convenient to think of the halves as separated in this manner, and the central point separating the fish marked into halves comes sufficiently close to August 1st to warrant the division on this basis. These calculations have not been made for Stations C and E. The inaccuracies in the marking record at Station C would have made such treatment valueless. In the case of Station E, over 78 per cent. of the fish recovered were taken in Canadian waters. Inasmuch as the authors were unable to make a detailed analysis of the Canadian records, it has seemed best not to attempt too detailed an analysis of the records obtained from the marking at Station E.

Table 23.—Rate in Miles per Day in Different Quartiles—Returns from Station A.

In the case of the quartiles, the indications are that the rate is more rapid in the first than in the second quartile, and that the rates in the third and fourth quartiles are successively more rapid than in the second. This does not appear clearly in the results from Station D, especially when the returns from Region 8 are included. Omitting the returns from Region 8 (which is deemed legitimate, considering the comparatively short distance travelled, just twenty miles from Station D to the centre of Region 8) brings the results more nearly in accord with those obtained from Stations A and B, the only disagreement being in the rate during the first quartile. This is, in the case of Station D, slightly less, rather than greater, than the rate in the second quartile.

It seems not unlikely that the difference in rates of travel shown in the different quartiles may be explained as indicating racial differences existing in the fish composing different parts of the run. Gilbert* has demonstrated that the Fraser River run is composed of a number of distinguishable races, each bound to a different spawning region. The assumption that these races may have different rates of migration while passing through the waters of the sound does not seem to be a difficult one to accept.

* Gilbert, Charles H.: Contributions to the Life History of the Sockeye Salmon. Report, Commissioner of Fisheries for the Province of British Columbia for 1917, Paper No. 4, pages Q33-80. Victoria, 1918.

In the case of the halves, the results from all three stations are in complete agreement, indicating that the rate during the second half is distinctly more rapid than during the first half.

In connection with the above determination of the rate of progress through Puget Sound, it must be borne in mind that the rates are undoubtedly lower than they should be. This necessarily follows when it is considered that seldom less than one day, and frequently three or four days, elapses between the times when the traps are lifted and the fish reported. Again, the fish may spend some time in the hearts and pot of the trap before entering the spiller, from which they may be taken at the next lift. A fish entering the trap immediately after it has been lifted would not be reported before the next day at the earliest, thus adding at least one day to the actual time required to make the journey from the marking-station. If traps were uniformly lifted at twenty-four-hour intervals, twelve hours could with safety be subtracted from the average number of days en route and the rate calculated accordingly. The authors' knowledge on this point, however, is not sufficient to warrant such treatment. It would undoubtedly be a step in the right direction, but would tend to give an opinion that the rates have been fully corrected, which would be quite unwarranted by the facts. It is possible that the error involved is within the limits of error dependent upon other factors.

Returns from Tributary Streams and the Fraser River above Mission Bridge.

Returns were obtained from various sections of the Fraser River watershed which have not been included in the regions indicated on the map. These sections may be indicated as follows:—

	Specimens.
Main river, 3 to 27 miles above Mission	7
Main river, near Hope, Yale, Hell's Gate, and Spuzzum	16
Main river at Lytton and Lillooet	2
Main river at Soda Creek	2
Pitt River	6
Harrison Lake system, between Harrison and Lillooet Lakes	5
Harrison Lake system, Birkenhead River	9
Seton Lake system, Portage Creek	2
Chilcotin River	1

The complete data concerning these returns are given in Table 29. The mean dates on which the fish captured in each of the above districts have been calculated and appear in the summary. This was done in order to see, if possible, when the fish bound to the different tributaries were to be found in Puget Sound. We have suggested above the possibility of a segregation in time of the races demonstrated by Dr. Gilbert.

The data here presented are quite too fragmentary to afford a basis for more than the most tentative conclusions; but the following points are suggested:—

(1.) The fish which go farthest up the main river before turning into the tributary in which they are to spawn run earlier in the season.

(2.) The main bulk of the fish which pass up the main river past Hope are to be found in Puget Sound at the height of the season, the latter part of July and early in August.

(3.) The fish entering the lower tributaries, Pitt River and the Harrison Lake system, come largely from those fish constituting the last half of the run.

In the event that it were deemed desirable to stop commercial fishing for part of the season, it would seem that the first part should be selected, as the indications are that there is a larger proportion of the up-river fish in the first half of the run, and these are the fish which have suffered more severely as a result of the disaster of 1913.

SUMMARY.

(1.) The experiment of tagging adult sockeye salmon in Puget Sound was initiated in an effort to determine the routes and rates of migration of Fraser River sockeye in passing through the waters where commercial fishing is permitted.

(2.) During July and August, 1918, numbered silver or aluminium buttons were attached to 4,494 adult sockeyes. Of these, 1,199 were later recovered and data as to time and places of capture secured.

(3.) The route most commonly followed passes from the Strait of Juan de Fuca across Washington Sound to the Salmon Banks and Whidbey Island, then through Rosario Strait and the southern part of the Strait of Georgia, past Point Roberts to the mouths of the Fraser River.

(4.) The rate of migration as determined by the data for American waters is approximately ten miles per day.

(5.) The migration is more rapid during the last half than during the first half of the season.

EIGHTH ANNUAL REPORT

OF THE

SUPERINTENDENT OF INSURANCE

FOR THE

PROVINCE OF BRITISH COLUMBIA

1919

(BUSINESS TRANSACTED IN 1918)

PRINTED BY
AUTHORITY OF THE LEGISLATIVE ASSEMBLY.

VICTORIA, B.C.:
Printed by WILLIAM H. CULLIN, Printer to the King's Most Excellent Majesty.
1919.

To His Honour Sir FRANK STILLMAN BARNARD, K.C.M.G.,

Lieutenant-Governor of the Province of British Columbia.

MAY IT PLEASE YOUR HONOUR:

The undersigned has the honour to present the Eighth Annual Report of the Superintendent of Insurance for the year ended December 31st, 1918.

J. W. DE B. FARRIS,

Attorney-General.

Victoria, B.C., July 10th, 1919.

REPORT OF THE SUPERINTENDENT OF INSURANCE.

DEPARTMENT OF INSURANCE,
VICTORIA, B.C., July 10th, 1919.

The Honourable J. W. de B. Farris,
Attorney-General, Victoria, B.C.

SIR,—Pursuant to the "British Columbia Fire Insurance Act" and the "Insurance Act," I have the honour to submit herewith a report for the year ended December 31st, 1918, being the Eighth Annual Report of the Department, but the first to the Attorney-General as Minister under the Act.

I. "BRITISH COLUMBIA FIRE INSURANCE ACT."

(1.) FIRE INSURANCE COMPANIES.

At the close of 1918, 109 companies were licensed to carry on the business of fire insurance, the number being the same as in the previous year. Four are limited to insurance of automobiles against fire, as appears by the full list on pages 25, 26. The origin of the different companies is shown in the following table:—

Where incorporated.	Dominion Licensees.	Provincial Licensees.	Total.
Dominion of Canada	21	..	21
Provinces of Canada	5	..	5
Great Britain	32	..	32
Australia	1	..	1
Hong Kong	2	..	2
United States	43	1	44
France	4	..	4
Totals	108	1	109

Seven companies obtained licences during 1918, namely:—

American Alliance Insurance Company.
British Traders' Insurance Company.
Car & General Insurance Corporation, Limited.
The Fire Insurance Company of Canada.
New Hampshire Fire Insurance Company.
The North American Accident Insurance Company.
Queensland Insurance Company, Limited.

The American Alliance Insurance Company, formerly known as "German Alliance Insurance Company," has held a licence for some years, but had withdrawn from the Province. The North American Accident Insurance Company is limited to insurance of automobiles against fire.

The companies holding a Provincial licence which in 1918 obtained Dominion licences were as follows:—

Boston Insurance Company.
Fire Association of Philadelphia.
Mechanics & Traders Insurance Company.
National Benefit Assurance Company, Limited.
Newark Fire Insurance Company.
New Jersey Fire Insurance Company.
Northwestern Mutual Fire Association.
Union Marine Insurance Company, Limited.
Vulcan Fire Insurance Company of Oakland, Cal.

Six companies withdrew, all except the last named hailing from the United States. In every case the step was taken because their arrangements and circumstances did not warrant their complying with the requirements of the Federal "Insurance Act, 1917." It will be remembered that eight companies retired from the Province in the previous year for the same reason. Injury to the interests of the Province must have occurred through the removal of the competition of these fourteen companies. The companies ceasing business in 1918 were:—

Detroit Fire and Marine Insurance Company.
Industrial Fire Insurance Company.
Michigan Fire and Marine Insurance Company.
Minneapolis Fire and Marine Insurance Company.
Reliance Insurance Company of Philadelphia.
Svea Fire & Life Insurance Company.

As compared with 1917, the premiums showed an increase of more than $400,000, but, on the other hand, the losses paid were larger. It may be surmised that the changes in the figures were alike due to war hazards and the rise in values. The statistics will be found in Table I., pages 29, 30. A statement has been added to the table to indicate in some measure what other sums are disbursed out of the premiums collected, over and above the amounts paid for losses. The bald figures of premiums and losses are apt to convey the misleading impression that the balance is mainly profit. On the other hand, Table IV. demonstrates that the underwriting profit in this Province must be considerable, and in some measure justifies the claim for a reduction of the rates in force. It will be observed that, if we omit Prince Edward Island and the Yukon, British Columbia has the best record in Canada for the last three years.

(2.) FIRES.

The subject of fire-waste and fire-prevention has received a great deal of publicity, and it is quite clear that there exists considerable apprehension and alarm over the situation. The huge losses sustained by the country year after year are, it is recognized, a peril and contribute to the upward tendency of prices. In Ontario a league was formed, and is in active operation, for the purpose of fighting the negligence and carelessness, which lies at the root of the whole problem. While the organization is affiliated with the Fire Marshal's Department, it is founded on voluntary effort in the public interest. In this Province a similar league was established independently and simultaneously (indicating the degree to which public opinion is awakened) under the title of the "British Columbia Fire-prevention League." At the close of 1918 the league had not actually commenced work, because the appointment of its first executive was not complete, and it was felt to be of paramount importance that the officers should be men to whom the public would listen and who would devote real energy to the cause. At Ottawa the Dominion's Superintendent of Insurance called together a very similar body, and has established in his Department a special branch for fire-prevention work. There is no doubt in my mind that, even though these efforts do not bear fruit in the manner visualized by their promoters, results will come, and we can confidently anticipate that the community will before long be stirred to realize the vital necessity of diminishing the fire loss.

The work of the Department in the field of fire inquiry and inspection has been vigorously carried on by Mr. J. A. Thomas, who was appointed under the amendments of 1918 to the "British Columbia Fire Insurance Act." I cannot speak too highly of his efforts and enthusiasm, and am convinced that his services have already proved of the greatest benefit. It is obvious, however, that one man cannot cope with the work, and I submit for serious consideration the enlargement of the staff for this purpose. Ways and means are, of course, the serious factor in the present state of finances; but I may point out that in several Provinces a special tax of ⅓ of 1 per cent. of the premium income is levied on the fire insurance companies. The fund so formed is ear-marked as if it were a trust fund, for the sole purpose of fire prevention and investigation. The officials then appointed constitute an expert corps which not only carries out the instructions of the Department, but acts as auxiliary and advisory to the municipal and other officials who already exist.

The fire statistics (pages 31-39) are not so satisfactory as during the past few years. There is a considerable increase in the number of fires and the amount of loss. The latter figures for the first time exceed $2,000,000, making an average loss *per diem* of over $5,000 and a *per capita* loss of $5.25, with 400,000 as a round estimate of population for the Province. It

should be observed that the losses shown in Table I. comprise only losses covered by insurance. The difference between the two sets of figures, less the amount covered by unlicensed insurance, is absolute loss.

The larger figures for 1918 I ascribe in part to a more complete series of reports and to the enhanced values of property destroyed. With regard to reports, I may remark that the persons and companies responsible are filing them more promptly and in better shape than in the past. It is hoped that the importance of keeping these comprehensive statistics will be fully realized in order that effective steps may be devised for a reduction of the fire waste. In particular I should like to see a still further reduction in the number of fires of "unknown" origin. Experience gained by investigation will no doubt tend to produce that result. It is hoped, moreover, that the campaign for thrift and conservation will bear fruit and the figures for 1919 show a distinct improvement. No one who examines the statistics can fail to be struck by the numerous instances where carelessness only was the reason for the fire. Many of these fires are no doubt insignificant in themselves, but reviewed in the aggregate and with a realization of the danger attaching to every fire they are extremely serious.

Analysing the figures and comparing them with 1917, we find that the losses in the district municipalities are mainly responsible for the increased loss. Burnaby, Delta, Maple Ridge, Point Grey, and Richmond show considerably higher figures; the last named due to the conflagration at Steveston. Among the cities Vancouver's fires and losses alike record increases, accounting for 75 per cent. of the total losses in city municipalities. Its *per capita* loss is higher than the average for the Province. The showing of Victoria is highly creditable. In the table setting forth the causes of fires the increase in number of fires due to exposure is largely attributable to the Steveston fire. Sparks from different sources caused 25 per cent. of the total number of fires. There were four lives lost by fire during the year.

Fires involving a loss of more than $30,000 numbered eleven, and their importance may be estimated by the fact that their total loss amounted to $1,296,000, or over 61 per cent. of the year's loss. The balance of 39 per cent. was caused by 933 fires. These figures are striking, but tell the same story as any similar statistics for Canada and the United States. The eleven fires occurred as follows: Six on lumber-mill premises, one each in a shipyard, a factory, a warehouse, and a store, and one at Steveston. The practical importance of proper inspection is well illustrated by the Steveston fire, which was due to a defective stove-pipe. But the moral of these figures as a whole is that primary and continuous attention should be directed by all parties to the necessity of keeping plants of all descriptions free from fire hazards.

Five formal fire investigations were held under the "British Columbia Fire Insurance Act" as amended in 1918, and although no case of arson came to light, there is no doubt that the inquiries were beneficial. Apart from these, Mr. Thomas has conducted numerous investigations with the aim of preventing fires, and in that field has achieved fine results.

II. "INSURANCE ACT."

At the end of last year 107 companies held licences under this Act for the various forms of insurance other than fire. The list is printed on page 27 and followed by some statistics of their business. I append a summary of these companies:—

Where incorporated.	Dominion Licensees.	Provincial Licensees.	Total.
British Columbia	..	2	2
Canada	34	..	34
Other Provinces of Canada	3	2	5
Great Britain	20	10	30
Australia	1	1	1
Hong Kong	2	2	4
Japan	..	1	1
United States of America	29	1	30
Totals	88	19	107

During 1918 sixteen new companies were granted licences here, namely:—

British America Assurance Company.
British Traders' Insurance Company, Limited.
Car & General Insurance Company, Limited.
Continental Casualty Company.
Equitable Fire and Marine Insurance Company.
Great American Insurance Company.
Great North Insurance Company.
Maryland Assurance Corporation.
North American Accident Insurance Company.
Northwestern National Insurance Company.
Phoenix Insurance Company.
Standard Marine Insurance Company.
Tokio Marine & Fire Insurance Company.
Western Empire Life Assurance Company.
Western Life Assurance Company.
The World Marine & General Insurance Company, Limited.

All hold Dominion licences, except the Western Empire Life Assurance Company, which transacts life insurance, and the Standard Marine Insurance Company, Tokio Marine Insurance Company, and the World Marine Insurance Company, Limited, which transact only marine insurance, for which no licence is issued at Ottawa.

Two companies withdrew, the North American Accident Insurance Company and the Western Life Assurance Company, both having been absorbed by the companies of similar named mentioned above; Federal Acts of incorporation replacing Provincial Acts.

Five companies were issued supplementary licences, as follows:—

Employers Liability Assurance Corporation, Limited (automobile, burglary, steam-boiler, and plate-glass insurance).
General Accident Assurance Company of Canada (guarantee insurance).
Great American Insurance Company (marine insurance).
Guardian Insurance Company of Canada (automobile insurance).
Home Insurance Company (explosion insurance).

The business done in the field of life insurance again shows a large increase, and well over $100,000,000 of life insurance is now in force in the Province. Life insurance is one index to the conditions of trade, and high wages with continuous employment are generally reflected in more new policies, fewer lapsed policies, and a smaller number of loans secured by policies. The campaign for thrift, however, should help the agents not only to secure new business, but to persuade policyholders to keep up their insurance, even though work and money should be less plentiful than during the war period. No separate figures are available to show whether the companies were called on for heavy payments owing to the epidemic of influenza, but it may be inferred from the amount of policies which became claims during 1918 and of the unsettled claims that the ravages of the disease here were responsible for a large proportion. The statistics are given on pages 41, 42, the summary on page 42 for a five-year period being a new table.

The total premiums received in 1918 for the miscellaneous forms of insurance show an increase of more than $200,000 over the previous year. The figures for health and accident insurance, automobile insurance, and marine insurance indicate a larger volume of business, while employers' liability declined. The number of companies ready to write the various forms of automobile policies has grown from thirty-two to thirty-nine. As the use of the automobile spreads the owner realizes how essential it is for him to be protected against the risks incident. The expansion of the ship-building industry accounts for the larger amount of marine insurance. The development in health and accident insurance is a good sign and likely to continue. The epidemic of influenza has brought home to the public the value of insurance against sickness, while the number of motor accidents emphasizes the need of protection in the case of accident. The usual table for miscellaneous insurance appears on pages 42-44, and a new table covering a period of five years on page 42.

III. GENERAL.

In October, 1918, a conference took place at Regina of the Superintendents of Insurance for Ontario, Manitoba, Saskatchewan, and Alberta. I was invited to attend, but did not feel that the subjects for discussion justified the length of absence necessary. The principal matter was a model set of statutory conditions for health and accident policies, a draft of which had been in my hands for suggestion and criticism. The meeting was pleased to accept a number of suggestions made by me and practically settled a draft. It remains for the draft to be submitted to the various Provincial Governments. The conference was noteworthy for the fact that it was the first at which the representative for Ontario was present.

The Legislature at its session this year carried into practice the principle of uniform legislation by enacting a new "Fire-insurance Policy Act." The statutory conditions contained in the Act are practically identical with those in force in Alberta, Saskatchewan, Manitoba, and Ontario. The other amendments to the Statutes relating to insurance do not call for special mention.

Allusion should be made to the resolution of the Legislature that "early consideration by the Government of legislation with respect to State Health Insurance . . . is desirable." It is a matter fraught with great potentialities for both success and failure. State insurance of this kind has, of course, been in existence for many years in Germany and for some few years in England, but in America it is a novelty. There has been recently much debate and close investigation by our neighbours across the line, and in some States the question has been put to the vote of the people; for example, in California, where it was rejected. The arguments pro and con are naturally very numerous and the considerations involved of grave importance. It may be asserted that the experience of England and Germany is of little value in determining whether such proposals are practicable in this Province. The conditions of the population and the area affected, both leading factors, are so different. There is a large body of opinion in the United States adverse to such State insurance, and the most notable element of the opposition is the American Federation of Labour, which is absolutely hostile. The public here seems to be little acquainted with the subject and its ramifications, and the hope may be expressed that the press will thoroughly investigate it before urging either its adoption or rejection.

The losses by fire having during recent years grown to such perilous dimensions, legislation respecting prevention of fire was enacted in April last by Parliament. Provisions have been embodied in the Criminal Code, making negligence under certain circumstances a crime. The amendments are so important that I feel they should receive as much publicity as possible, and have therefore set them out at length on page 46 of this report.

Last year I ventured to suggest in my report that the Insurance Acts referred to in the foregoing pages should be consolidated, and the experience of another year has confirmed the view I then entertained.

There is, too, an increasing number of insurance agents in favour of legislation which would make a licence a necessary qualification before any one could act as such agent. Other Provinces and many States have a law of this kind, and I believe I am correct in saying that everywhere it has proved of high value, not only to the public, but also to the insurance fraternity. The subject deserves early consideration.

I have the honour to be,
Sir,
Your obedient servant,
H. G. GARRETT,
Superintendent of Insurance.

APPENDIX.

INSURANCE OTHER THAN FIRE INSURANCE.

Annual Statement of Provincial Licensees for the Year ended December, 31st, 1918.

PERSONAL NEGLIGENCE NOW CRIMINAL OFFENCE.

An Act to amend the Criminal Code respecting prevention of fire was passed by the Senate on April 8th and House of Commons on April 23rd, 1919, and reads as follows:—

"His Majesty, by and with the advice and consent of the Senate and House of Commons of Canada, enacts as follows:—

"1. Section 515 of the Criminal Code is amended by inserting the following subsection immediately before subsection (2) thereof:—

"(1*a*.) Every one is guilty of an indictable offence and liable to two years' imprisonment who by negligence causes any fire which occasions loss of life or loss of property.

"The person owning, occupying, or controlling the premises in which such a fire occurs, or on which such fire originates, shall be deemed to have caused the fire through negligence if such person has failed to obey the requirements of any law intended to prevent fires or which requires apparatus for the extinguishment of fires, or to facilitate the escape of persons in the event of fire, if the jury finds that such fire, or the loss of life, or the whole or any substantial portion of the loss of property, would not have occurred if such law had been complied with.

"2. The said Act is further amended by inserting immediately after section 515 the following section:—

"515A. When any Dominion, Provincial, or municipal fire officer or authority recommends to the owner, lessee, or other person controlling or operating any building, structure, factory, shipyard, vessel, dock, wharf, pier, sawmill, or yard in which logs or lumber are stored or held, that any reasonable change, alteration, or addition should be made in or to such building, structure, factory, shipyard, vessel, dock, wharf, pier, sawmill, or yard with a view to safeguarding life or property from destruction by fire, or that any material should be removed therefrom with such view, or that any apparatus should be supplied therefor with such view; and if such recommendation is approved by an officer in the service of His Majesty, thereto authorized by the Governor in Council; and if notice of such recommendation and approval has been personally served upon such owner, lessee, or other person; and if, after the expiration of thirty days from the receipt of such notice, such owner, lessee, or other person refuses, neglects, or otherwise fails to carry out such recommendation to the satisfaction of the officer in the service of His Majesty hereinbefore mentioned, such owner, lessee, or other person shall be guilty of an indictable offence, and shall be liable to a fine of not exceeding one thousand dollars, or to imprisonment for any term not exceeding six months, or to both such fine and imprisonment."

VANCOUVER, B.C.

BALANCE-SHEET AND STATEMENT

OF

RECEIPTS AND DISBURSEMENTS

AS AT

MARCH 31ST, 1919

VICTORIA, B.C.:
Printed by WILLIAM H. CULLIN, Printer to the King's Most Excellent Majesty,
1919.

To His Honour Sir Frank Stillman Barnard, K.C.M.G.,

Lieutenant-Governor of the Province of British Columbia.

May it please Your Honour:

I beg herewith respectfully to present the Financial Statement of the University of British Columbia for the year ending March 31st, 1919.

J. D. MacLEAN,

Minister of Education.

May 7th, 1919.

VANCOUVER, B.C., May 3rd, 1919.

The Hon. J. D. MacLean, M.D., C.M.,
Minister of Education, Victoria, B.C.

SIR,—At the meeting of the Board of Governors held on April 28th the Financial Statement for the fiscal year ending March 31st, 1919, was presented, and it was ordered that copies be sent to you, together with the explanatory letter prepared by the Bursar.

Yours very truly,

L. S. KLINCK,
Acting-President.

UNIVERSITY OF BRITISH COLUMBIA.

BALANCE-SHEET AND STATEMENT OF RECEIPTS AND DISBURSEMENTS.

VANCOUVER, B.C., April 28th, 1919.

The Chancellor and Board of Governors,
The University of British Columbia,
Vancouver, B.C.

DEAR SIRS,—I beg to submit the following annual statements for your approval:—

Balance-sheet as at March 31st, 1919, and statement of receipts and disbursements for the period from July 1st, 1918, to March 31st, 1919.

UNIVERSITY SITE.

Since the last annual statement (June 30th, 1918) the sum of $4,294.71 was expended on sewer, extending electric-light line, water-piping, surveying, etc., on the University site at Point Grey.

BUILDINGS.

During the same period the poultry colony houses and fencing were erected at Point Grey at a cost of $3,599.02. The dairy, dairy-barn, bull-pen, and two foremen's cottages were completed under last year's contract at an expenditure of $12,536.49, making a total cost for these buildings of $23,825.59. The hay-barn and feed-store at Point Grey was also completed under contract at a cost of $5,559. This makes the total expenditure on buildings at Point Grey for the nine months ending March 31st, 1919, $21,694.51.

PROVINCIAL GOVERNMENT GRANTS.

The Provincial Government granted to the University the sum of $220,000 for the period from April 1st, 1918, to March 31st, 1919. A supplemental grant for $46,000 and a special grant towards buildings and maintenance of Forest Products Laboratory of $2,500 were also received, making total grants of $268,500 from the Provincial Government. Of this amount, the sum of $36,666.66 was received prior to June 30th, 1918, leaving the sum of $231,833.34 as the net Provincial Government grants received from July 1st, 1918, to March 31st, 1919.

Under the Dominion "Agricultural Instruction Act," I understand the Provincial Government were to receive from the Dominion Government the sum of $69,199.06, of which $8,000 was the amount allotted to the University for agricultural instruction throughout the Province. No payment has been received by the University on this account, although the sum of $1,027.50 has been expended by the University up to and including March 31st, 1919.

SCHOLARSHIPS.

The Royal Institution for the Advancement of Learning of British Columbia presented the University with eight Victory War Loan bonds for $1,000 each, bearing interest at 5½ per cent. per annum and maturing December 31st, 1922, as an endowment for the McGill Graduates' Scholarship of $2,500, the Shaw Memorial Scholarship of $2,500, and the Dunsmuir Scholarship of $3,000.

CO-OPERATIVE SEED-GROWING.

The amount received from the Dominion Government on this account for the nine months ending March 31st, 1919, was $1,062.41, of which the sum of $954.01 was expended, leaving a balance to the credit of this work of $108.40, plus a balance of $9.34 carried over from the previous year.

DEPRECIATION.

Ten per cent. depreciation, amounting to $81,776.79, has been allowed on buildings and equipment—this amount being added to general expenditures.

FIRE INSURANCES.

The amount of fire insurance in force at March 31st, 1919, was $187,135, distributed as follows:—

University buildings at Point Grey	$20,000 00	
„ „ at Fairview	58,500 00	
		$78,500 00
Vocational buildings at Point Grey	$ 9,800 00	
„ „ at Fairview	14,800 00	
	24,600 00	
		$103,100 00
Library books, etc.		40,100 00
Equipment		43,935 00
Total		$187,135 00

Unexpired fire insurance premiums at March 31st, 1919, amount to $3,299.67, and this has been shown on the balance-sheet as an asset of the University.

BOOK-STORE (STUDENTS' TEXTS).

Text-books to the amount of $5,834.40 were sold to students, showing a profit of $831.13, equal to 16½ per cent. The stock in hand amounts to $2,706.66, as against $1,305.85 the previous year. This is accounted for through the fact that after ordering and receiving texts new heads of departments were appointed in English and History, who changed certain of the text-books for the year. I am informed that these texts will be used to a large extent next year.

PRODUCE AND LIVE STOCK.

Produce and live stock amounting to $3,400.76 was sold during the period July 1st, 1918, to March 31st, 1919, and credited to general expenditures. Details of this appear in statement of receipts.

DEPARTMENT OF SOLDIERS' CIVIL RE-ESTABLISHMENT.

For the period July 1st, 1918, to March 31st, 1919, the University has disbursed for buildings, salaries, supplies, and equipment for the above department the sum of $84,795.91. From July 1st, 1918, to January 31st, 1919, this was operated through the University bank account, but owing to the delay in receiving remittances from the Dominion Government, it was found that the financing of this department seriously affected the credit of the University bank account. It was therefore decided to open a special bank account on January 31st, 1919, thereby enabling us to finance within our Budget.

Your obedient servant,

F. DALLAS,

Bursar.

BALANCE-SHEET AS AT MARCH 31ST, 1919.
